This procedure should be acceptable to all concerned. First, if the ailment is chronic rather than acute, no harm can come from the use of the process of physical rebuilding through food and the nutrilites, since the ailment has likely been plaguing the person for considerable time and the sufferer is still alive. A few months devoted to rebuilding the body can hardly make things worse. Second, if the ailment is acute, in addition to the physical rebuilding through food and nutrilites, medical aid is solicited. Should the trouble prove to be of such a nature as to require medicine, the presence in the patient's body of building and regulating materials can only aid the medical treatment. Any physician who is interested in getting his patient well (and naturally the physician is interested in this) will want his patient as well nourished as possible, and he would no more think of objecting to a good diet supplement for his patient than he would think of putting all his patients on a 30 day fast. Third, no matter how well nourished the body may be, we all need to think correctly, and certainly, no practitioner, psychologist, psychiatrist or mental healer could object to a person being well nourished while the process of right thinking is developed.

And so when we supply our bodies with all the necessary building and regulating materials we have everything to gain and nothing to lose. If we get well in step 1 (use of full nutritional supply) we save a lot of money otherwise spent for examinations and treatment. In step 2, the medical treatment required is more effective in the well fed body. And in step 3, any mental reeducation is facilitated when the brain and nervous system are properly nourished.

So we find -- and this is very important -- you do not have to make a far reaching and momentous decision between diet and drugs, between physical methods and mental methods or between nutritional science and Christian Science. To the extent that you need them or want them, you can have them all. As a matter of fact, "mens sana in corpore sano" is a good goal. We all need a sound mind in a sound body. And we need a sound body without any foreign elements. If you have germs -- get rid of them. If there are poisons in your body -- get rid of them. If you are afflicted with wrong thoughts -- get rid of them. But at the same time, down underneath, you need a body which is constantly being supplied with its vital building and regulating materials.

* * * * * * *

Now we have made a little study of the history of vitamins, we have seen what happens when certain of the well-known vitamins are omitted from our diet, we know something of the attitude of the medical doctors toward this subject and we know just how to proceed when we experience any physical or mental ailment of any kind.

In concluding this section we should point out that no one knows how many vitamins there are. There may even be twice as many as are known, or assumed to exist. But they have one character in common -- they all originate in plant material. And the nutrilites, you remember, are ALL the little vital food factors, including the familiar vitamins. So if you want to be really stylish and up-to-date, you should talk about the nutrilites, and not just the vitamins. And if you want to be healthy, you will make sure that your daily diet includes not only all the vitamins, but all the nutrilites.

Now, be sure to remember this: the American diet is deficient in nutrilites, the protective food factors. Why is this true? Why are we sick and ailing in this land of plenty? Why don't we get all the vitamins and minerals we need?

23

Enemies of HEALTH

- DEPLETED SOIL
- IMPROPER COOKING
- PROCESSING; STORAGE & SHIPPING DELAYS

Resulting in : devitalized, demineralized and denatured foods!

An Ex-Secretary of Agriculture says:

"50% of the people in the United States do not get enough in the way of protective foods (containing vitamins and minerals) to enable them to enjoy full vigor and health."

Lela E. Booher, Chief of Foods & Nutrition Div., U. S. Bureau of Home Economics informs us:

"The chief fault of many American diets is that they provide too little of the essential minerals and vitamins.

English Academy of Medicine, LANCET, states:

"99% of common illnesses are due to or are superimposed on vitamin deficiencies."

OUR ARMED FORCES KNOW • They supplement the diets of our fighting men with vitamin concentrates.

On the previous page you just read the answer. You are probably not getting the elements you need, because depleted soil, improper cooking, processing, storage and shipping delays produce devitalized, demineralized and denatured food.

As to storage and shipping, consider an orange. An orange stored thirty days loses some of its vitamin value. Cold storage preserves food, but not one hundred per cent. Therefore, your friend and my friend in Chicago or New York gets his fruits and vegetables with a lowered value. Shippers are planning, in the future, to stop shipping fresh fruits and vegetables in railroad cars. Instead, we will put them on a plane tonight and twelve hours later they will be in New-York.

As a matter of fact, possibly you saw that clipping in the Los Angeles Daily News about the 6th of July, 1945. An American Airlines C-39 giant four-motored airfreighter carried fruit and vegetables from Salinas, the "Salad Bowl," to Cleveland. The plane loaded the produce, picked early Wednesday morning, left at 9 A.M., and the fruits and vegetables were being carried home from the Cleveland markets the next morning. Contrast that twenty-four hours with twelve times that and you will know what it means to have fresh fruit in Cleveland.

Now consider the matter of processing. The beriberi which afflicts the Orientals, who eat a lot of polished rice, is the result of processing. In this country we eat polished rice, and also white flour. Do you know why they give us white flour and why it is so hard to get whole wheat flour, and good whole wheat bread? Because millers discovered that white flour would store well without getting rancid, and that weevils would not get into the processed flour. Either the weevils had more sense, or they didn't find enough nourishment in the white flour. Anyway, that's the reason for white flour. And just as the weevils can't live on it, we can't either. It's what we don't eat that makes us sick.

Sugar is another item which is highly processed. The negroes of the tropics who chew the sugar cane get sugar and minerals and vitamins, but we who eat the refined sugar from the cane, do not. And further, the white sugar actually draws on the body's stores of certain nutrilites necessary for the chemical processes as the sugar is converted into energy, so that white sugar not only doesn't give us the nutrilites we need, but it takes from us some that we already have. A double loss.

Most of us like meat, potatoes, and gravy. We are not good vegetable eaters, but even if we were, would we get the nourishment we need? In the preparation of cabbage, as an illustration, you put a nice green head of cabbage in the pot and it comes out something between tan and brown. The chlorophyll is gone as well as the vitamins and minerals which are quite soluble in the cooking water. Even if the cabbage was as good as it should

be to start with, which is not always true under modern cultivation, storage, and transportation, it certainly is not as good as it should be when it is finally cooked and served. The drain pipe gets most of the good food and you and I get what is left.

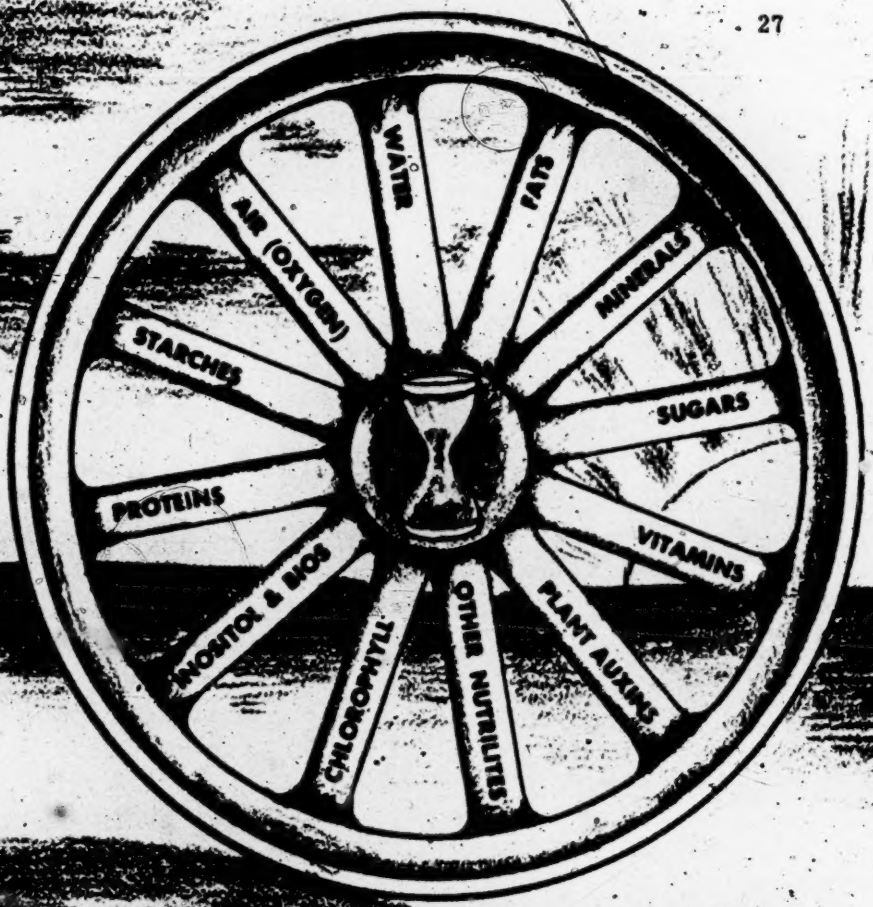
The greatest enemy of all is depleted soil. We have known that for a hundred years, but we have done very little about it. Way back in the days of Thomas Jefferson it was recognized that the soil in Virginia was being depleted, because the quality of the tobacco crop was falling off. So Thomas Jefferson bought most of the rest of the United States for some ten million dollars. He had to have more rich, fertile soil to grow good tobacco. Now, today, the government, both state and national, is trying to sell the farmer the idea of remineralizing the soil.

As time goes on we shall see more and more remineralization of the soil, but now it is being rapidly demineralized. You have often passed some field, I'm sure, where vegetables are grown. You see them take off one yield after another, with just enough remineralization and fertilization to grow a good looking crop. The farmer doesn't care anything about the mineral content of his plants -- just their appearance and taste, for you buy according to looks and taste. So the food grown in that soil can't have as much food value as it should. It is impossible to take out, over and over, putting very little back, and have good food.

On the other hand, here is an example of what happens when the soil is properly mineralized with respect to only one of the essential elements. In Deaf Smith County, Texas, a dentist moved in to start his practice. But business was poor, and when he investigated, he found that practically nobody had any decayed teeth. The residents of Deaf Smith County didn't need a dentist because fluorine, in addition to other elements, was present in the vegetables and in the drinking water leached through that soil in quantities great enough to produce perfect teeth. So right now, they are starting to import water from Deaf Smith County into other states, in ten thousand gallon lots. But, unfortunately, there isn't enough water in Smith County to go around. Although it is a fine example of the protective value of minerals, it doesn't solve our own health problems.

Why are we having so many common health problems nowadays, whereas a hundred, or two hundred years ago they were not nearly so general?

Great-grandpa used to take the grain to the mill and bring back the whole flour for bread and cereals. Today the grain is shipped to the mill where all of the bran and germ is taken from it, then a chemical is used to bleach it. Most bakers use other chemicals to make it rise when making bread and cakes. Result -- you and I do not get what our great-grandparents used to get in the old days.



Then remember too, great-grandma's vegetables were likely grown in virgin or at least good soil, while today much of civilization's soil has been used so often and so intensively that it has become demineralized.

What does all this mean? It means that in order to compensate for the losses caused by refining and processing, storage, canning and cooking, and also due to the lack of minerals in the soil, we eat two and three times as much food as would otherwise be necessary.

This results in overloading our stomachs, overworking our livers and kidneys, and eventually a break-down of one or more of these vital organs. And in addition, we are spending more than we should for food, because we have to eat so much -- and even then our bodies are not properly nourished.

The wheel of life is only as strong as the weakest spoke of which it is composed.

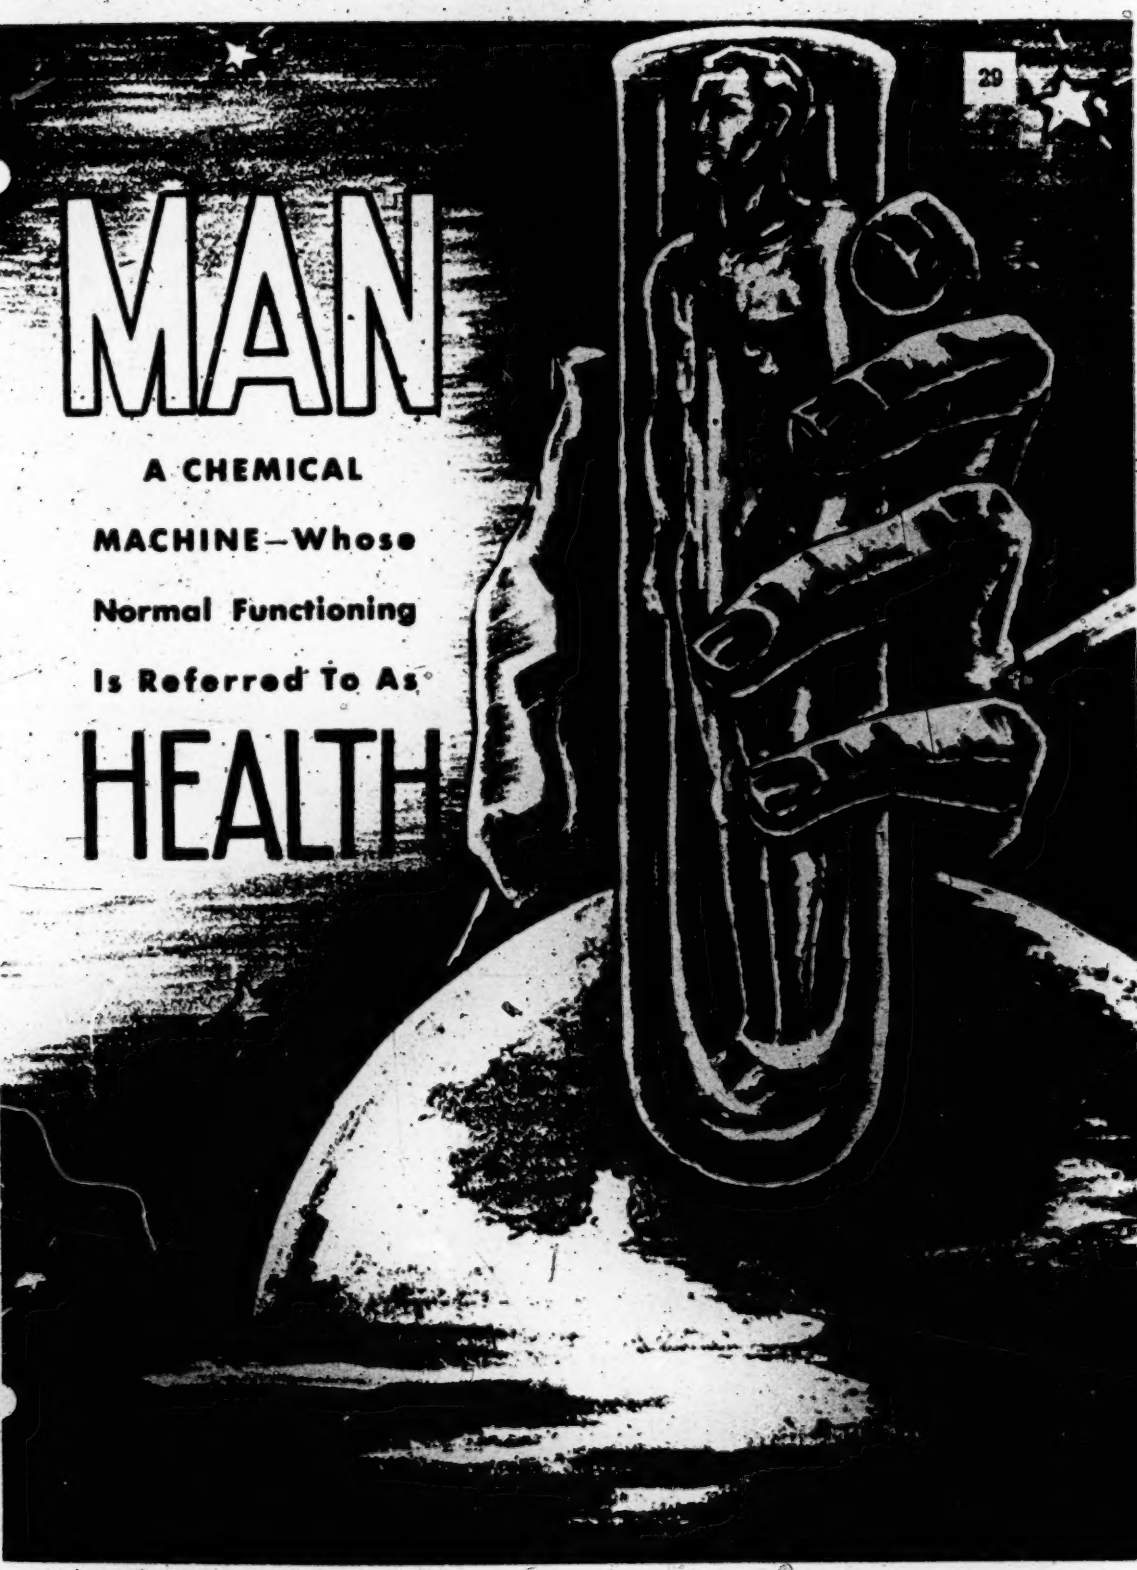
27

WHEEL OF LIFE

like any wheel designed to bear a burden, is only as strong as the spokes of which it is formed. Should any of its supporting substances be missing or fail, the wheel is weakened and, as time goes on, it may break down unless these vital elements are restored.

The body must have all the proteins, sugars and starches, nutrilites, and minerals which make the spokes strong. Just deny the body any of them and what happens? You have a flat wheel. Deny yourself air and water and you know what will happen; again, a flat wheel.

Your body will do its best to live on any food you give it. This has been demonstrated by the people in the concentration camps. They lived on potato peelings and polished rice. They didn't live well, they lost weight, they lost their teeth, and many of them lost their minds, and a lot of them have flat wheels they can never overcome. Your body, too, develops a flat wheel when your diet does not contain the elements needed.



The flat wheel you develop as the result of diet deficiencies may show itself as one of the common or not so common deficiency diseases, including those most responsible for death in our 40's and 50's, whereas we should live in good health and vigor, and with full possession of our faculties, to the age of 90 or 100.

But long before the deficiencies show outwardly in the adverse physical conditions with all the medical names, there is the evidence of the deficiency showing itself in changes and upsets in the body chemistry.

Chemical and biological sciences have established the fact of the chemical nature of the life process and that living things of all kinds must be in chemical balance to be normal. Most of the ills and diseases of human beings are unnecessary -- they are the result of chemical starvation of our bodies for substances vitally necessary to life.

So much of the operation of the body is chemical in nature that Man is often referred to as a chemical machine. How this is possible is partially explained as follows. You can take some cold nitric acid and some cold copper, put the copper in the acid, and soon both the acid and the metal are hot. That is a chemical reaction. And in the same way, when you put cold food into your body, and the body converts it into heat to keep you warm -- that, too, is a chemical reaction. Thousands and thousands of chemical reactions take place in your body every second of every day, and you don't know anything about what is going on.

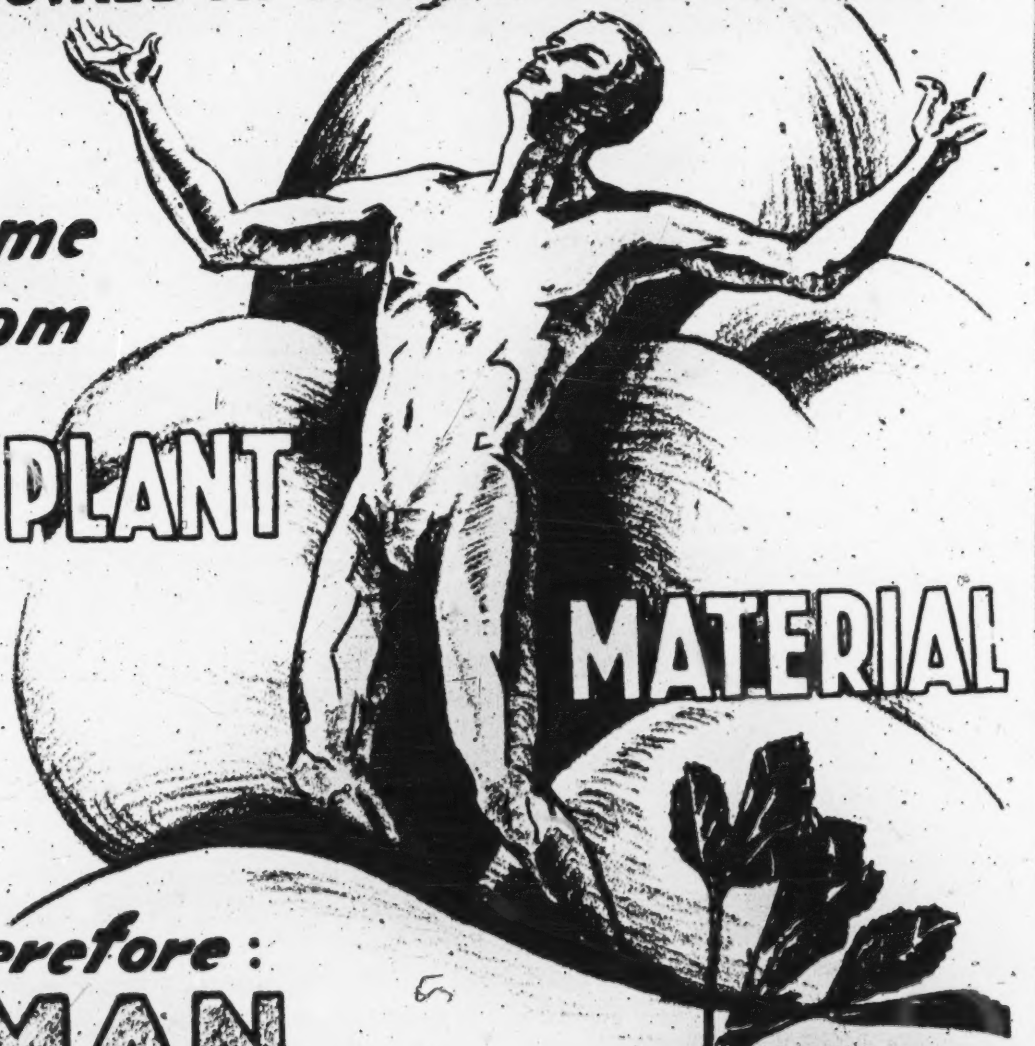
This is not a fad but the opening of a door to a new way of life and living for all mankind. It has to do with the accessory food factors so small in bulk that although they have always existed in foods they have only recently been recognized.

29
MAN
A CHEMICAL
MACHINE—Whose
Normal Functioning
Is Referred To As
HEALTH

How simply man could have health if he could be placed in a test tube, where his chemical reactions, metabolism, and general aches and pains could be studied. But while he can't be studied that way, modern nutritional science has been intensively studying him for the past forty years.

There are two words doctors use that often confuse us. One is the word metabolism. "Your metabolism is out of balance," they say, or "Your basal metabolism is way too low." Now this word "metabolism" -- what does it mean? Few people know. But the doctor doesn't use the word to confuse you. It's just his scientific way of expressing himself. He refers to the chemical changes in living cells by which the energy is provided for the vital processes and activities, and by which new material is assimilated to repair the waste. If your basal metabolism is low, it means that this chemical process is not very productive of energy and new material.

Another word the doctor uses is "allergy." He will tell you you are allergic. We heard a doctor say recently that almost everything wrong with us was due to some sort of allergy. He means the body has become so sensitive, that a certain something, otherwise harmless, will cause trouble. One little girl we know is allergic to feathers. When feathers are near her she breaks out in a sort of rash. Some people are allergic to pollens of weeds, or flowers. Some are allergic to cats. A doctor told me recently of a man allergic to sunlight. Allergies seem so popular, it's a wonder someone doesn't say he is allergic to his wife, and claim a divorce.



Now it may be perfectly true that your body is sensitive to certain things, and that you really do have an allergy. But this is the big question -- why is your body so sensitive? It isn't enough to know your allergies, and then try to avoid the irritants. The real need is to get your body so adjusted that you won't be so sensitive -- so you won't have the allergies. And here is what the doctors will likely be saying 25 years from now. "There is something wrong with your body chemistry if you have an allergy, and the allergy can be eliminated by your own body, automatically, if you will just give your body all the material it needs to restore its chemical balance."

Your body is a chemical machine, and always the chemical balance must be maintained. When your body gets out of chemical balance, you are ill. When you get into chemical balance and stay there, you are well. That's health in a nut shell, and that's what we find when we put man in a test tube and study him.

Now -- what keeps our body in chemical balance? In other words, what makes us well, and what keeps us well? Here is the story.

31

all of the factors REQUIRED in HUMAN NUTRITION

therefore:

MAN

is dependent upon the

PLANT KINGDOM

for

HEALTH

Once a man had a little calf. It was a cute little brown calf with a white face. The man took the calf out to his pasture -- one of those ideal pastures in a beautiful valley, so all year round the calf could find plenty of food, and water from the stream.

The man left the calf there, with some salt, and took a trip around the world. He was gone a year. When he returned to his calf he found, as we would naturally expect, that it wasn't a calf any more at all -- it was a cow. It was a great big cow, with horns and hooves and a long tail.

As the man stood there by the fence and gazed at his cow, he began to wonder where all the material came from that wasn't there when he left. What made the horns, and the hair on the tail, and the hard material of the hooves?

Obviously, it all came from the grass, since that is all the calf had to eat, with a few leaves, possibly, which it may have nibbled from a young tree.

Now, believe it or not, where the material came from, to make the cow, is important to all of us, for we too grow up in the same way. We too start as a very small animal, and we finish as adults with hair, teeth, bones, finger nails, inner organs and muscles not possessed at first. (Of course, some of us don't have any hair or any teeth when we're grown up, but that's all part of the story too.) As we grow up the hair and teeth grow -- they have to be made of something. Where does the material come from?

You say, it's in the food we eat. It's in all the stuff we put into our bodies -- in the meat, potatoes, milk, bread, candy, coffee, ice cream, pancakes and fruit, vegetables and nuts. Anyway, we hope it is.

It's much like building a house. Suppose you build a brick house, but while it is being built, the bricklayers substitute a lot of wooden boxes, made to look like bricks, for the real bricks. Obviously in an earthquake or big storm, you would lose part of your house. Or a wall might come tumbling down at almost any time. So you call some more bricklayers and they put in a lot more of the imitation bricks along with the good bricks. Everything looks all right, and you think you have done a good job in taking care of your house, but actually your house is still weak, ready to fall apart, and it will stay weak until you get every imitation brick replaced with a good brick.

How many imitation bricks do you suppose you have in your body? It's pretty hard to tell, of course, but here are some facts and figures that will give us an idea of the condition of the bodies of us Americans.

Children die every year in this country from malnutrition. Notice it is not in Europe -- not in Japan -- nof in China during a famine -- but

right here in this country. According to the Bureau of Education, 50 per cent or more of our children in schools need medical attention of some kind. Four million of the boys drafted for army service were rejected for physical defects and inability to serve.

According to a recent study made by a large and well-known eastern college, only one in a thousand is not suffering from deficiency -- from malnutrition. This means that no one can safely say: "I am perfectly healthy and my body is sound and well nourished."

Think of our population, and think of all the common ailments. Pick up any newspaper and you read of prominent citizens dying in early middle age of the various diseases that claim the lives of so many. Think of the people you know who are ill right now, and suffering, without relief.

This would certainly make it look as though each of us might have a body containing many imitation bricks, so that we look reasonably well, we can get around and do some work, but either we are now experiencing some deficiency disease, or we are ready to come down with one.

If this is the case however, if our diet is so deficient and we have so many imitation bricks in our bodies, how does it happen that we continue to live and get along even in an unsatisfactory manner?

The answer lies in the constant attempt being made by the body to adapt itself to its food.

34 THE HUMAN BODY *adjusts itself to its* FOOD SUPPLY

COMPARE the Sikh—huge, powerful fighting man—and the Madrasi—weak, puny, ailing. Blood brothers of the same ancient race, *nutrition* has made them what they are in the 20th Century. Living cramped in areas where the soil has been devitalized through centuries of cultivation, the Madrasi weighs under 100 pounds and his statistical (average) life span is less than 20 years. But the Sikh, living in the hills, cultivating only virgin soil, grows well over six feet and is proud of his 250 pounds of bone and brawn.

The two men pictured are blood brothers. The difference in size between these two groups -- the Sikh and the Madrasi -- is the result of diet. And right here at home we find that the Japanese reared in the United States are seven per cent larger, in general, than Japanese reared in Japan. The lack of vital food elements stunts growth, and a full supply of the vital food elements promotes growth.

A good illustration of the effect of food in plant life is the hydrangea. Normally an hydrangea has an orchid-pink bloom. Sometimes you will see one an orchid-pink and another a pale blue. Why? All in diet. There are some blue herons in Florida. The herons in the zoo in New York are white. For a long time they thought there was a basic difference, until they captured some of the Florida herons and took them to New York to the zoo. In a year's time, there was no difference -- just another white heron.

Here is another illustration of what diet does. Diet deficiencies bring on old age. And the diet deficiencies can bring about all the evidences of old age when the person is still in his teens! We are all acquainted with the evidence furnished by the German and Japanese prison camps, as well as the concentration camps for civilians, and we have seen the pictures of the emaciated people. On the extremely deficient prison camp diets, young people showed all the symptoms of old age, and middle aged people died with all the appearances of old age.

We know that diet deficiencies bring on aches and pains. If you don't believe that, just try living on white bread and water for a few months. Further proof, of course, comes from the laboratories where the experiments with rats show the close relationship between diet and health.* Most of our common diseases, with the exception of germ diseases, but including some of the most painful, the most common causes of death from illness, those with the weirdest names, many rare diseases, and many which are considered incurable, are the result of dietary deficiencies.

And so we find that, simply through changes in diet, you can change the size of a race of people, change the color of a flower or bird, alter the coat of an animal, bring on premature old age, create a wide variety of aches and pains and illnesses, bring about death or, when the person is deficient, feed him back to health!

Any food supplement which is right, and which is able to protect you from the ravages and pain of the deficiency diseases, must contain all the vitamins, including those which cannot be bought in the drug store, together with all the nutrilites and minerals so often lacking in our diet.

*See Hygeia for September, 1947, pp. 684 ff.

The whole question is this -- do you want to be on top of the heap, feeling fine, thinking clearly and accomplishing things, or do you want to be on the bottom of the heap, ill, ineffective, suffering?

How to Get Well and Stay Well

IF your health problem is the result of dietary deficiencies, and IF you want to get well and stay well, be sure to read this book. Even IF you are sure your diet has nothing to do with your ailment, read this book now, because science is connecting more and more physical troubles with diet and nutrition. IF your health is good read this book and learn how to stay well.

FOREWORD

One of the most difficult accomplishments in writing is to use words, phrases, clauses and sentences in such a way that the reader gets exactly the impressions and understanding the writer is trying to convey.

We have done our best to include only truthful and factual statements in this book. As statements that might be misunderstood or misconstrued are brought to our attention, they are changed. These changes are made monthly, as a new printing of this book comes off the presses every thirty days.

On the other hand a certain obligation also rests with the reader. This requires him to take what is written and do his best to grasp the author's meaning without reading into it ideas and notions not expressed or intended.

Consider, for example, our title -- HOW TO GET WELL AND STAY WELL. From this title do you conclude that we offer every person a means of getting well, whether he is breathing his last few breaths at the age of 110, on his death bed with cancer, in a diabetic coma or about to die of typhoid fever? If so, your conclusions are wrong. With the title of this book be sure to read the explanation on the title page, below the illustration. What we have tried to do in this book is show the average American, ill with the usual American deficiency ailments in the customary chronic manner, what may be the cause of his illness, and how he should proceed to get well and stay well.

Another example: When you read the title of this book do you assume that we are going to show you how to stay well, in spite of everything you do to the contrary? If so, it is also a wrong conclusion. You can follow our suggestions contained herein, and still make yourself ill by drinking too much alcohol, by taking dope, by overdoing, by exposure or by denying yourself certain important items of diet, such as proteins or carbohydrates.

Please remember, then, that this book is designed to bring you some little-known or not-often-thought-of facts about your health and the health of your family. We have done our best to be strictly truthful, and we simply ask you not to read into our words any ideas or meanings that are not there.

ARE YOU A VICTIM?

ARE YOU SUFFERING FROM HIDDEN HUNGER?

ARE YOU SLOWLY STARVING TO DEATH?

"Preposterous," you say. "I'm an American citizen. I'm not a war casualty living on a sub-standard ration, nor a victim of famine in China. I'm an American citizen, and I live in the best-fed nation in the world!"

Our message is important to you for the very reason that you do live in the United States, and because you do eat our modern American diet! Why? Just look around you at the members of your family, at your neighbors, friends and relatives -- at yourself. Can you find even three or four who are absolutely and completely well? Are you enjoying perfect health?

On the other hand, think of your friends and relatives, one after the other, and note how many are weak and lacking in energy, having trouble digesting their food or suffering with actual stomach pains, with decaying teeth, trouble with their hearts and other important organs, and with aches, pains and discomfort in various parts of their bodies. Think of your friends and relatives and note how many, in the last six months, have been to doctors or hospitals for treatment. Think of those who should be having physical help of some kind, but who are not receiving it. And finally think of people you know, your age and younger, who have died in the last year, prematurely.

Now, having thought about yourself and the members of your family, you probably feel that although some of the members of the family may be in poor health the rest are in good health.

So it might be interesting to check yourself, relatives and friends against the following requirements for health:

First -- appearance. The healthy person is good looking. His features may be irregular and far from the usual classic model, nevertheless the inner condition of health shows in a good complexion and clear skin (even for the teen agers), in sparkling eyes, a ready smile and a general air of alertness and life.

Second -- odors. The healthy person smells good. Most of the really unpleasant human odors come from a sick body.

Third -- energy. The healthy person is energetic and active. Lazy people are usually sick people. The healthy man or woman carries on his customary daily activities without fatigue. Should he be a little tired at the end of the day, the fatigue passes away by the time he has finished dinner, and no artificial stimulant or relaxer is needed. At the end of his regular day's work, the healthy person is soon ready for an active evening, carrying on his hobbies or social life. At bed time he is comfortably sleepy. He falls asleep at once, and enjoys a good night's sleep, without interruption from his body, and with no, or almost no, dreams. The healthy person awakens in the morning, eager for another active and interesting day. And during the day or evening, at any time, the healthy person is physically ready and able to put on a comfortable pair of walking shoes, and take a long hike, with pleasure.

Fourth -- feelings. The healthy individual feels good. He has a constant awareness of his body functioning properly and feeling good. He enjoys getting hungry, he relishes his food, and he enjoys the feeling of well-being which comes with his healthy digestion. He enjoys exercise, likes to get tired occasionally, and appreciates a rest. He never complains of his physical condition, since it is always good.

Fifth -- happiness. The healthy person is happy. He is calm and relaxed, with his abundant energy under control. His thinking is clear, and this, coupled with his energy, and full use of his faculties, enables him to earn a satisfactory living. Being healthy, he is not easily upset or disturbed. He has a good disposition. The healthy individual, whether child or adult, is easy to live with and he has fewer social problems.

Now -- what do you think? How many of the people in your family meet these health requirements? How many of your friends measure up to these standards? Do you? Don't you think the facts point to the need for something?

WHAT GOOD HEALTH MEANS TO YOUR BODY

Having seen what good health means to you, let's see what good health means to your body.

All your senses -- sight, taste, touch, hearing, and sense of smell operate in your body, and they depend, consequently, on your physical condition for their correct operation. If your sense organs, and your brain and nervous system have been supplied constantly with all essential materials for their growth, maintenance and operation, and your body chemistry is normal, then, barring accidents, you will be in full possession of your faculties. If your sense organs have been partly starved, you will have difficulty seeing, hearing, or functioning in other ways.

Your brain is one of your most important organs, and it operates in close association with the spinal chord, for the control of muscle movements. When the cells of the brain and nervous system are properly nourished, and the body chemistry is correct, the thought and behavior processes proceed normally. Damage to the brain or nervous system, whether due to accident or to breakdown due to insufficient supply of building material for the cells, usually results in at least a partial inability to move the various parts of the body, (stroke or paralysis) and at least a partial breakdown of the thought processes (confused thinking).

Your heart is, to put it mildly, one of your most useful organs. While the body is resting it pumps approximately one and one-half gallons of blood through your arteries and veins every minute. When your heart functions normally and beats regularly and strongly you go along like a $10,000 car running down hill. But when you fail to supply your heart with the necessary materials to keep it constantly rebuilt, and when your body chemistry is bad, your heart breaks down, and you acquire one of the various forms of heart trouble due to dietary deficiencies.

Glands are nice to have, too, in good working order. Some endocrinologists say that our glands determine our personalities. Certainly it is true that when the body chemistry is bad, or the glands themselves begin to waste away due to failure to keep them supplied with the necessary building material, our personalities do undergo enormous changes, and the whole operation of the body becomes a burden.

Teeth, also, are useful. Perfect teeth are possible, and decaying teeth are sure signs of a body which is falling apart.

Now it might be interesting to study your family, your relatives, friends and yourself along these lines too, and see how you all check up. Do any of you have difficulty seeing, hearing, or failure of other sense organs? Does anyone have to be careful not to overexert? Any with extreme personality changes? Any with false teeth? Any other evidence of failure of the various organs and glands of the body? Any illness, breakdown or invalidism? Any weakness or incapacity?

Nobody wants to be ill. Nobody chooses to have a body racked with aches and pains. But the fact remains that various deficiency ailments sneak up on us, and unless we take proper precautions now, eventually we may find ourselves bound, and in the power of some deficiency disease, if it has not occurred already.

Here is an extract from a clipping in the New York Times, printed June 29, 1945. "The record of 33 per cent rejections for women (applying for admission in the WACS) indicates an even more serious health situation

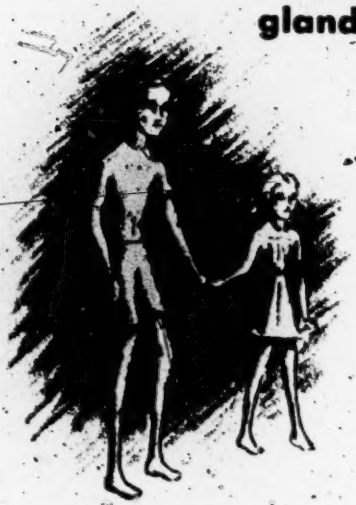
for women than the 40 per cent rejection rate does for men," said Dorothy La Salle, in charge of the girls. "It is to be remembered that these women were all volunteers, and at least thought of themselves as being well enough to join the W.A.C.," she said. "I am sure that if we could have a complete cross-section of the women between the ages of 20 and 50, a much higher rejection rate would be found."

That's interesting, isn't it? It means that you can think you don't need additional amounts of the protective health factors -- and yet be wrong.

A survey made by a large eastern college shows that out of 2511 people studied in Pennsylvania, 2509 lacked the proper nutrition. Only 2 persons out of 2,511 were receiving the vitamins, minerals and proteins they needed! Further, this same survey shows that, in all communities studied, regardless of economic status, the average diets of the children were far below the required daily intake levels recommended by the National Research council.

Along these lines is an interesting article in the American Magazine for October, 1947, titled "We Feed Our Hogs Better Than Our Children," in which it is pointed out that one-third of the population actually suffers from hunger -- from lack of nutrition -- and that we are much farther advanced in animal nutrition than we are in the science of human nutrition.

Here are some more facts --



22 MILLION Children

NEED CORRECTIVE TREATMENT — U.S. CHILDCLINIC

10 MILLION
have bad teeth

6 MILLION
are suffering from a glandular disturbance

4 MILLION
are improperly nourished in other ways

1 MILLION
have tuberculosis

1 MILLION
have spinal curvatures

WHAT'S WRONG?

Did you know that twenty-two million children in the United States need corrective treatment, ten million of them have bad teeth, six million are suffering from glandular disturbances, four million are improperly nourished in other ways, one million have tuberculosis and one million have spinal curvature -- and even the curvatures may originate in deficiencies in protective food values?

Unhealthy, sickly, malnourished children are a thorn in the flesh. Being sickly, they are petulant or sullen. Being malnourished, their nervous systems do not operate correctly, and they learn with greater difficulty, both in school and at home. In addition there is the bother, trouble and expense occasioned by the constant treatment required, if the child has some definite ailment. And finally, there is the blight put upon the child's whole future, when he gets a wrong start at home.

In the First World War, we rejected 20 to 25 per cent of the men and women eligible for service. Twenty-five years later, in the Second World War, we rejected about 32 per cent -- considerably more. Fifty-two and one half per cent of those called up for service had some disability.

And remember, your 4-F was, in almost every case, a 4-F when he was eight years old -- not suddenly when he was eighteen or twenty-eight. This means that if you don't want sickly children, you must see that they are properly nourished, and if you want healthy adults you must see that they are well nourished as children.

SOME OBVIOUS CONCLUSIONS

This little study of the children of America shows that millions of children all over the country, are ill.

Your study of yourself, the members of your family, your relatives and friends has shown you that almost <u>everyone</u> is more or less ill.

When you become ill, it costs money and time and trouble to get well again. It robs you of working time. And <u>it hurts</u>!

Obviously it is better to <u>keep</u> your body in splendid condition. But if your body has already begun to break down, as is the case with most of us, and which you recognize through your aches, pains, inconveniences and doctors' diagnoses, you can still do much toward returning it to it's basic and natural condition of health.

But before we tell you exactly how to do this -- let us tell you a story.

The Story of a REMARKABLE DISCOVERY

Nearly Thirty Years Ago,

CARL REHNBORG, a young man of Swedish descent, majored in biochemistry in an eastern university, and in time became associated with one of the largest manufacturers of American canned milk. He was selected by this company as their representative in China -- to introduce this product to the mothers of Chinese babies. But he soon learned that this was a very difficult assignment.

He tried to convince these mothers that his company's famous product would make their babies fat and well, but everywhere he turned he came up against the stone wall of Chinese indifference. The Chinese had never used dairy products -- babies had always been nursed.

Finally, although he was not a medical man, he decided to establish a demonstration clinic. He went into the slums of the great city, where poverty, ignorance, filth and disease had created an appalling death rate among the new-born, and opened a tiny nursery. Here desperate mothers, frantic to the point where they were willing to grasp at any promise of hope for their starving, ailing infants, placed them in his care.

Mr. Rehnborg's belief in his company's product was genuine. Yet weeks of feeding one of the most highly advertised and recommended American canned milk products to these sick Chinese babies brought disappointing results. The milk was being carefully formulated, but apparently milk was not the whole answer.

植物的生命就是人類的生命

Having specialized in the chemistry of foods, and having taken part in some of the early vitamin research experiments, he was convinced that the vitamins, the various minerals, and certain other essential diet factors as yet unidentified, were present in many raw foods. But apparently they were absent or deficient in most cooked foods. It was not even certain that cow's milk contained the best concentrations of all of them -- at least for human infants.

He believed these essential food factors were most highly concentrated in green plants, from which the milk-givers and all other animals finally secured them. The therapeutic food value of green growing plants had been further indicated to many observers by the fact that even the meat-eaters among the animals, including man's own dogs and cats, almost invariably exhibited a tendency to eat grass as a conditioner, especially when ill.

So, with continued feeble health or early death facing his infant patients, Mr. Rehnborg went out and gathered quantities of green grass, alfalfa, and other fresh green plants -- scrubbed them thoroughly to rid them of all foreign matter, then carefully dried and ground them to a powder. Mixed into a thin gruel, he fed this powder to the babies, along with their milk.

Almost at once some of his little charges began to show improvement. Some of the babies in the clinic, by now expanded to several times its original size, began to take on weight at a more normal rate. They became more active and commenced to throw off the visible symptoms of the various illnesses with which they had been afflicted.

But not all of them. Some still failed to show the hoped-for reaction.

But the man who held their future life and health in his hands was convinced that now he was on the right track. He suspected that the chemically worn-out soil of China was deficient, so that plants grown in it could not supply the consumer with all the required minerals, and probably did not even contain the normal quantities of vitamins and other essential organic substances they should produce. So he subjected samples of the soil to chemical analysis. When this theory was verified by the test tube he leased ground of his own, and plowed the minerals, which were lacking, into the soil. Thus he grew his own green plants, containing a full complement of essential food factors as he recognized them.

And when his plants were harvested, processed, and added to the diet of the babies in his clinic, not one failed to respond as expected!

The visible results from having fed these Chinese babies on a diet rich in all the vitamins and minerals then recognized as essential, (plus other food factors which he assumed were equally essential to health because

they were normal components of normal plants, although their essential character was not then proved), convinced him that he had developed a practical formula for more perfect chemical balance for the body, which would help restore normal organic function, increase resistance to infection, and contribute to the upbuilding of the body so that it could throw off symptoms of disease and maintain complete health.

Therefore, he still further perfected this food supplement by his own elaborate and ingenious extraction processes, discarding the nonessential cellulose and other parts of the plants, so that much value could be concentrated in small volume, and then tried the supplement formula on adults.

It is well-known that life in the Orient has always had a deteriorating effect on members of the white race. The big companies which sent men to China to represent them never kept these representatives on the job for more than about three years at a time. They were then given six months furloughs to return to their own countries. The reason for this was that by the end of two or three years, most Americans and other "foreigners" had reached a run-down condition which only a long vacation in their native country could mend. The climate in China was presumed to be the basic cause of the foreigners' bad health! Having discovered the vitamin and mineral deficiency in Chinese-grown food, our chemist reasoned that this deficiency, rather than climate, probably was the cause of much of the ill health among Americans in the Orient.

True enough, Americans fed on his specially prepared supplement were better able to withstand the deteriorating effects of life in China. These men returned to the United States in as good health as when they left.

When Mr. Rehnborg returned to the United States in 1927, he began a six year period of intensive study and experimentation, to improve his food supplement. At last, in 1933, when he considered his formula sufficiently developed to warrant making his food supplement available to the public, he started to manufacture it, on a small scale, in Balboa, California. This all led to further development and improvement and the creation of the present amazing food supplement, designed to supply the elements lacking in the standard American diet.

"All very interesting," you say, "But what does this have to do with me? I still think I eat a good diet. I certainly pay enough for it!"

HERE IS AN EASY CHECK ON YOUR DIET

What are some of the mistakes we make in feeding ourselves, and in feeding our families?

You probably eat white flour products, and the members of your family eat white flour products -- white bread, cake, pie, doughnuts, macaroni, spaghetti, soda crackers and refined breakfast foods. But you wouldn't feed your race horse or other prize animals on grain from which various important items had been removed.

You eat your food, grown on any old kind of soil, and you likely give it little thought. But if you owned valuable race horses, you would want your hay shipped from the blue grass region of Kentucky, or grown on re-mineralized soil.

Now why do we do our best to put the proper materials in our automobiles, and why do we make a scientific study of the feeding of prize animals and stock, while at the same time we feed our families, our children, and ourselves in a thoughtless and haphazard manner, and then wonder why our children, our wives and husbands, and we ourselves become ill?

Here is the answer. We have simply failed to carry over to our own feeding, the scientific knowledge we have learned in the raising of stock, the developing of prize animals, as well as in laboratory nutritional experiments with rats and other laboratory animals. And we have not learned that the body operates like an automobile inasmuch as neither will run efficiently if we put defective materials into them. The result is that almost all members of our families have bodies which are malnourished, and show evidences of the malnutrition which causes most of our common deficiency ailments.

Why have we failed to extend our rational feeding to include ourselves and our families? One reason is that we become accustomed to certain food, we like the taste of it, and we don't want to change. Another reason is that most people simply don't know how to get the foods which contain the essential elements even if they are willing to change. Another reason is that to get the necessary elements into our daily diet requires a little effort, and it costs some money, whereas to drift along is easier and cheaper now, even though eventually there may be pain, incapacity, doctors' bills, hospitalization, or death.

So the purpose of this book -- and the objective of the person who lent you this book -- is to bring you to the point where you will recognize the fact clearly that your illness and the illness of your family is, in almost every case, the result of a failure to supply your body and the bodies of the members of your family with the vital food factors. You must realize that if you wish to preserve your health and the health of your wife or husband, have healthy, happy children, fight off the common deficiency diseases yourself, and enjoy vibrant health and an active old age, YOU MUST PUT INTO YOUR BODY ALL THE FOOD FACTORS REQUIRED BY IT.

This book tells you how to do this, and it supplies the answer to the enigma of modern medicine -- why some people get sick so easily, and get well with such difficulty.

We give you the true and correct answer, and it makes sense to anyone who has owned an automobile or who has raised stock, for automobiles which are repaired with new parts as fast as they begin to wear, run forever, and stock which receive a full supply of vital food substances are healthy animals. Albert Howard, for instance, in his book, THE SOIL AND HEALTH, tells about oxen properly and scientifically fed, resisting the hoof and mouth disease of oxen in adjoining fields, even when their faces were licked by the afflicted animals, reaching through the fence!

You wouldn't feed a $50,000 race horse on third grade grain grown in sections of the United States where the soil is known to be particularly deficient in minerals. You wouldn't feed a $5,000 prize-winning dog on table scraps. You wouldn't feed your chinchillas or your foxes, which you are raising for their fur, on just any old kind of food picked up here and there at bargain prices.

Doesn't it seem reasonable to give a little thought to what you put into the bodies of your wife or husband -- into the bodies of your children -- into your own body?

And remember your reward -- a good chance for the relief of deficiency ailments if you have any (and most of our current and common ailments result from deficiencies) and their prevention if you are now lucky enough to be free from them.

12

THE FORMULA OF TOMORROW

for the World of today

HEALTH

Includes the six
Basic fundamentals
For sound Health:

- SUNSHINE
- FRESH AIR
- PURE WATER
- PROPER EXERCISE
- SUFFICIENT SLEEP
- PROTECTIVE FOODS

Remember this... THE AMERICAN DIET IS DEFICIENT IN PROTECTIVE FOOD FACTORS

1833

In the foregoing illustration we find noted the six fundamentals of health, namely: sunshine, fresh air, pure water, proper exercise, sufficient sleep, and protective foods. Pure water, fresh air and sunshine we don't worry about in most parts of the United States. We have an abundance of all of them. If we lived in many other parts of the globe, the water question would be something to worry about. But we take those things for granted in our own communities. The need for proper exercise and sufficient sleep is known to every intelligent person.

Now consider the protective food factors -- those little things that you and I eat, that enable us to convert our ordinary foods into energy, new skin, blood and cells, and which make it possible for the body chemistry to operate correctly. These elements in our food are called, in the text books of the bio-chemists, nutrilites. That's a technical word you won't find in your dictionary, but it means all the little food factors -- not the fats, minerals, carbohydrates and proteins we hear so much about, but all the factors such as the vitamins, chlorophyll, bios, inositol, and many others.

Formerly we thought that all we had to worry about was the bulk food we could see on our plates -- the fats, carbohydrates, and proteins. Now we are learning about the vitamins and other nutrilites, and the history of their discovery is interesting.

There was a Swiss bio-chemist, whose name was Lunin, who was intrigued by the consideration that there would come a time when the growing population of the world would be so great that the ground available for growing foods would be insufficient to support them, and he conceived the idea that it might be possible to feed human beings, as it was possible to feed animals, on substances which were not commonly recognized as a food. To determine that this was a sound theory, he fed experimental animals on synthetic diets made up of the substances that science then thought were contained in foods. These experimental animals were fed pure carbohydrate in the form of corn starch, pure refined fats, and protein secured from milk and leached with ether until nothing but protein was left. To this mixture he added all the minerals that analysis showed were in the body, and then fed this diet to animals. In theory they should have been able to maintain life, but they all very promptly died. And successive experiments of similar character all failed, unless small quantities of natural green materials or milk were added to the diets. Lunin concluded that there were substances not yet discovered in foods which were essential to life.

By some strange indifference there was no further recorded investigation along those lines for another twenty-five or thirty years. At that time there was a Dutch physician in charge of a prison hospital in Java. The patients in his hospital were mostly suffering from an oriental disease called beriberi, which is a Malay slang word meaning "no can do," because

the men who have it are incapacitated. They are weak, suffer much pain and finally die.

The Dutch physician, Doctor Eikjman, noticed also that the pigeons around the prison yard seemed to have a similar disease. Their heads were drawn back and their wings and legs were partially paralyzed and they died. He also noticed that what they ate was chiefly the white grains of rice that fell from the chow bowls of the prisoners as they ate their meals. Because it was polished rice, as an experiment he fed the birds unpolished rice -- and they recovered. He then fed unpolished rice to the men, and they also recovered. But, Eikjman, being a physician, not a nutritionist, and dealing with a totally new effect, concluded that there was a toxic substance in the white grain of rice for which the antitoxin was in the rice hulls.

About the same time a Japanese physician was trying to stamp out the same disease in the Japanese Navy. He knew that the staple diet of the Navy men was white rice, and he concluded that the reason a diet composed chiefly of white rice causes beriberi was because white rice did not contain sufficient protein. So, picking a training ship, he arranged that the diet of the cadets on the training ship throughout the cruise should include beans, rather than rice, as a staple food. On the trip there was no beriberi whatever, and he felt this confirmed his theory that the reason for the beriberi was the lack of protein.

An American bio-chemist, Dr. Williams, who was then in the Philippines following these conclusions, advanced the completely new idea that the reason for the sickness was not something the sufferer had eaten, but was because there were factors, normally present in natural foods, the lack of which caused the disease. In other words, the sickness resulted from something not eaten. All that is known of these factors, which we now call vitamins, or nutrilites, has been discovered in the past forty years.

Very early in this investigation it was discovered that one of the principles involved was contained in butter fat and dissolved in fats generally. It was called "fat soluble principle A." Another principle, the lack of which was responsible for beriberi, was found to be water soluble and was called "water soluble principle B." Sometime around 1912 a scientist named Funk believed from his investigations that he had proved that the substances in question were amines; so, he proposed the name vitamines, or amines vital to (vita) life -- vita-amines. Later it was discovered that they were not amines and the final "e" was dropped and they were called vitamins. Fat soluble principle A became Vitamin A. Water soluble principle B became Vitamin B. Presently -- about 1919 -- we knew of Vitamin C and Vitamin D. Later it was discovered that Vitamin B was not simple, but composed of at least two factors, and when this separation had been established, it was discovered that the second of these factors was extremely complex. It is

now known to comprise not less than fourteen distinct values, and for convenience it is called the "B-complex."

From 1920 until 1930 the knowledge of the vitamin factors grew until there were about ten known. In the next ten years perhaps thirty more were discovered or postulated, and most of the first ten were made in crystalline form.

The idea that vitamins have specific action -- that A is good for this and B good for that -- is natural but incorrect. It started with the first discoveries that C was more or less specific for scurvy, B for beriberi, and D for rickets, and the general medical idea that diseases have antidotes.

Actually, each cell of the body needs most of the factors, both the vitamins and the minerals, and their action is general, rather than specific.

The deficiency diseases for the most part are secondary effects, like having your lawn dry out and die because your water supply failed, or like being stuck ten miles from any habitation because you ran out of gas. Vitamin B_1, for example, enables the body to dispose of the waste products produced in burning fuels in the body. If it is deficient, the "clinkers" accumulate, they have a toxic effect on the cortex of nerve fibers, and pain, paralysis, and beriberi result.

In considering the following statements about the effects of individual vitamins, it should be remembered that these are only partial statements -- just as saying that an automobile is good for taking the family on a picnic is only a partial statement of what can be done with a car.

Also, we must realize that the activities of these few vitamins are no more spectacular nor more important in the body chemistry than are the activities of all the other vitamins not so well known, all the other nutrilites, or all the minerals, the amino acids, carbohydrates and fats. On the contrary, Dr. Quigley in his NATIONAL MALNUTRITION, says, "A millionth of a miligram of biotin may be as important in the daily diet as three miligrams of thiamin." Thiamin is Vitamin B_1.

So when you read about the importance of these few vitamins we list below, remember it is just as though we told you how important it is to put water in the battery of your car. You would agree, but at the same time you would be thinking, "Sure, but it is also important that I put in oil, gas, water in the radiator, and keep the tires inflated." So when you read about the importance of these few vitamins, say to yourself, "Certainly, these well-known vitamins listed here are important, but I must also remember to put into my body an ample supply of all food factors. We simply talk about these micro-food factors here because they are the better known nutrilites, and because most people eat a diet deficient in nutrilites."

In reading about these better nown vitamins, we should warn you that you may run into a few technical erms. This is because this description is supplied by Mr. Rehnborg, and whenever he explains things to us, he always goes technical. So if you come upon a tongue-twister like "cocarboxylase," don't be surprised. Actually there aren't many tough words, and it is easy reading between them. But if you aren't interested at all in the behavior of these vitamins in the body chemistry, just skip over to page 19, to WHAT DOCTORS SAY ABOUT VITAMINS.

Vitamin A. Vitamin A raises the body's resistance to infections, especially infections of the respiratory tract, aids in correcting night blindness, and promotes growth in children. It preserves the integrity of the epithelial linings of the body -- the linings of the eye sockets, the mucous membranes that line the body cavities (nose, mouth, lungs, stomach, intestines, etc.), and the linings of glandular cavities. If there is too little A, these membranes "keratinize" -- that is, become scaly and horny instead of smooth and moist with their own secretions, and, among other things, they lose their capacity for normal function and they become more subject to invasions of bacteria. The outside skin tends also to become scaly and the eyes develop a conjunctivitis. The production of visual purple in the eyes is affected, and one is less able to see in dim light.

Vitamin A has an interesting link-up with Vitamin E in fertility, partly due to the keratinization of the epithelial linings of the sexual glands when it is deficient, but also in other ways connected with the development of cells, because it is an essential part of the nuclei of all cells.

Vitamin B_1. Vitamin B_1 is a typical example of the general fact that the action of the vitamins in the body is enzymatic -- that is, they form parts of enzyme systems which are to the chemical reactions of the body what a catalyst is to a reaction in commercial processes; for example, such elements as nickel and platinum, which cause chemical reactions to occur more readily and rapidly, without themselves being concerned in the reaction or used up in the reaction.

In a general sort of way, a vitamin-enzyme causes a reaction to occur, and the reaction in turn is part of the sequence by which another enzyme system is formed, which produces another reaction in the chain, which sets off the formation of another enzyme system, which produces yet another reaction, and so on forever. In the end the vitamin is still there, substantially unchanged, and is eventually excreted by way of the kidneys, so that the vitamins have to flow through the body in a constant stream.

When absorbed into the body, Vitamin B_1 and a phosphate radicle and a protein molecule unite to form a sort of super-molecule, which is an enzyme (in this case called cocarboxylase). Meanwhile sugar which is eaten is hydrolyzed in the stomach (by the action of other enzymes which

were added to it in the mouth as it was eaten) into "simple" sugar, glucose. This is absorbed and immediately converted in the liver to glycogen, or animal starch, and stored for use.

When insulin and thyroxin call out these stores for use as energy, the liver releases some reconverted glucose, the Vitamin B_1 enzyme causes it to be converted into glucose phosphate, and as such it is burned in the muscles for energy and the muscles move, while the released heat maintains the temperature of the body. The product of this burning is in part lactic acid, which the body may reconvert into glycogen and again store in the liver, but which is mostly broken down (degraded again with the help of Vitamin B_1) into its simpler constituents, ending after several steps in carbon dioxide and water, which the body gets rid of -- the carbon dioxide through the lungs and the water through the kidneys.

The sugar was originally made in a plant from carbon dioxide and water by the action of certain wave-lengths of light in the presence of the enzyme or catalyst, chlorophyll. The energy used in this conversion was stored as chemical energy in the sugar. Burning it in the muscles released the energy, and with the discarding of the carbon dioxide and water by the body we are back where we started, and the discarded carbon dioxide and water may be used by another plant to make sugar all over again. All the body has used is the energy of sunlight stored in the sugar molecule.

If there is too little Vitamin B_1, this process of degrading and getting rid of the waste is interfered with, and some of the intermediate products formed in the process of degradation, notably such compounds as methyl glyoxal and pyruvic acid, accumulate in the blood and body fluids, and are poisonous in excess to many tissues, but particularly to the cortex (gray active surface layer) of the nerve system, brain and nerves. The ability of these tissues to function is lowered, pain and paralysis result, and we say the individual has neuritis, shingles, beriberi, sprue or celiac disease. If the situation is not corrected, in time the individual dies, having suffered considerable pain in the process.

Vitamin B_2. The chief function of Vitamin B_2 seems to be in the formation of what are called "oxidation-reduction enzymes," by which it has to do with cell respiration. A cell picks up oxygen from the hemoglobin in the blood stream, but what actually happens is that the Vitamin B_2 enzyme associated with the cell does the picking up. It is like the mail hook at the station that grabs the mail bag from the train as it speeds past.

Vitamin C. Vitamin C is, among other things, the "cement" which holds the cells of organs and tissues together as a functioning group. When in scurvy there are hemorrhages in the capillaries under the skin, for example, it is because the capillary walls have lost this integration and do not hold the blood in its course, but allow it to escape among the surrounding cells.

The capillary wall is not a tube but merely a passage between cells from the point where the tiniest artery ends to the point where the smallest vein begins, so the weakness of the walls is a sort of flabbiness of the cells of the tissue being fed by the flowing blood. Another evidence of this flabbiness is that when you press down on the flesh of a sufferer from scurvy and then remove your hand, the depression remains and the flesh does not show any elasticity in springing back into place as healthy flesh does.

Vitamin C also appears to be the chief defense of the body against infections. A person with a fever, for example, uses from three to ten times as much of the vitamin as a person without a fever. This is why lemon juice is a favored drink for a fever patient. It has been known for generations that a fever patient craves acid fruits to drink, but lemon juice is not the best answer. Orange juice or grapefruit juice or tomatoes or Vitamin C tablets would be better. The patient can't drink enough lemon juice to get enough vitamins for his requirements.

Vitamin D. Vitamin D has to do with the metabolism (the chemical changes by which a living organism utilizes nutrients) of minerals. When it is effective in rickets it is because it enables the body to utilize calcium and phosphorus, but its effects also extend to all other minerals. The exact mechanism by which Vitamin D does this is still obscure.

Vitamin E. Vitamin E is called the "fertility vitamin." This is an accurate if indirect characterization, just as it is to call water a "thirst quencher." In some way not known, Vitamin E is essential to the maturation or ripening of new cells, and it therefore has its chief function where many new cells are ripening -- in a woman, the foetus of a new individual; in a man, the tubules of the testes where spermatozoa are forming.

If there is a deficiency of the vitamin, the woman is sterile because the foetus dies and is aborted, or is aborted before it has died because the placenta is developing inadequately. This "sterility" is not permanent.

In a man, the mechanism by which the sperms evolve from the protean cells of the tubules in the testes is interfered with, and they are incomplete and inactive. If it is of long duration, the deficiency for Vitamin E will result in permanent sterility.

Probably new cells form in muscle tissues. At any rate, in a Vitamin E deficiency there is a progressive paralysis of muscle tissues, especially, as might be expected, in a growing child, but also in adults.

Finally, Vitamin E seems to play some vital part in proper function of the brain cells, because in even partial Vitamin E deficiency there is a marked deterioration of mental vigor and the ability to think clearly or for long periods.

Vitamin B_6 has something to do with the integrity of cartilages.

Pantothenic Acid in some way is concerned in the metabolism of fats.

Niacin deficiency produces pellagra, with nervous, mental, muscular, skin, and digestive upsets, some of which may be partly due to other lacks.

This is a very partial list of "vitamin functions," and drives home the first statement, that vitamins are not specific but general in their action, and the "deficiency effects" which are listed are secondary and not primary effects.

WHAT DOCTORS SAY ABOUT VITAMINS

You will find many doctors who "prescribe" vitamins. You will find many doctors who recommend the use of various vitamin preparations you can buy in drug stores. You will also find doctors who recommend NUTRILITE.

But there are still many doctors who are antagonistic to the whole idea of health developed in a non-medical manner. To understand this attitude we need a little orientation in the field.

First, we must realize that many illnesses are caused by something foreign getting into the body (germs and poisons, for example) and that in these cases a recovery comes as a result of the use of something that will either throw out the foreign matter, counteract it, or accustom the body to it. The material used to overcome or cast out the foreign elements is usually called a "medicine."

That is the "medical" approach. It is used by medical doctors, and since much illness lies in this field, medical doctors are important and necessary.

Until recently it was thought that all, or almost all diseases were caused in this way, by the entrance into the body of some toxic matter or by germs. In fact, we have been accustomed to this explanation of disease for so long that it is only with great difficulty that we are able to think about any other possibility. For example, you remember that Eikjman, the Dutch physician studying the prisoners afflicted with beriberi, concluded that the white rice contained a toxic substance not contained in the unpolished rice. Had we been in his place, it is equally unlikely that we would have guessed that the prisoners and the pigeons became ill because of a lack of a micro-food factor.

But, as we have already learned, in the last forty years new discoveries have been made -- the vitamins and various other nutrilites. The old facts, mentioned above, are still the same, but new and important facts have been

added. The new facts are that many physical ailments and diseases are not the result of the penetration of the body by something foreign, but THE FAILURE TO PUT INTO THE BODY needed factors and materials, resulting in nutritional deficiencies.

In the mechanical world, it is the difference between a breakdown in your automobile occurring because dirt got into your carburetor, and one occurring because you failed to put in a new set of wrist pins when the old ones wore out.

With your pet dog it is the difference between its death due to poison administered by a neighbor, and failure on your part to feed the dog enough of the right kind of building material and regulating items.

With yourself, in the same way, it is the difference between fighting a particular disease with medicine to throw out the intruders, or forgetting all about the symptoms and their medical names, and putting back into the body the materials the body needs for health. In this way, you are not fighting any foreign element in the body, or trying to cure anything. You are adjusting your diet so your body can restore itself to normal. If, as a result, you find yourself without some deficiency disease you suffered with previously, that is very gratifying, but only a secondary result. The rebuilding of your whole body through the provision of necessary materials, is your primary purpose.

What complicates the whole picture is the fact that the two viewpoints (medical versus health through diet) are, in many cases, interrelated. A house may burn down, for example, because someone threw a lighted match in the window. And, you can also say in the same case that the devastating fire was due to the fact that the water supply was shut off.

In the same way, you can say the man's illness is due to the germs which entered his body. You can also say it is due to failure to feed his body properly, since a healthy body tends to resist germ invasions.

Actually, then, when a person has an ache or pain, a weakness wasting, unsatisfactory feeling, a lesion, a symptom, or loss of physical capacity--in short, when he is ill, there are three courses of action open to him.

(1) He can reason that since his body needs all necessary building and regulating materials anyway, whether ill or well, he must make sure his body is getting all these essential items for proper rebuilding and regulating, and he will add these to his diet. Then he can wait long enough to give the body a chance to rebuild, and see if that is all he needs.

(2) If his physical ailment seems to be acute, he can IMMEDIATELY UPON BEGINNING HIS BODY BUILDING THROUGH FOOD AND THE MICRO-FOOD FACTORS, consult a physician to determine whether or not his condition

might be due to poisons in his system or to germ invasion. If so, WHILE HE CONTINUES TO BUILD HIS BODY THROUGH FOOD AND THE NUTRILITES, he can have medical treatment.

(3) If his belief or his ailment indicates to him the need for spiritual, psychological, psychiatric or religious assistance, he can WHILE HE CONTINUES TO SUPPLY HIS BODY WITH ALL NECESSARY BUILDING AND REGULATING MATERIAL, have whatever psychological, mental or religious assistance he wishes.

This procedure should be acceptable to all concerned. First, if the ailment is chronic rather than acute, no harm can come from the use of the process of physical rebuilding through food and the nutrilites, since the ailment has likely been plaguing the person for considerable time and the sufferer is still alive. A few months devoted to rebuilding the body can hardly make things worse. Second, if the ailment is acute, in addition to the physical rebuilding through food and nutrilites, medical aid is solicited. Should the trouble prove to be of such a nature as to require medicine, the presence in the patient's body of building and regulating materials can only aid the medical treatment. Any physician who is interested in getting his patient well (and naturally the physician is interested in this) will want his patient as well nourished as possible, and he would no more think of objecting to a good diet supplement for his patient than he would think of putting all his patients on a 30 day fast. Third, no matter how well nourished the body may be, we all need to think correctly, and certainly, no practitioner, psychologist, psychiatrist or mental healer could object to a person being well nourished while the process of right thinking is developed.

And so when we supply our bodies with all the necessary building and regulating materials we have everything to gain and nothing to lose. If we get well in step 1 (use of full nutritional supply) we save a lot of money otherwise spent for examinations and treatment. In step 2, the medical treatment required is more effective in the well fed body. And in step 3, any mental reeducation is facilitated when the brain and nervous system are properly nourished.

So we find -- and this is very important -- you do not have to make a far reaching and momentous decision between diet and drugs, between physical methods and mental methods or between nutritional science and Christian Science. To the extent that you need them or want them, you can have them all. As a matter of fact, "mens sana in corpore sano" is a good goal. We all need a sound mind in a sound body. And we need a sound body without any foreign elements. If you have germs -- get rid of them. If there are poisons in your body -- get rid of them. If you are afflicted with wrong thoughts -- get rid of them. But at the same time, down underneath, you need a body which is constantly being supplied with its vital building and regulating materials.

* * * * * * * *

Now we have made a little study of the history of vitamins, we have seen what happens when certain of the well-known vitamins are omitted from our diet, we know something of the attitude of the medical doctors toward this subject and we know just how to proceed when we experience any physical or mental ailment of any kind.

In concluding this section we should point out that no one knows how many vitamins there are. There may even be twice as many as are known, or assumed to exist. But they have one character in common -- they all originate in plant material. And the nutrilites, you remember, are ALL the little vital food factors, including the familiar vitamins. So if you want to be really stylish and up-to-date, you should talk about the nutrilites, and not just the vitamins. And if you want to be healthy, you will make sure that your daily diet includes not only all the vitamins, but all the nutrilites.

Now, be sure to remember this: the American diet is deficient in nutrilites, the protective food factors. Why is this true? Why are we sick and ailing in this land of plenty? Why don't we get all the vitamins and minerals we need?

Enemies of HEALTH

- **DEPLETED SOIL**
- **IMPROPER COOKING**
- **PROCESSING; STORAGE & SHIPPING DELAYS**

Resulting in : devitalized, demineralized and denatured foods!

An Ex-Secretary of Agriculture says:

"50% of the people in the United States do not get enough in the way of protective foods (containing vitamins and minerals) to enable them to enjoy full vigor and health."

Lela E. Booher, Chief of Foods & Nutrition Div., U. S. Bureau of Home Economics informs us:

"The chief fault of many American diets is that they provide too little of the essential minerals and vitamins.

English Academy of Medicine, LANCET, states:

"99% of common illnesses are due to or are superimposed on vitamin deficiencies."

OUR ARMED FORCES KNOW

- **They supplement the diets of our fighting men with vitamin concentrates.**

On the previous page you just read the answer. You are probably not getting the elements you need, because depleted soil, improper cooking, processing, storage and shipping delays produce devitalized, demineralized and denatured food.

As to storage and shipping, consider an orange. An orange stored thirty days loses some of its vitamin value. Cold storage preserves food, but not one hundred per cent. Therefore, your friend and my friend in Chicago or New York gets his fruits and vegetables with a lowered value. Shippers are planning, in the future, to stop shipping fresh fruits and vegetables in railroad cars. Instead, we will put them on a plane tonight and twelve hours later they will be in New York.

As a matter of fact, possibly you saw that clipping in the Los Angeles Daily News about the 6th of July, 1945. An American Airlines C-39 giant four-motored airfreighter carried fruit and vegetables from Salinas, the "Salad Bowl," to Cleveland. The plane loaded the produce, picked early Wednesday morning, left at 9 A.M., and the fruits and vegetables were being carried home from the Cleveland markets the next morning. Contrast that twenty-four hours with twelve times that and you will know what it means to have fresh fruit in Cleveland.

Now consider the matter of processing. The beriberi which afflicts the Orientals, who eat a lot of polished rice, is the result of processing. In this country we eat polished rice, and also white flour. Do you know why they give us white flour and why it is so hard to get whole wheat flour, and good whole wheat bread? Because millers discovered that white flour would store well without getting rancid, and that weevils would not get into the processed flour. Either the weevils had more sense, or they didn't find enough nourishment in the white flour. Anyway, that's the reason for white flour. And just as the weevils can't live on it, we can't either. It's what we don't eat that makes us sick.

Sugar is another item which is highly processed. The negroes of the tropics who chew the sugar cane get sugar and minerals and vitamins, but we who eat the refined sugar from the cane, do not. And further, the white sugar actually draws on the body's stores of certain nutrilites necessary for the chemical processes as the sugar is converted into energy, so that white sugar not only doesn't give us the nutrilites we need, but it takes from us some that we already have. A double loss.

Most of us like meat, potatoes, and gravy. We are not good vegetable eaters, but even if we were, would we get the nourishment we need? In the preparation of cabbage, as an illustration, you put a nice green head of cabbage in the pot and it comes out something between tan and brown. The chlorophyll is gone as well as the vitamins and minerals which are quite soluble in the cooking water. Even if the cabbage was as good as it should

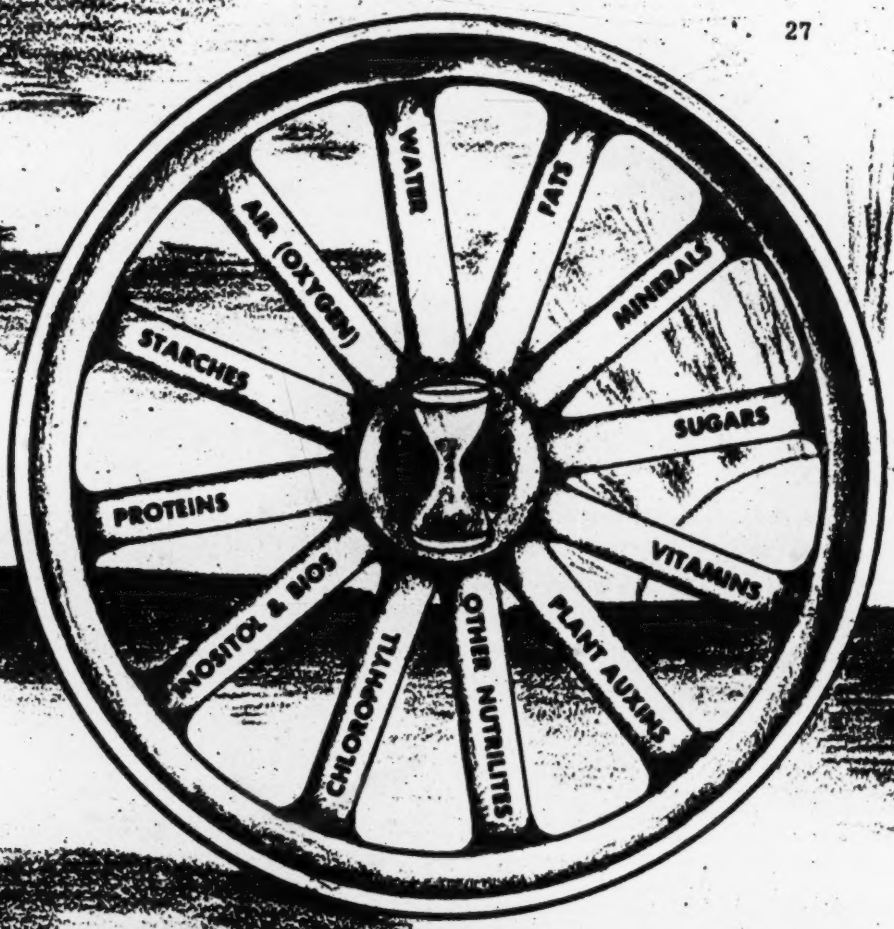
be to start with, which is not always true under modern cultivation, storage, and transportation, it certainly is not as good as it should be when it is finally cooked and served. The drain pipe gets most of the good food and you and I get what is left.

The greatest enemy of all is depleted soil. We have known that for a hundred years, but we have done very little about it. 'Way back in the days of Thomas Jefferson it was recognized that the soil in Virginia was being depleted, because the quality of the tobacco crop was falling off. So Thomas Jefferson bought most of the rest of the United States for some ten million dollars. He had to have more rich, fertile soil to grow good tobacco. Now, today, the government, both state and national, is trying to sell the farmer the idea of remineralizing the soil.

As time goes on we shall see more and more remineralization of the soil, but now it is being rapidly demineralized. You have often passed some field, I'm sure, where vegetables are grown. You see them take off one yield after another, with just enough remineralization and fertilization to grow a good looking crop. The farmer doesn't care anything about the mineral content of his plants -- just their appearance and taste, for you buy according to looks and taste. So the food grown in that soil can't have as much food value as it should. It is impossible to take out, over and over, putting very little back, and have good food.

On the other hand, here is an example of what happens when the soil is properly mineralized with respect to only one of the essential elements. In Deaf Smith County, Texas, a dentist moved in to start his practice. But business was poor, and when he investigated, he found that practically nobody had any decayed teeth. The residents of Deaf Smith County didn't need a dentist because fluorine, in addition to other elements, was present in the vegetables and in the drinking water leached through that soil in quantities great enough to produce perfect teeth. So right now, they are starting to import water from Deaf Smith County into other states, in ten thousand gallon lots. But, unfortunately, there isn't enough water in Smith County to go around. Although it is a fine example of the protective value of minerals, it doesn't solve our own health problems.

Why are we having so many common health problems nowadays, whereas a hundred, or two hundred years ago they were not nearly so general?



Great-grandpa used to take the grain to the mill and bring back the whole flour for bread and cereals. Today the grain is shipped to the mill where all of the bran and germ is taken from it, then a chemical is used to bleach it. Most bakers use other chemicals to make it rise when making bread and cakes. Result -- you and I do not get what our great-grandparents used to get in the old days.

Then remember too, great-grandma's vegetables were likely grown in virgin or at least good soil, while today much of civilization's soil has been used so often and so intensively that it has become demineralized.

What does all this mean? It means that in order to compensate for the losses caused by refining and processing, storage, canning and cooking, and also due to the lack of minerals in the soil, we eat two and three times as much food as would otherwise be necessary.

This results in overloading our stomachs, overworking our livers and kidneys, and eventually a break-down of one or more of these vital organs. And in addition, we are spending more than we should for food, because we have to eat so much -- and even then our bodies are not properly nourished.

The wheel of life is only as strong as the weakest spoke of which it is composed.

WHEEL OF LIFE

like any wheel designed to bear a burden, is only as strong as the spokes of which it is formed. Should any of its supporting substances be missing or fail, the wheel is weakened and, as time goes on, it may break down unless these vital elements are restored.

The body must have all the proteins, sugars and starches, nutrilites, and minerals which make the spokes strong. Just deny the body any of them and what happens? You have a flat wheel: Deny yourself air and water and you know what will happen; again, a flat wheel.

Your body will do its best to live on any food you give it. This has been demonstrated by the people in the concentration camps. They lived on potato peelings and polished rice. They didn't live well, they lost weight, they lost their teeth, and many of them lost their minds, and a lot of them have flat wheels they can never overcome. Your body, too, develops a flat wheel when your diet does not contain the elements needed.

The flat wheel you develop as the result of diet deficiencies may show itself as one of the common or not so common deficiency diseases, including those most responsible for death in our 40's and 50's, whereas we should live in good health and vigor, and with full possession of our faculties, to the age of 90 or 100.

But long before the deficiencies show outwardly in the adverse physical conditions with all the medical names, there is the evidence of the deficiency showing itself in changes and upsets in the body chemistry.

Chemical and biological sciences have established the fact of the chemical nature of the life process and that living things of all kinds must be in chemical balance to be normal. Most of the ills and diseases of human beings are unnecessary -- they are the result of chemical starvation of our bodies for substances vitally necessary to life.

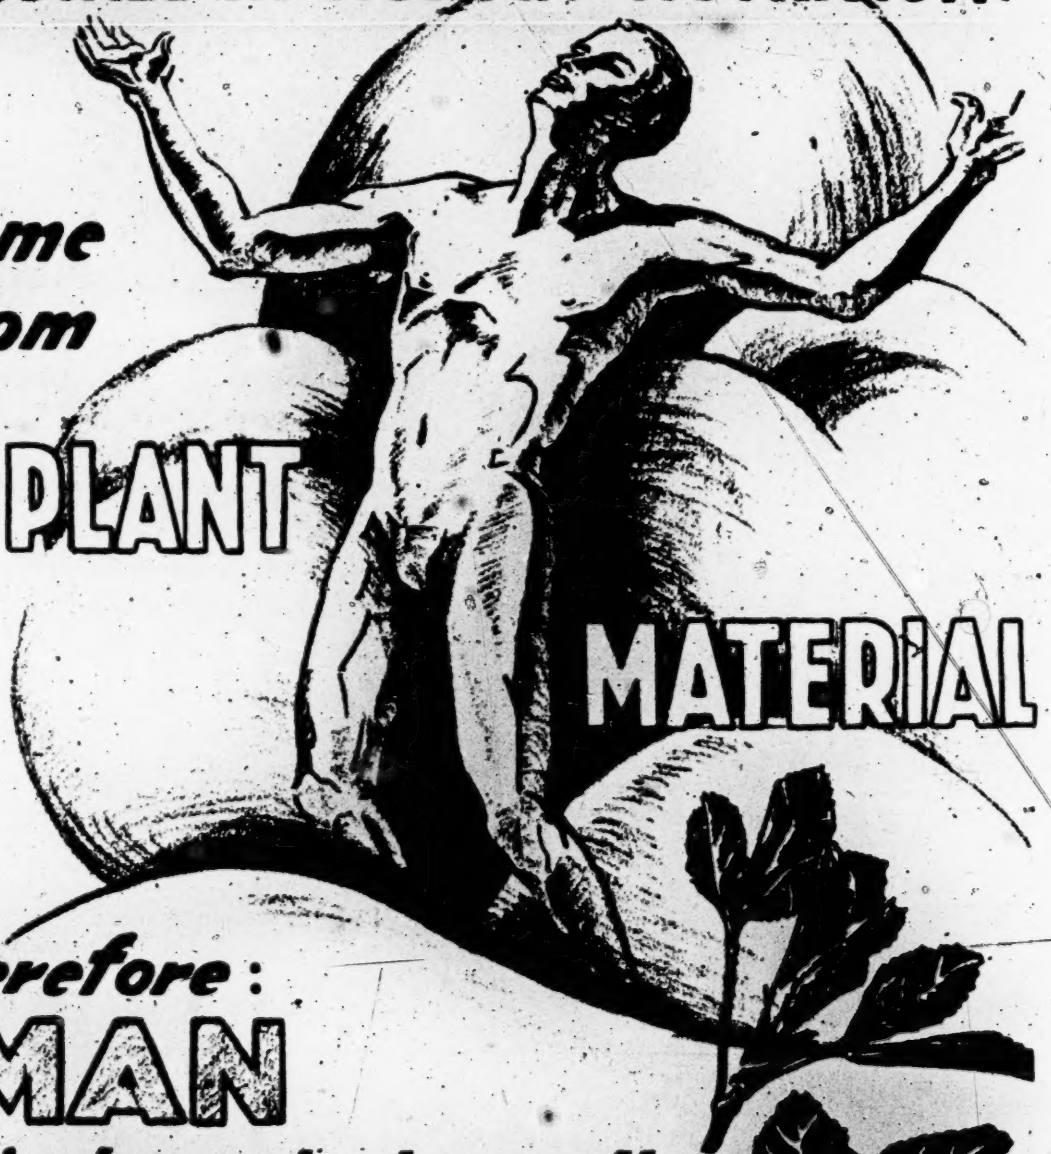
So much of the operation of the body is chemical in nature that Man is often referred to as a chemical machine. How this is possible is partially explained as follows. You can take some cold nitric acid and some cold copper, put the copper in the acid, and soon both the acid and the metal are hot. That is a chemical reaction. And in the same way, when you put cold food into your body, and the body converts it into heat to keep you warm -- that, too, is a chemical reaction. Thousands and thousands of chemical reactions take place in your body every second of every day, and you don't know anything about what is going on.

This is not a fad but the opening of a door to a new way of life and living for all mankind. It has to do with the accessory food factors so small in bulk that although they have always existed in foods they have only recently been recognized.

29
MAN
A CHEMICAL
MACHINE—Whose
Normal Functioning
Is Referred To As
HEALTH

How simply man could have health if he could be placed in a test tube, where his chemical reactions, metabolism, and general aches and pains could be studied. But while he can't be studied that way, modern nutritional science has been intensively studying him for the past forty years.

There are two words doctors use that often confuse us. One is the word metabolism. "Your metabolism is out of balance," they say, or "Your basal metabolism is way too low." Now this word "metabolism" -- what does it mean? Few people know. But the doctor doesn't use the word to confuse you. It's just his scientific way of expressing himself. He refers to the chemical changes in living cells by which the energy is provided for the vital processes and activities, and by which new material is assimilated to repair the waste. If your basal metabolism is low, it means that this chemical process is not very productive of energy and new material.



Another word the doctor uses is "allergy." He will tell you you are allergic. We heard a doctor say recently that almost everything wrong with us was due to some sort of allergy. He means the body has become so sensitive, that a certain something, otherwise harmless, will cause trouble. One little girl we know is allergic to feathers. When feathers are near her she breaks out in a sort of rash. Some people are allergic to pollens of weeds, or flowers. Some are allergic to cats. A doctor told me recently of a man allergic to sunlight. Allergies seem so popular, it's a wonder someone doesn't say he is allergic to his wife, and claim a divorce.

Now it may be perfectly true that your body is sensitive to certain things, and that you really do have an allergy. But this is the big question -- why is your body so sensitive? It isn't enough to know your allergies, and then try to avoid the irritants. The real need is to get your body so adjusted that you won't be so sensitive -- so you won't have the allergies. And here is what the doctors will likely be saying 25 years from now. "There is something wrong with your body chemistry if you have an allergy, and the allergy can be eliminated by your own body, automatically, if you will just give your body all the material it needs to restore its chemical balance."

Your body is a chemical machine, and always the chemical balance must be maintained. When your body gets out of chemical balance, you are ill. When you get into chemical balance and stay there, you are well. That's health in a nut shell, and that's what we find when we put man in a test tube and study him.

Now -- what keeps our body in chemical balance? In other words, what makes us well, and what keeps us well? Here is the story.

all of the factors 31
REQUIRED *in* HUMAN NUTRITION

come from

PLANT MATERIAL

therefore:

MAN

is dependent upon the

PLANT KINGDOM

for **HEALTH**

Once a man had a little calf. It was a cute little brown calf with a white face. The man took the calf out to his pasture -- one of those ideal pastures in a beautiful valley, so all year round the calf could find plenty of food, and water from the stream.

The man left the calf there, with some salt, and took a trip around the world. He was gone a year. When he returned to his calf he found, as we would naturally expect, that it wasn't a calf any more at all -- it was a cow. It was a great big cow, with horns and hooves and a long tail.

As the man stood there by the fence and gazed at his cow, he began to wonder where all the material came from that wasn't there when he left. What made the horns, and the hair on the tail, and the hard material of the hooves?

Obviously, it all came from the grass, since that is all the calf had to eat, with a few leaves, possibly, which it may have nibbled from a young tree.

Now, believe it or not, where the material came from, to make the cow, is important to all of us, for we too grow up in the same way. We too start as a very small animal, and we finish as adults with hair, teeth, bones, finger nails, inner organs and muscles not possessed at first. (Of course, some of us don't have any hair or any teeth when we're grown up, but that's all part of the story too.) As we grow up the hair and teeth grow -- they have to be made of something. Where does the material come from?

You say, it's in the food we eat. It's in all the stuff we put into our bodies -- in the meat, potatoes, milk, bread, candy, coffee, ice cream, pancakes and fruit, vegetables and nuts. Anyway, we hope it is.

It's much like building a house. Suppose you build a brick house, but while it is being built, the bricklayers substitute a lot of wooden boxes, made to look like bricks, for the real bricks. Obviously in an earthquake or big storm, you would lose part of your house. Or a wall might come tumbling down at almost any time. So you call some more bricklayers and they put in a lot more of the imitation bricks along with the good bricks. Everything looks all right, and you think you have done a good job in taking care of your house, but actually your house is still weak, ready to fall apart, and it will stay weak until you get every imitation brick replaced with a good brick.

How many imitation bricks do you suppose you have in your body? It's pretty hard to tell, of course, but here are some facts and figures that will give us an idea of the condition of the bodies of us Americans.

Children die every year in this country from malnutrition. Notice it is not in Europe -- not in Japan -- not in China during a famine -- but

- 918

right here in this country. According to the Bureau of Education, 50 per cent or more of our children in schools need medical attention of some kind. Four million of the boys drafted for army service were rejected for physical defects and inability to serve.

According to a recent study made by a large and well-known eastern college, only one in a thousand is not suffering from deficiency -- from malnutrition. This means that no one can safely say: "I am perfectly healthy and my body is sound and well-nourished."

Think of our population, and think of all the common ailments. Pick up any newspaper and you read of prominent citizens dying in early middle age of the various diseases that claim the lives of so many. Think of the people you know who are ill right now, and suffering, without relief.

This would certainly make it look as though each of us might have a body containing many imitation bricks, so that we look reasonably well, we can get around and do some work, but either we are now experiencing some deficiency disease, or we are ready to come down with one.

If this is the case however, if our diet is so deficient and we have so many imitation bricks in our bodies, how does it happen that we continue to live and get along even in an unsatisfactory manner?

The answer lies in the constant attempt being made by the body to adapt itself to its food.

34

THE HUMAN BODY *adjusts itself to its* FOOD SUPPLY

COMPARE the Sikh—huge, powerful fighting man—and the Madrasi—weak, puny, ailing. Blood brothers of the same ancient race, *nutrition* has made them what they are in the 20th Century. Living cramped in areas where the soil has been devitalized through centuries of cultivation, the Madrasi weighs under 100 pounds and his statistical (average) life span is less than 20 years. But the Sikh, living in the hills, cultivating only virgin soil, grows well over six feet and is proud of his 250 pounds of bone and brawn.

The two men pictured are blood brothers. The difference in size between these two groups -- the Sikh and the Madrasi -- is the result of diet. And right here at home we find that the Japanese reared in the United States are larger, in general, than Japanese reared in Japan. The lack of vital food elements stunts growth, and a full supply of the vital food elements promotes growth.

A good illustration of the effect of food in plant life is the hydrangea. Normally an hydrangea has an orchid-pink bloom. Sometimes you will see one an orchid-pink and another a pale blue. Why? All in diet. There are many pink flamingos in Florida. The flamingos in the zoo in New York were white. For a long time they thought there was a basic difference, until they captured some of the Florida flamingos and took them to New York to the zoo. In a year's time, there was no difference -- just another white flamingo.*

Here is another illustration of what diet does. Diet deficiencies bring on old age. And the diet deficiencies can bring about all the evidences of old age when the person is still in his teens! We are all acquainted with the evidence furnished by the German and Japanese prison camps, as well as the concentration camps for civilians, and we have seen the pictures of the emaciated people. On the extremely deficient prison camp diets, young people showed all the symptoms of old age, and middle aged people died with all the appearances of old age.

We know that diet deficiencies bring on aches and pains. If you don't believe that, just try living on white bread and water for a few months. Further proof, of course, comes from the laboratories where the experiments with rats show the close relationship between diet and health.**

And so we find that, simply through changes in diet, you can change the size of a race of people, change the color of a flower or bird, alter the coat of an animal, bring on premature old age, create a wide variety of aches and pains and illnesses, or bring about death.

*Just as an item of passing interest, we are informed by the curator of a zoo that most zoos have their own secret formula for restoring color to plumage.

**See Hygeia for September, 1947, pp.684ff.

921

FEEDING A CHICKEN HEART

In New York, in the laboratory of the late, great scientist, Alexis Carrell of the Rockefeller Foundation, there was until recently a culture of tissue from the heart of a chicken embryo which lived healthily and grew for over 30 years, many times the life of the chicken which would have resulted if the egg from which the tissue was taken had been permitted to hatch. Fed by fresh serum, regularly renewed and oxygenated by a special device, the tissue grew steadily in its sterile dish. From time to time it was trimmed to limit its growth. In fact, it had to be trimmed, for if it had been permitted to grow unchecked and had been supplied with the required nutrient solution, it would, by the time it finally died, have covered the land area of several states. We have not been told why it did die. Perhaps some accident of infection or failure of nutrient supply. While it grew it was normal tissue, perfect and healthy and potentially immortal.

In the same way every cell of every living body is potentially immortal, provided it receives its full complement of nutrients and there is no invasion of disease organisms.

SUPPOSE IT WERE YOUR BODY

Now, suppose, instead of a bit of chicken heart tissue, consider YOUR OWN BODY. Suppose you become lazy, or grow careless, or you forget, or you don't know, and you supply YOUR BODY with almost all, but NOT QUITE ALL, of its requirements. Then what happens? Slowly, gradually, possibly over a period of years, YOUR BODY wastes away. So imperceptibly does this occur that you do not realize that you are quietly starving yourself.

LIKE TAKING WATER OUT OF A GLASS

Suppose you have a glass of water -- full to the brim. You take out one tenth of a drop a day; and we'll say none evaporates. You look at the glass day after day, and you see no difference because the change from day to day is so small. But after a few weeks you SUDDENLY realize that the water has dropped below the brim.

Just so if you happen to be starving your body for the vitally important but minute quantities of vitamins and other micro-food factors. It goes on so slowly you are not aware of the change until SUDDENLY you realize you are no longer healthy.

ARE YOU STARVING YOUR BODY?

You eat three or more meals every day. You likely eat an inadequate diet, as surveys show to be true for so many people. But most of the time you do not feel any hunger because the quantity of food is adequate. So it never occurs to you that you may be slowly starving your body, condemning yourself to inconvenience and suffering and possibly a shorter life because of substances which are not in your foods, if you are on an inadequate diet, but which you must have. You know there are things wrong with your body -- possibly organic, possibly wrong operation or malfunctioning. But it never occurs to you that these conditions may be due to a dietary deficiency and that they are unnecessary, or that you are doing this to yourself, or that it is the most serious matter of all for you. You don't even know you have left out vital parts of the ideal food formula for your body. Nothing in the taste or looks or smell of your ordinary diet will tell you.

Think about yourself for a minute. Could it be that you are starving yourself -- perhaps dangerously starving yourself?

HOW YOU CAN STARVE IN THE MIDST OF PLENTY

One way to deny your body or organs of your body of certain vital factors of foods is to eat foods grown in soil that has been depleted or exhausted. Obviously, if the raw materials for the ingredients your organs need are not in the soil, the food plants grown in that soil cannot manufacture the things you need and cannot have the ingredients in them. So you can eat the normal amounts of these foods -- or even all you can hold -- and your body will never get all the materials it needs.

Another way to starve your body is to refine the foods you eat, making white sugar from molasses or white flour from wheat, or cutting off and throwing away certain important parts of the plants or fruits you eat. If you refine it out, or cut it off and throw it away, what you need may not be in the food when you eat it, and your inner organs, your teeth, bones, skin, muscles, and nerves may not be properly nourished.

Still another way to starve yourself is to boil the needed elements out when the food is cooked. The part of your food formula that goes down the drain isn't going to nourish your body.

Finally, even if you get most of the needed parts of your food formula into your body, they still may not be absorbed because important factors needed for their assimilation are not present.

Be sure to remember that it isn't just the extreme and well-pronounced deficiency that proves your need for a good food supplement. G. G. Duncan, in Medical Clinics of North America, page 349ff, March, 1946, says, "Clinicians too often have their sights set on anatomical changes as indications of deficiencies. This is a late stage and is the result of prolonged deficiencies."

Early vitamin deficiencies ordinarily do not show themselves as pronounced physical diseases, and consequently, in many cases, it is useless to look for extreme physical changes or definite and diagnosable conditions in the structure of the body in these early stages.

Vitamin and mineral deficiencies show themselves as follows, according to Duncan:

FIRST: indescribable tissue depletion.

SECOND: biochemical lesion detectable by biochemical analysis.

THIRD: and much later, actual lesions and breakdown of the physical structure appear.

This brings us to the consideration of a fact you may have noted already. The healthy individual is not only healthy and full of well-being, but he tends to be free from pronounced psychological disturbances.

Many psychological troubles show themselves in the second stage.

People can have two kinds of psychological troubles. The first type is a matter of bad habits. Examples are: wrong habits of thinking, poor methods of solving problems, habits of introversion, submission, dependence and tantrums, inferiority feelings, procrastination, the habit of rush and hurry, tension, and poor social or business habits. For these the person should have training with a good consulting psychologist or psychiatrist skilled along these lines.

Along with these bad habits, and aggravating the condition, are the so-called "psychological" or "functional" troubles. These stem from the physical condition. We all experience this when we are irritable due to hunger, fatigue or illness.

If you want a "sound mind in a sound body," it is rather obvious that you are going to have to have a sound body. And if you want a sound body, you are going to have to supply your body with the materials it needs for health.

CONCLUSION

It is noteworthy that the babies in China did not improve as they should until the plant extract or concentrate, developed by Mr. Rehnborg, was added to their diet.

This same plant concentrate, when added to the diet of the adult Europeans in the Orient, helped them to better health and made it easier for them to withstand the deteriorating effects of living in China.

In 1933, when NUTRILITE was first sold in the United States, it consisted entirely of the plant concentrate. In preparing this concentrate, plants considered to contain the highest percentage of the micro-food factors required by all animal life, are used. The leaves are harvested and dehydrated. The dried leaves are then subjected to a variety of processes which extract from them important micro-food factors.

This concentrate was added to the diets of many people in California with excellent results.

It was the plan to continue to produce just this concentrate. But at this time the crystalline vitamins were being developed and used with beneficial results, so it was argued that NUTRILITE, good as it was, would be even better if the concentrate had added to it the crystalline vitamins in high potency and in proper proportions. The concentrated vitamins were added, the product was improved, and the present NUTRILITE Food Supplement is the result.

The advantage of the natural concentrate is that it contains the various vitamin complexes, whereas a crystalline vitamin is usually one single factor of the complex. Chemically and nutritionally the crystalline vitamin is the same but it is alone.

Dr. Quigley, famous Omaha dietition, in his book THE NATIONAL MALNUTRITION, says:

"In the selection of a concentrate, it is important to remember, first, that the original deficiency is invariably multiple in origin. The diet has usually been deficient in not one or two, but in many or all of the vitamins. This is being further established every day, in both the research laboratory and in clinical practice.

"It is essential that the concentrate contain all of the vitamins, both known and unknown. Undoubtedly many of the vitamins essential in human nutrition have not as yet been identified or synthetically reproduced. For this reason no synthetic preparation can completely replace the vitamins in which the average persons may be deficient."

In providing NUTRILITE we have attempted to combine the available crystalline vitamins and vitamin concentrates with a plant concentrate to provide in one ration as wide as possible a range of the vitamin and vitamin-like factors concerned in nutrition. Since Dr. Quigley wrote the words quoted above, other hitherto unknown vitamins have, in fact, been discovered and assigned high importance, and no student of the subject doubts that other unknowns -- perhaps many unknowns -- remain to be identified and investigated. Moreover, without exception the vitamins and pro-vitamins originate in the leaves of plants, and plants are the source one must look to for such a concentrate as we use.

The sufferer with dietary deficiencies and deficiency ailments has the problem of getting into his body all the basic food factors which either were never in his food to start with or which have been partially removed in some way. If you are such a sufferer, how can these basic food factors be added to your food? We believe that NUTRILITE Food Supplement is at least one answer.

The man, woman or child who is reasonably well, and who wishes to stay that way and if possible improve, has also the problem of keeping his body supplied with all the vital food factors. If you are in this group you too have a problem, in this civilized age of devitalized and imitation food. And here again, you can turn to -- NUTRILITE Food Supplement.

EPILOGUE

In preparing this book for your reading, our primary purpose is to cause you to realize that the average or better than average civilized diet does not always provide you with complete and adequate nourishment. We define a "civilized diet" as the usual diet of civilized man -- one which includes so-called "food" made of white flour products, pasteurized milk, polished rice, refined sugar and including vegetables and fruits which are grown in partially depleted soil, then shipped, stored and cooked or canned in such a way as to lose vital elements. The civilized diet also includes meat from animals fed grass or hay and grain grown in depleted or partially depleted soil, the meat then being stored, and finally cooked in such a way as to lose some of its important but easily destroyed food factors.

We believe the statements made in this book to be facts, and we have tried, in this book, to stick to facts.

Common sense would then suggest that, if you want to have your diet include all needed factors, you will have to do one or the other of two things -- either (1) find and eat food which contains all the items which are found in unrefined, unprocessed, fresh, uncooked plants, grains, vegetables and fruits grown in the equivalent of virgin soil, and meat from animals which have been fed on such grass, hay and grain, and which meat in turn is so handled and prepared as to preserve its vital food factors;

or (2) add to your present civilized diet those factors which either have been removed from your food, or which never were in it in the first place. The former is expensive and time consuming. The latter method is less expensive and saves valuable time. So in this book we recommend the latter method, whether you use our particular product or not.

In our effort to convey the facts and our recommendations to you, however, we are forced to use words, and to combine them into sentences. And these words and sentences, as we explained at first, may not always convey to you the exact meaning intended. With your indulgence, therefore, we would like to check up a bit.

1. After reading this book, what are your conclusions concerning the average American diet? Do you consider it entirely adequate? Or do you conclude that our civilized diet is inadequate?

Various surveys give conflicting reports as to the extent of deficiencies in the American diet, but all the surveys we have seen show that there is an astonishing proportion of people, living on what is considered the standard American diet, who are deficient in one or more of the vital food factors.

2. On page 16, where we tell about the vitamins, we say, "Vitamin A raises the body's resistance to infections, etc." When you read this do you conclude that always, in every case, no matter how much Vitamin A is now being included in a person's diet, the addition of Vitamin A will increase that individual's resistance to infections? If so, this is a mistake. In order for Vitamin A to be effective in raising a body's resistance to disease, obviously the body must be deficient in Vitamin A at the time. If we said, "Gas, exploding in the cylinders, makes the automobile engine run," would you think we meant that any gallon of gas would make any car engine run? This would be wrong, for you might have an automobile with the tank absolutely full of gas. Then a gallon of gas in a can by the car could not affect that engine at that time, since the additional gallon, poured into the tank would simply run over onto the ground. Naturally, if a body already contains sufficient Vitamin A, an additional amount of the vitamin will not contribute to the body's ability to resist infections.

You see what we mean when we say it is difficult to write in such a way that absolutely no wrong interpretation can be placed on a statement?

3. On page 28, paragraph three, we state that "We should live in good health and vigor to the age of 90 or 100." Authorities like McCollum and Sherman rather agree that the life span of man can be extended possibly ten years, by proper food. What do you think?

We still think that really adequate nourishment of the mother for a year or so before the baby is born, and then the completely adequate nourishment of the child all its life, should result in a good chance to reach the age of 90 or 100, assuming normal heredity, no accidents, and proper observance of other health rules such as exercise, rest and proper breathing.

4. When you read this book do you conclude that because NUTRILITE Food Supplement provides your body with material that may be needed due to previous deficiencies, for rebuilding and regulating, that all medication would have to stop when NUTRILITE is added to your diet? If so, you are wrong. Just as you would continue to take any needed medicine even if you added beefsteak or whole wheat bread to your diet, so you continue the use of any needed medicine when you add NUTRILITE Food Supplement to your diet.

When you begin the use of any food supplement, be sure to consider also if there is any possibility that you need the services of a physician. If there is any evidence that a doctor should be consulted, you should do so. Bear in mind that in the use of any food supplement you are only improving your nutritional status. You may have other conditions that require the services of a physician, in which event you should consult a doctor immediately. It is a sound health rule to see your dentist twice a year and to have a regular periodic check-up by your physician.

This book is not a necessity in our work. But it is a help to the thousands of interested people, our customers as well as our Distributors, in all parts of continental United States and in Hawaii, Alaska, Panama Canal Zone and the Philippine Islands, who are enthusiastically telling other people about the benefits derived from food supplementation. It proves helpful because it saves their time, and it enables a person to learn about diet, nutrition and food supplementation in the quiet of his own home, and at his leisure.

FOOD AND DRUG ADMIN.

Rm. 201 Federal Office Bldg. MP

Mytinger and Casselberry of Long Beach, California, distributes Nutrilite, a dietary supplement, distribution through agents making door to door and club appearances. The firm has several pieces of literature used by agents and loaned to customers, principally booklet entitled "How to Get Well and Stay Well." Recent seizure and grand jury indictment has let firm to delete pages 37 through 58 from booklet and to caution agents with respect to our activities. Firm shipper yesterday to the F and M Bank Clarkfield Minnesota via rea seven cartons Nutrilite, weight 196 pounds, value $2600.00, said to be due for delivery at destination Friday. No known literature accompanied shipment. An investigation should be undertaken prior to delivery this shipment to determine scope and character of representations made orally, and by accompanying literature, by the dealers. If consignment is to be used to fill orders from regular customers who have contracted for monthly deliveries, a representative number of these users should be contacted for their understanding of the value of the product. If broad representations continue to be made, booklet pages one through 37 intact, or other collateral material which misbrands the product employed, complete facts should be reported immediately for seizure consideration.

1865 MEMORANDUM TO ACCOMPANY 25560K NUTRILITE

Investigation preceeding the collection of this sample was started on November 19, 1948 but as there was a terrific snow storm at that time I was unable to complete the investigation which was requested to be made before sample collection. Attached is the preliminary report that was made.

On November 30, 1948 the investigation was completed and the sample was collected. Mr. Quale at present has 19 customers. Two of these who live in Clarkfield were interviewed first and these two people signed affidavits, the originals are with the records and copies are attached to all copies of this memo. Five farmers were interviewed on 12/1/48 before I collected the sample and these interviews were written up as interviews instead of affidavits. I did not take affidavits from these five as farmers are reluctant to

sign affidavits and their testimony was about the same as the two town folk although probably not as strong.

All people I talked to including Mr. Quale, the distributor, were very friendly and co-operative. None of them thought that Nutrilite was a cure for anything but merely vitamins and minerals which would build their bodies up. None of these people were the rabid health addicts that one so often comes into contact with in an investigation of this type.

The Farmers and Merchants State Bank finances each shipment for Mr. Quale and this is covered in my report of 11/19/48. The stock of Nutrilite will probably be in the bank for a month or two. On the invoice are 6 bottles of vitamins B_1 and E, Mr. Quale said that these are for his own use and these were not sampled. The books "National Malnutrition" shown on the invoice of 5/7/48 are covered in Mr. Quales affidavit. Also note that the firm has sent out new pages 37 through 42.

Nutrilite was not "knocked" to any of the people interviewed or to Mr. Quale. These people were merely told that we investigate drugs to see what results the users have obtained and that was what this investigation was.

The sample has been split. One kit is being sent to Vitamin Division with the original records and the booklet "How To Get Well And Stay Well". One kit is being sent to Los Angeles Station for mineral analysis and copies of all the interviews, report, memo etc., are being sent to the Administration. Copies of everything except the records are also being sent to Los Angeles.

None of the people interviewed said that they had received any other literature from Mr. Quale other the booklet "How to Get Well & Stay Well". Mr. Quale said that the only instructions for his sales talk that he had received from the Company was to be careful what he said, not to promise any cures and to say only what is in the booklet "How To Get Well & Stay Well."

MEMORANDUM OF INTERVIEW

Between

Mrs. Oscar (Anna) West
Rural Clarkfield, Minnesota

and

James E. Anderson
Inspector

Mrs. West was interviewed in connection with the collection of 25-560 K, Nutrilite. The reason for the interview was to find out how the dietary preparation was presented to her, and her understanding of the composition and value of the product.

Mrs. West lives on a farm 5 miles south and 1¼ miles east of Clarkfield. She is approximately 30 years old. Mrs. West said that she has been suffering from arthritis and anemia. She had been treated by local doctors and part of the treatment consisted of vitamin tablets. She believed these helped her a little but hardly enough to make much difference in her condition. About 6 months ago, from her neighbor Oscar Sandager, she heard about Nutrilite which had helped Mr. Sandager's arthritis. She told Mr. Sandager to have Mr. E. A. Quale, the Nutrilite distributor, come out and see her.

Mr. Quale came to see Mrs. West about 4 or 5 months ago. He told her how Nutrilite had helped Mr. Sandager and about other people with arthritis who had used Nutrilite and had obtained relief. He told her that the preparation wouldn't cure her arthritis, but he thought it would help her arthritis and cut down her anemia by building up the body and blood through the vitamins and minerals which are in Nutrilite.

Mrs. West said that she is now on her fourth month of taking Nutrilite; in other words, she is on her fourth bottle. She said that at the time she signed up for the course Mr. Quale gave her the booklet, "How To Get Well and Stay Well" and she had read this booklet and given it back to him. When she started using the Nutrilite she did not think that she was getting a cure; in fact, she and her husband were both skeptical of the product, but from her treatment under the local doctor she knew that she needed vitamins and so wanted to give Nutrilite a chance.

Before taking Nutrilite Mrs. West had to take liver shots; after taking Nutrilite for a month she did not have to take any

more liver shots. Right now she believes her arthritis is gone in that she does not have any pains or stiffness. She is gaining weight, and is not as tired as she use to be which leads her to believe that her anemic condition is cleared up.

1867 I asked Mrs. West if she thought that Nutrilite was a cure all or something wonderful, and she said that she believes it had helped her very much but does not know if it will cure anything. It would appear that Mr. Quale did not make any wild claims to Mrs. West and that she was not led to believe that the product was anything more than vitamins and minerals which would help to build her body up.

MEMORANDUM OF INTERVIEW

Between

Mr. Oscar Sandager
Rural Hazel Run, Minnesota

and

James E. Anderson
Inspector

This interview was made as a part of the collection of 25-560 K, Nutrilite, to try to determine how the salesman, Mr. E. A. Quale, represented the dietary supplement and what idea the buyer, Mr. Sandager, had of its value.

Mr. Sandager lives 5 miles south and 1¾ miles east of Clarkfield, Minnesota. He lives with his mother and his sister, Gladys, on a farm. He is 59 years old.

Mr. Sandager said that he has had arthritis for several years and was under the treatment of Dr. Houghton in Clarkfield, Minnesota. He was given many different treatments by the doctor, and the last one consisted of shots of strep—, the name of which Mr. Sandager could not remember. About this time, which was in 1947, Mr. Sandager heard from his hired man that the hired man's sister had had arthritis and was not expected to live as her weight kept going down and she was gradually failing. She started to take Nutrilite and regained her health and is still living.

Mr. Quale, in 1947, had either been told of Mr. Sandager's condition or heard about it and came out to see him. Mr. Quale said, "I won't say this will cure or help your arthritis but I think it will". Mr. Quale then told Mr. Sandager of other people with arthritis who had been helped by Nutrilite. Mr. Sandager was given the booklet, "How To Get Well and Stay Well". He said he never read the booklet, just looked at the pictures and then returned it to Mr. Quale. Mr. Sandager said he told Mr. Quale he did not think he would use the Nutrilite and kept on taking shots from his doctor. His condition kept getting worse and finally he could hardly walk and was thinking of selling his equipment and quitting farming due to his arthritis. The doctor told him the only thing left that he knew of was gold shots, but he did not seem very sure about gold shots so Mr. Sandager did not take them. He then switched over to Nutrilite in September, 1947 and has been taking it regularly ever since. His idea of Nutrilite at the start of his treatment was that it contained vitamins and minerals to build him up. He said he was a skeptic in the beginning and did not think it would cure anything, but he had so many medicines and injections that he was ready to try anything. He said that at no time did Mr. Quale say it would cure his arthritis, and he was never led to believe that. At present he does
1869 all his own farming, walks without a limp or without any slowness in his gait, and says he is in good health. He does not believe his arthritis is cured for when his feet get wet he can feel a slight pain in his extremities. He is now on his second year of taking the Nutrilite and does not know whether to continue on or not; he is afraid that if he stops taking Nutrilite his pains and arthritic condition will return.

Mr. Sandager's sister, Gladys, is also a user of Nutrilite. She started using it after Mr. Sandager. He said that he was the reason for Gladys' taking it because he was so enthusiastic about it. She was suffering from headaches and upset stomach. At present he said his sister has pains but they are not so often or hard.

Mr. Sandager's mother is quite old and has had two strokes and is run down. He talked her into taking Nutrilite although she is still under doctors care. He believes the Nutrilite has helped her in that she is stronger now. Mr. Sandager said that Mr. Quale had not told either of these women the Nutrilite would cure anything they had and that Mr. Quale was not as enthusiastic about Nutrilite as he himself was.

MEMORANDUM OF INTERVIEW

Between

Mr. Olaus Nyland
Rural Hazel Run, Minnesota

and

James E. Anderson
Inspector

This interview was made as a part of the collection of 25-560 K, Nutrilite, and to try to determine how the salesman, Mr. E. A. Quale, represented the dietary supplement and what idea the buyer, Mr. Nyland, had of its value.

Mr. Nyland is a farmer living about 2 miles outside of Hazel Run, Minnesota and is, I would judge, in his late 50's or early 60's.

Mr. Nyland said that for a long time he had had rheumatism all over his body and when I said arthritis, he said, "Yes, it's arthritis". From Mr. Oscar Sandager, Mr. Nyland heard about Nutrilite and how it had helped Mr. Sandager. Mr. Nyland then went to Mr. Quale's office in Clarkfield, Minnesota and told Mr. Quale that he had arthritis and was interested in Nutrilite. Mr. Quale gave Mr. Nyland the booklet, "How To Get Well and Stay Well". Mr. Quale did not give him any sales talk, just referred him to the book and told him of other customers who had used Nutrilite and had obtained relief from their arthritis. Mr. Quale told him that Nutrilite would not cure arthritis, but he believed it would help him. Mr. Nyland read the booklet and then returned it to Mr. Quale.

Mr. Nyland said that he believes Nutrilite is a vitamin and mineral preparation which he is taking to build up his body. He is hoping that the vitamins and minerals in it will build up his body and so overcome his arthritis. He does not believe that Nutrilite is a cure but thought that he would try it for at least the prescribed year and see what it would do for him. He has taken Nutrilite regularly for 5 months now. He is not as stiff as before and the arthritic pains are a little less than when he started taking Nutrilite. However, he volunteered that at this time of year he does not work as hard as in the summer and this may be the reason the pains have decreased.

MEMORANDUM OF INTERVIEW

Between

Mrs. Alfred (Louise) Hegrin
Rural Clarkfield, Minnesota

and

James E. Anderson
Inspector

This interview as made as a part of the collection of 25-560 K, Nutrilite, and to try to determine how the salesman, Mr. E. A. Quale, represented the dietary supplement and what idea the buyer, Mrs. Hegrin, had of its value.

Mrs. Hegrin is 56 years old and is a farmers wife living 5 miles south and 1½ miles east of Clarkfield, Minnesota. She said that when she was 23 years old she had an appendectomy, pneumonia, rheumatism and inflamed heart sack. She had a hard time recovering from these afflictions and was anemic and felt run down. Then 6 years ago she had her gall bladder removed. She was anemic and felt run down and was given iron. She gained some weight and felt a little better. She was still not satisfied with her physical condition, feeling that she was still run down and susceptible to colds and other contagious diseases. Her neighbor, Mr. Oscar Sandager, told her about Nutrilite and how it had helped his arthritis. She told him to send Mr. Quale, the Nutrilite distributor, out to see her.

Mr. Quale came out to see Mrs. Hegrin and she told him that she was run down. Mr. Quale told her that she should try Nutrilite and see if it would build her up. He said it would not cure anything and that Nutrilite had helped some people and had not helped others. She did not order any Nutrilite at this time. Mr. Quale left her the booklet, "How To Get Well and Stay Well". Right afterwards she caught a cold or had the flu, she did not know which but thought it was the latter, and had to stay in bed. While in bed she read the booklet and decided to try Nutrilite. She has an open mind on Nutrilite and does not know whether it is good or bad, but she has to take some vitamins, the doctor had prescribed vitamins for her, and so is taking Nutrilite believing that it contains vitamins and minerals which she needs and which she hopes will build her up so that her body will be more resistant to disease (disease means colds, flu, etc.). She is just finishing her fourth month, her fourth bottle of Nutrilite, and believes she has more pep now and feels better. She

also believes her blood is up but has not had it tested recently and so could not be sure.

JAMES E. ANDERSON,
Inspector.

25-560 K
Nutrilite — Mytinger & Casselberry
Long Beach, California

MEMORANDUM OF INTERVIEW

Between

Mr. Leonard Vold
Rural Hazel Run, Minnesota

and

James E. Anderson
Inspector

This interview was made as a part of the collection of 25-560 K, Nutrilite, to try to determine how the salesman, Mr. E. A. Quale represented the dietary supplement and what idea the buyer, Mr. Vold, had of its value.

Mr. Vold is a farmer living outside of Hazel Run, Minnesota. I would judge he is in his late 30's. Mr. Vold was not at his home and so I talked to his wife and she gave me some information. Then I found Mr. Vold on another farm cutting wood and he gave me the rest of the information.

Mrs. Vold said that her husband has had ulcers for years and goes to sleep when driving or sitting in a chair. Last September he had all his teeth out but the removal did not seem to help his condition too much. From Mr. Oscar Sandager, Mr. Vold heard about Nutrilite. He did not make any special inquiry about it, but one day when Mr. E. A. Quale, the Nutrilite distributor, was out selling him hog minerals Mr. Vold mentioned that he was going to sleep at odd times and asked Mr. Quale if Nutrilite would help him. At this point Mrs. Vold said I had better talk to her husband and she located him for me on an adjoining farm where I went and interviewed him.

Mr. Vold said that in 1939 his ulcer had ruptured and he had come to Minneapolis where he had it sewn up. The ulcer is still active, and in the spring and fall and other times he suffers attacks. The main thing which worries him is that when he is driving or sitting in a chair he falls asleep. He believes this may be due to blood loss from his ulcer although he says he does not think he is anemic.

When Mr. Quale came out to see him Mr. Vold believed that he knew he had ulcers but he was not sure of it. He told Mr. Quale that he wanted something which would make it so that he would not always fall asleep. Mr. Quale told him that Nutrilite would help build him up and thus would help him stay awake if this drowsiness was due to poor blood or loss of blood. The Nutrilite was not represented as an ulcer medicine and was not being taken as such. Mr. Quale told Mr. Vold that it would take 6 months before he would notice any results. Mr. Vold thought that Nutrilite contained vitamins and minerals which would help build up his body. He did not think it was a cure, but rather thought it was another medicine he would take to see if it would work. He has taken Nutrilite for 2 months and has not noticed any results yet.

FACTS

you should know about

Vitamins

Safeguard War-Time Savings!

BETTER BUSINESS BUREAU
FACT FINDING AND DISTRIBUTING
EDUCATIONAL DIVISION

Vitamins are measured in milligrams or micrograms (measures of weight); or in "International Units," "U.S.P." units, which are defined in terms of pure substance, or "Sherman" units which are biological units. So that one may understand vitamin measurements as expressed in these various units and to enable a better understanding of labels, the following information is provided:

MG	means milligram
G or Y or Gamma	means microgram
I. U.	means International Unit
U. S. P.	means United States Pharmacopeia

COMPARISON TABLE

1 (avoirdupois) ounce = 28.350 grams (metric system)

1 gram = approx. 1 30th of an ounce

1 milligram = 1/1000 of a gram

1 microgram = 1/1000 of a milligram

CONVERSION EQUIVALENTS

(approximate)

Vitamin A	1.5 I.U. = 1 Sherman unit or Sherman units x .7 = International Units 1 U.S.P. unit = 1 I.U.
Vitamin B_1 (Thiamin)	1 Milligram equals 333 International Units (1 microgram equals .333 International Unit).
Vitamin B_2 (G, Riboflavin)	Sherman units x 3 approximates equivalent in micrograms.
Vitamin C (Ascorbic Acid)	1 Milligram equals 20 International units.
Vitamin D	1 U.S.P. unit presumably has the same value as 1 International Unit.

INTRODUCTION

This booklet, "Facts You Should Know about Vitamins," is one of a series of fact booklets on business, merchandise, financial, and other subjects which business, through Better Business Bureaus, is publishing in the interests of consumer education — to aid consumers in their everyday money management problems and relations with business.

The importance of proper nutrition was recognized by our government in calling the first National Nutrition Conference at Washington in May, 1941. At this conference, the need for an aggressive attack upon the problem of undernourishment in this country was brought out repeatedly. According to an official report of the Conference:

"Something more than 40 per cent of the American people are not getting enough food and the right kind of food to maintain health and vigor — and this in spite of the fact that the foods of which we have a so-called surplus are the very ones they need. Less than one-fourth are getting a really good diet, even when measured by lower standards than those to which we would subscribe today. If everyone could have an adequate diet instead of an average diet, it would add 10 years to our active life span."

At the same conference, Brig. Gen. Lewis B. Hershey, Deputy Director, Selective Service System, stated:

"In summary, Selective Service has examined physically a million. The results of these examinations should be disturbing to us as a people — they should energize us to immediate and positive action. Approximately 400,000 have been found unfit for general military service — probably one-third of these are suffering from disabilities directly or indirectly connected with nutrition."

It is now being recognized that it is important that all workers and the civilian population as a whole should be properly nourished.

Vitamins are essential food elements which must be present in the diet in adequate amounts for health and well-being. Scientific and medical knowledge of vitamins is growing day by day, but this booklet undertakes to explain, in layman's language, some of the fundamentals as to what vitamins are, what values they possess, and where they may be obtained, although no pretense is made of giving all details or a complete list of food sources of the vitamins.

WHAT ARE VITAMINS?

"Vitamin" is a term given to certain food constituents which are essential for normal nutrition. They are but one of several dietary essentials. Most of us know, for example, that the diet must contain, in adequate quantities and proper balance, proteins, carbohydrates and fats which yield the energy and other requisites for life and activity and which, along with certain inorganic elements such as iodine, iron, calcium and phosphorus, form the structure of the body tissues and the fluids of the organism. In addition to these more familiar nutrients, there are other food factors essential for the preservation of bodily well-being which we commonly designate as vitamins. The absence or serious deficiency of any one of these nutrients, including any of the vitamins, from a diet which is satisfactory in other respects may lead to the development of pathological conditions which are called "deficiency diseases," which may be even more striking in appearance and effect than failure to get enough food.

Scientists have succeeded in isolating a number of compounds having the properties of vitamins, determined their chemical formula and have learned how to produce some of them synthetically. You can see these chemical compounds, feel them, weigh them. In fact, nutrition charts which recommend specified daily amounts of certain vitamins often do so in terms of milligrams or micrograms — measures of weight. (A microgram is one millionth of a gram.) Other nutrition charts express vitamin values in terms of International Units, U.S.P. Units and Sherman-Bourquin Units. (There are certain elements in Vitamin A, for example, which cannot be weighed.)

No vitamin diet charts are given in this booklet because vitamin values of foods differ according to growing conditions such as soil, climate, etc. Another reason is that vitamin requirements vary according to the age, size, activity and health of the individual. However, literature on daily allowances of vitamins and other nutrients, planning meals and diets, and other food subjects, may be secured from the Bureau of Home Economics, U.S.D.A.; Children's Bureau, Dept. of Labor; and Nutrition Division, Federal Security Agency, all at Washington, D. C.; or from many local or state Health Departments.

SOURCES OF VITAMINS

Vitamins are present in a great variety of food products, in varying quantities. There is no reason why a properly selected diet should not afford an adequate supply of the requisite vitamins. Yet it is believed that a great many people fail to get enough vitamins not, primarily, because we do not get enough food but because we do not eat enough of the right kinds of food. Many of us do not get an adequate diet. Most of us get enough vitamins to prevent specific deficiency diseases, but

many people who do not develop acute or recognizable symptoms of disease nevertheless fail to secure the full amount of vitamins consistent with ideal physical well-being. This is particularly true of people who go in for "one-sided" diets such as ill-advised reducing diets and fads of various kinds, and people who eat too much of certain groups of food to the exclusion of others. In many cases deficiency conditions may be properly corrected by the use of appropriate foods or, a corrective result may be effectively and speedily secured by the administration of various vitamins in concentrated form or products especially rich in them.

VITAMINS NOT CURE-ALLS

It must be emphasized that vitamins should not be regarded as an indiscriminate means of treating deficiency disease conditions but, rather, as an indispensable aid in maintaining normal health. While physicians do employ vitamins in the treatment of various diseases, vitamins are generally used as an adjunct to more complete measures. Although a deficiency of vitamins does cause certain deficiency diseases, some disease symptoms similar in nature may be caused by other factors which would not respond to vitamin treatment. For these reasons, treatment of deficiency disease conditions with vitamins should be left to qualified physicians. However, all of us can endeavor to prevent the appearance of ailments due to vitamin deficiency by obtaining an adequate supply of these essential elements in the daily diet. While an adequate supply of vitamins will not, in itself, assure good health or prevent all dietary deficiencies or deficiency disease conditions, the vitamins do have a vital effect on practically every organ in the body and deficiencies of them are related to a score of diseases and deformities.

Medical scientists are still studying the effects and usefulness of vitamins and any peculiar or allergic effects which vitamin supplements might have on certain persons.

There are limitations on present medical and scientific knowledge of the usefulness of vitamins in the treatment of disease. For this reason alone, one should not attempt to be his own doctor by trying to treat a disease condition by vitamins.

VITAMIN NOMENCLATURE

That there are more vitamins than was originally believed is definite. What remains to be determined is how many. Many of the known vitamins have been given alphabetical names for convenience, such as Vitamin A, B_1, B_2(G), C, D, etc. From a scientific standpoint, the most practical way of naming vitamins is to give each one its chemical name, where known, but because the public as a whole still recognizes vitamins by their alphabetical designation, both chemical and alphabetical names are given in this booklet.

VITAMIN A

Vitamin A is essential for the maintenance of a healthy condition of the epithelial cells which cover body surfaces and line the body cavities such as the mouth, stomach, glands, and ducts of glands. When there is a deficiency of vitamin A, dryness and scaliness of the skin is likely to appear. It also has important functions with respect to the eyes. One of the first symptoms of vitamin A deficiency is the condition known as night-blindness. The vitamin will prevent or relieve this condition, if it is not too far advanced, when due to vitamin A deficiency. In fact, the physicians of ancient Egypt are credited with curing thousands of cases of night-blindness with liver, a rich source of vitamin A. However, there are other cases of "night-blindness" not of dietary origin, which do not respond to treatment with vitamin A. Another characteristic eye disease called xerophthalmia also results from a more advanced deficiency of vitamin A.

Vitamin A is also highly important for normal growth and for proper tooth and bone formation in growing children, although the same can be said of other food essentials. In addition, its insufficiency in the diet may lessen the resistance of the body to infection, especially of the respiratory tract. However, vitamin A has not been definitely shown to be a preventive of specific infections, such as colds or influenza.

Vitamin A is found in the liver and yellow body fat of most animals. In addition, various plant foods contain what are known as "precursors" of vitamin A. These are yellow pigments called "carotenes" which, when consumed, are transformed into vitamin A. This is the only known vitamin which is "manufactured" by the human body from plant food. Vitamin A can be stored in the liver by man and other animals. Cod and other fish liver oils are excellent; and liver, butter, cheese, eggs and milk are good sources of vitamin A. Green and green leafy vegetables, such as green beans, beet tops, dandelion greens, spinach, swiss chard, kale, etc., tomatoes, and bright yellow fruits and vegetables, such as apricots, peaches, persimmons, carrots, yellow corn, sweet potatoes, winter squash, etc. are good sources of vitamin A precursors.

THE VITAMIN B COMPLEX

What was originally called vitamin B and was thought to be a single substance, has since been found to be a group of several substances and to this group is applied the term "vitamin B complex." While the exact number of the constituents of the Vitamin B complex is not known at present, the chemical nature of several has been determined and they can be produced synthetically. Of them, at least three have been shown to be necessary in human nutrition and to be of value in the prevention and treatment of human deficiency diseases. They are Vitamin B_1, or thiamin, Vitamin B_2, or riboflavin, and nicotinic acid.

All of these substances are usually found together in a single food product, such as yeast or liver. For the purpose of this booklet it is not deemed necessary to give detailed information on all the Vitamin B factors because scientific conclusions are still incomplete.

VITAMIN B_1 (THIAMIN)

One of the first facts to be established about vitamin B_1 was that, in the presence of a severe deficiency, a disease called beriberi made its appearance. This is a disease characterized by partial paralysis, swelling of the legs and general dropsy. Vitamin B_1 is of value in preventing as well as correcting certain forms of this disease. It is of value in the treatment of certain types of neuritis, but it should be employed in the treatment of such conditions under the direction of a physician. There are many types of neuritis not due to a deficiency of vitamin B_1, requiring other forms of treatment.

When the diet is deficient in vitamin B_1, lack of appetite occurs, but there are many other causes of lack of appetite, such as infections, organic disorders, etc. However, vitamin B_1 does contribute to and is necessary for the maintenance of normal appetite.

When their diet is deficient in vitamin B_1, the rate of growth of infants and children is retarded. Some investigators believe that lack of the vitamin plays a part in faulty elimination. When metabolism is increased, as occurs in feverish conditions, vigorous muscular activity, hyperthyroidism, etc., there are indications of greatly increased requirements for vitamin B_1.

Although vitamin B_1 is widely distributed, it occurs in high concentration in only a few foods. There are grounds for believing that American diets as a whole have been unsatisfactory with respect to the content of vitamin B_1. Yeast and wheat germ are the richest natural sources, but they are not commonly used as foods. However, whole grain cereals and flours, and the products made from them, are excellent sources as are such meats as pork, fresh ham and liver, and soy beans, green peas, nuts, egg yolk and lima beans. In the past, the refinement of various foods, has been responsible for a deficiency of vitamin B_1 in the diet of many individuals, but this difficulty is being overcome through the enrichment of such foods. (See section on "Fortified" Foods.)

VITAMIN B_2 (G) (RIBOFLAVIN)

After vitamin B_1 was discovered, the term vitamin B_2, or vitamin G, was used to designate what was left of the vitamin B complex. It was first believed that this vitamin was a single substance which was of value in the treatment of pellagra and it was popularly designated as the anti-pellagra vitamin. Later, vitamin B_2 (or G) was identified as riboflavin, a single chemical substance, and it was determined that

another constituent of the vitamin B complex, nicotinic acid, was the pellagra-preventive factor.

Vitamin B_2 or riboflavin has a wide distribution in living cells and is essential for normal nutrition. Among other things, deficiency of riboflavin is reported to result in the formation of various lesions around the corners of the mouth, on the tongue and ears, etc.

Riboflavin is widely distributed. Yeast, meats, particularly the liver of beef, calf, lamb, mutton and pork are excellent sources. Whole cereals, milk, eggs, cheese and many green leafy and other vegetables, such as beans and peas, fruits, peanuts, and fish such as halibut, haddock, canned sardines and, particularly, mackerel, are all important sources.

NICOTINIC ACID

The pellagra-preventive factor of the vitamin B complex has been identified as nicotinic acid, a substance which, incidentally, is not the same as the nicotine found in tobacco. Seemingly miraculous results have been obtained with nicotinic acid in the treatment of acute pellagra, a disease which has occurred widely in the South and is characterized by leathery, reddish skin, mouth and gum inflammation and progressively more serious symptoms including, in advanced cases, alimentary and mental disorders. Pellagra can be prevented by securing an adequate supply of nicotinic acid in the diet and is often cured quickly, by physicians, who inject nicotinic acid into the body. However, since most deficiencies are of a multiple nature, a diet rich in vitamin B_1, B_2 and B_6 is also frequently necessary in the treatment of this disease. Liver, lean meats, salmon, yeast, green vegetables, whole grains, tomato juice, eggs and milk are believed to be good food sources of nicotinic acid.

VITAMIN C (ASCORBIC ACID)

Vitamin C is another of the vitamins which can be produced synthetically in pure chemical form. It is officially known as ascorbic acid.

A deficiency of vitamin C results in the development of scurvy, a disease the notable symptoms of which are pain and a tendency to bleeding, as of the gums and capillary blood vessels. This disease may be avoided or entirely cured by the inclusion in the diet of foods which are rich in vitamin C. The term "limey," applied to British sailors, was derived from the Merchants Shipping Act of 1854 which provided that lime or lemon juice form a part of the stores of all ships likely to be away from port more than ten days. The juice of citrus fruits is a rich source of vitamin C.

Vitamin C is also one among other essential factors for the normal development and the maintenance of the bones and cartilages, the teeth and gums. Such symptomatic conditions as dental caries

(cavities), lack of appetite, certain gum infections, and anemia may be concomitant signs of vitamin C deficiency or lack of assimilation of vitamin C.

Vitamin C is wide-spread in practically all raw fruits and vegetables, particularly citrus fruits such as oranges, grapefruit and lemons. Properly canned fruits and vegetables, including fruit juices, retain a large share of their vitamin C, and may be an important source of this factor in the diet. The green leaves and shoots of plants such as are served in salads; such fresh fruits as apples, apricots, bananas, black currants, red raspberries, and strawberries; and many raw vegetables including brussels sprouts, cabbage, cauliflower and fresh-picked green peppers also generally supply a liberal portion of this vitamin. Potatoes, when baked or boiled in skins, are another important source, particularly in view of the extent to which potatoes figure in the average diet. It is necessary that adequate amounts of this vitamin be secured daily since it is stored in the body only to a limited extent and a deficiency may result in injurious effects. In fever, the needs of the body for vitamin C are increased.

VITAMIN D

Vitamin D is necessary for the proper utilization by the body of calcium and phosphorus. It is related to the development of bone and a deficiency causes rickets, a common disease of childhood, in which deformed bones manifest themselves as bow legs, knock-knees, swollen joints, distorted chests and spines, etc. A deficiency may also result in two other fearsomely named diseases, spasmophilia and osteomalacea. All of these conditions are manifestations of abnormal calcium and phosphorus metabolism which may result from a deficiency of vitamin D. The vitamin is essential not only in the prevention but in the treatment of these diseases.

Vitamin D plays an important role in tooth formation and maintenance of normal tooth structure. However, adequate vitamin D intake will not, in itself, prevent dental caries or insure normal tooth structure. As in the case of the bone disorders previously referred to, vitamin D becomes of value only when an adequate supply of calcium and phosphorus are also present. The function of the vitamin is to regulate the utilization of these elements.

Vitamin D has been produced in crystalline form and at least two forms of naturally-occurring vitamin D have been isolated. This vitamin is not present in any great amount in our common foods. The best food source is the liver oil fish, such as halibut, tuna and cod. Canned salmon, sardines, and eggs and butter are regarded as good sources, while small amounts are present in liver, cream, milk and oysters. Most other foods have no vitamin D or only minute amounts. However, various foods such as milk, yeast, cereals, etc. may be "fortified" with the vitamin by artificial means (See section on "Fortified" Foods).

When the skin is exposed to the sun, vitamin D is formed in the body. The same result may be obtained through exposure to ultra-violet ray lamps which produce radiation similar to that of natural summer sunshine. It is believed that the body has the property of storing vitamin D so that exposure to sunlight when it is most potent, may exert a protective influence over a considerable portion of the year. However, existing conditions in certain localities, such as dust, smoke and moisture in the air, also indoor living, clothing, etc., reduce the effect of sunshine so that it may be difficult, particularly for infants, to obtain an adequate supply of vitamin D from the sun. It is well known that physicians commonly prescribe vitamin D preparations, or products rich in this vitamin, for babies and young children, particularly during the winter months.

The need for vitamin D appears to be greater in infancy and childhood, in pregnancy and during the nursing period. The vitamin D requirements of adults, except those specified above, are not known at present.

VITAMIN E

Although it has been shown that an adequate supply of vitamin E is essential for normal reproduction in animals, very little is definitely known about the function of this vitamin, in the human body. Attempts to produce a market for substances containing vitamin E among would-be parents through representations that the vitamin is capable of preventing sterility or promoting physical vigor have been banned by government agencies. One of the richest known sources of vitamin E is wheat germ oil (also seeds of legumes, muscle meats, egg yolk, milk and milk products, are good sources), but vitamin E is so widely distributed among so many common foods and so resistant to destructive action that, so far as is known, the necessary amount will accompany any ordinary diet. Accordingly, claims implying a need for special sources of vitamin E in the diet or recommendations for use of a particular preparation because of its vitamin E content are, up to date, deprecated by authorities generally.

VITAMIN F

The term "vitamin F" has been used to refer to at least three different substances but at the present time it has no scientific recognition. Attempts have been made to exploit "vitamin F" as a term to designate certain essential fatty acids. However, practically all nutritionists refer to this dietary factor as the "essential fatty acids." Furthermore, no evidence has been found to satisfactorily establish that there is any lack of essential fatty acids in the average normal diet of either babies or older persons. Neither governmental agencies nor authorities on nutrition recognize the existence of any dietary factor under the name "vitamin F."

VITAMIN K

One of the latest vitamins to be discovered, vitamin K, is necessary for the formation of prothrombin, one of the substances which enables the blood to clot. Because it is widely distributed and occurs in a variety of foods, (for example, spinach, kale, tomatoes, oat sprouts) the average person need not worry about failure to secure an adequate supply of vitamin K if the diet is normal otherwise. In fact, deficiencies generally do not come from inadequate diet, but from faulty absorption which occurs when there is not enough bile in the intestines. Vitamin K is useful primarily in surgery.

SERVE TO CONSERVE VITAMINS

Substantial proportions of certain vitamins present in foods in their natural state may be lost unless the housewife observes proper precautions in the cooking and serving of such foods. While certain vitamin losses during cooking are unavoidable, considerable quantities of these valuable protective substances are needlessly thrown away every day. For example, vitamin C, vitamin B_1, vitamin B_2 and nicotinic acid all dissolve readily in water and the water in which foods are cooked may acquire considerable amounts of these vitamins in proportion, depending upon the amount of water used. These amounts are lost unless the water is utilized in making gravies, soups, etc. Soups, because of the method by which they are cooked, whether in cans or not, retain a large proportion of the natural contents of the ingredients used. Other losses may be involved in certain practices frequently employed in cooking. Cooking fruits and vegetables with skins on may help to preserve vitamins.

Vitamin A is gradually lost, and there may be serious destruction of vitamin C during storage of foods. Vegetables which are allowed to wilt, for example, suffer a loss of vitamin C and some loss of vitamin A. The bruising, peeling, cutting or chopping of fresh fruits or vegetables accelerates the loss of vitamin C, although the acid in such foods as tomatoes and citrus fruits helps to preserve vitamin C, and extracted juices from these may be stored in the refrigerator for two or three days and still retain considerable quantities of this vitamin. Foods lose vitamin A and particularly vitamin C during slow drying. Obviously, therefore, it is desirable to obtain fruits and vegetables in the freshest state possible and serve them as promptly as possible.

To assist housewives in the preservation of vitamin values in cooking and serving foods, the Bureau of Home Economics of the U. S. Department of Agriculture, offers the following practical suggestions:

Don't stir air into foods while they are cooking.

Don't put foods through a sieve while they are still hot.

Don't use soda in cooking green vegetables.

952

In boiling foods, raise the temperature to the boiling point as rapidly as possible.

Use as little water as possible.

Don't use long cooking processes such as stewing when shorter methods are feasible.

Don't throw away the water in which vegetables have been cooked. Use it in making gravies, sauces, and soups.

Don't fry foods valuable for their content of vitamins A, B_1 or C.

Prepare chopped fruit and vegetable salads just before serving.

VITAMINS IN CANNED FOODS

Generally speaking, canned foods compare favorably with fresh foods in vitamin values. When canned under proper conditions, they retain practically the same vitamin A value as fresh foods and with modern methods of canning, it is possible to exclude air so completely that fruits or vegetables canned immediately after picking are important sources of vitamin C. Properly canned citrus fruit juices, tomato juice and pineapple juice, for example, are recognized as excellent sources of this vitamin. In fact, canned foods may be superior in vitamin C content to "fresh" foods which have been exposed to heat or air or light for any considerable period. The same precautions in cooking canned food should be observed as in the case of fresh food. It is particularly important to utilize the full contents of the can in cooking in order to avoid loss of water soluble vitamins which would result if the housewife discarded the liquid portion of the canned food.

VITAMINS IN FROZEN FOODS

The quick-freezing of fresh foods immediately after harvest preserves and retains color, flavor, vitamins, and nutritional food values. Quick-freezing reduces the probability of loss of vitamins due to chemical changes that may take place during the time involved in the distribution of so-called fresh fruits and vegetables to the consumer. However, frozen foods lose certain vitamin content rapidly after they have been allowed to thaw. Accordingly, they should be kept in frozen state or cooked immediately upon removal from refrigeration. Frozen foods to be eaten without cooking should be served immediately after thawing.

"ENRICHED" OR "FORTIFIED" FOODS

In order that we may have a more abundant supply of vitamins in the foods included in the ordinary diet, some foods are now subjected to processes whereby additional vitamins are added to them.

Milk, for example, which is one of our most valuable foods, is frequently sold today with added vitamin D. There are several methods of fortifying milk with vitamin D. It may be accomplished, for example, by adding vitamin D in concentrated form to the milk; by feeding to cows foods which are rich in vitamin D; or by subjecting the milk to ultra-violet rays. Milk which has been fortified under the latter process, is described as "irradiated milk." Similarly, chickens are sometimes provided with foods rich in vitamin D so that their eggs may have added vitamin D value.

The term "enriched" has a particular connotation due to the fact that official standards for "enriched" flour have been promulgated by the Food and Drug Administration. A number of states require this enrichment of flour or bread, but it is not yet required by federal law. Recently, there has been much talk about "enriched" products. The reason for this is that certain members of the vitamin B complex and other valuable elements are concentrated in the coarse outer portions of grains which are discarded under many milling processes. Therefore, ordinary white flour and bakery products made with it, are poor sources of these valuable substances. Now, however, it is possible to retain or to restore them to a great degree. Thus, "enriched" flour is white or near-white flour which has in it specified amounts of vitamin B_1 (thiamin), B_2 (riboflavin), nicotinic acid, and iron, and it may also contain certain amounts of vitamin D, and calcium. "Enriched" flour may be made by special methods of milling wheat, which save the recommended amounts of vitamins and minerals; or more commonly by adding to plain white flour the recommended amounts of vitamins and minerals; or by combining these methods. Although official standards for "enriched" bread have not yet been promulgated, it is bread which has in it the added vitamins and minerals present in "enriched" flour. It may be made with "enriched" flour; with plain white flour and leavened with a special yeast enriched with these dietary factors; by the direct addition of vitamins and minerals; or by a combination of these methods. "Enriched" flour and bread are important supplementary sources of these vitamins and minerals often lacking in the diet and provide a stronger "staff of life" for everyone.

To give another example, butter is an important source of vitamin A in the ordinary diet. The same could not be said for oleomargarine which many people have used as a substitute for butter. Oleomargarine is now often sold with vitamin A added to it.

Other examples of foods which have been fortified with vitamins could be given. Under proposed regulations covering these and other foods offered for special dietary purposes, the Food and Drug Administration either will establish standards or require adequate labeling. So read labels carefully.

The "enrichment" or "fortification" of various foods with vitamins represents one of the greatest developments in nutrition for the common

954

good. For example, one accustomed to eating white bread from which certain members of the vitamin B complex and other valuable elements had heretofore been lost in the manufacturing process, may now obtain, without additional expense, "enriched" bread in which vitamins and minerals, once lost, have been retained or restored.

VITAMIN CONCENTRATES

In addition to obtaining vitamins from ordinary foods, it is possible to secure them in concentrated or synthetic form as tablets, capsules, etc. Such a product may furnish a single vitamin or a combination of several vitamins, and, possibly, certain minerals. Food and Drug Administration regulations require that the proportions of the minimum daily requirements of vitamins and minerals supplied by the product, be specified in the directions on the label. Those purchasing such a product should scrutinize the label carefully as some vitamin mixtures may include large amounts of the less expensive vitamins, but only inconsequential amounts of others which are more expensive. Governmental action is being initiated for the purpose of requiring that if a vitamin is listed as contained in such a product, it must be present in consequential amount. Physicians frequently prescribe concentrated vitamin preparations for a specific purpose depending upon diagnosis. The amount or type prescribed will depend upon the particular deficiency or ailment of the patient.

Every one will agree that the average healthy individual should secure his supply of vitamins from a proper amount and selection of daily food, and that he who does so, is under no necessity of increasing this amount by other means. With one or two exceptions, it is believed that any excess of vitamin intake is not stored up for future use. Vitamins are but one group of many dietary essentials and concentrated vitamins are not a substitute for a well-balanced diet. Adequate amounts of properly selected and properly prepared protective natural foods will provide not only the known vitamins, but also whatever unknown vitamins there may be, and the other nutritional essentials in addition to vitamins.

Proper selection and *proper preparation* of foods are the all-important key words to healthful nutrition. Without them, no one can say he is receiving all the vitamins and minerals he needs. Mass diet studies conducted by the U. S. Department of Agriculture have shown that 75% of Americans receive *less* than the proper amounts. The answer to this problem is better diets, with protective natural foods, the use of "enriched" foods, and an appropriate use of vitamin supplements. Those who do not or will not obtain adequate vitamin values by a properly regulated diet may be aided by vitamin concentrates supplementing their diet, if appropriate selection is made according to their needs.

1889

VITAMINS FOR EXTERNAL USE

Various products such as cold creams, soap, and hair tonic have been offered to the public upon representations that because of their vitamin content they possess certain cosmetic values. In a number of cases the Federal Trade Commission has ordered the discontinuance of such representations.

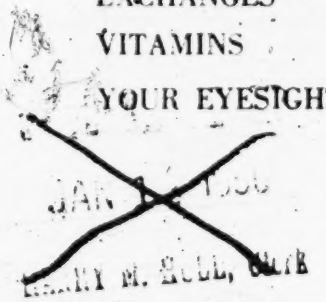
CONCLUSION

Do not forget that the current interest in vitamins today is but one phase of a national trend toward better diet. The importance of vitamins, essential as they are, should not be over-emphasized. One cannot live upon vitamins alone, for the body needs minerals, such as calcium, phosphorus and iron, and also protein, fats and carbohydrates. It is hoped that this booklet will stimulate readers to explore the general subject of nutrition more thoroughly.

It is to be emphasized that one need not spend exorbitant sums to secure an adequate supply of vitamins and other food essentials in the daily diet. It is primarily a question of selecting proper foods and budgeting food purchases wisely. Those suffering from malnutrition are not confined to the under-privileged, but include a high percentage of the population that can well afford to and does spend considerable money for food. Too many people who have been eating adequate *amounts* of food, from the caloric standpoint, have nevertheless not been eating the *right kinds* of food from the standpoint of vitamin and mineral content.

Authorities say that, for an adult, about 60 per cent of the food calories should be in the form of starches and sugars, about 25 to 30 per cent in the form of fat, and about 10 to 12 per cent in the form of protein. In addition, a wide range of minerals and vitamins must be supplied. All this can be obtained from a well-balanced diet.

Such a diet should include, daily, adequate amounts of milk, eggs, meat; green and yellow vegetables; fruit (particularly citrus fruit or tomato); potato; butter; cereal and bread, especially whole grain or "enriched"; sugar, fat, and other food to complete the calory needs. The exact amounts required will vary according to the age, size, activity, and state of health of the individual.



956

FACT BOOKLETS

Business, through Better Business Bureaus, is publishing a series of FACT booklets as aids to consumers in their everyday money management problems and relations with business. The booklets are published in the interest of consumer education. Other booklets are in process of preparation. Additional information available on request. The booklets published to date include:

FACTS You Should Know About

ADVERTISING
BORROWING
BUDGETING
BUYING OR BUILDING A HOME
BUYING USED CARS
COMMERCIAL BANKS AND TRUST COMPANIES
COSMETICS
DOMESTIC TEXTILE RUGS
FURS
HEALTH CURES
HOUSEHOLD PESTS

1892 PLAINTIFF'S EXHIBIT 6

EXHIBIT B

1. MODERN HOME MEDICAL ADVISER (1949) edited by Morris Fishbein.

The following chart appears at the conclusion of Chapter 18, DEFICIENCY DISEASES by Russell M. Wilder and Hugh R. Butt, *supra* Exhibit A.

Pages 504-505:

Resume of the Known Vitamins, Their Names, Sources, Purposes, and Deficiencies

Vitamin	Other Names	Sources			Excellent Purposes	Deficiency Leads To
		Fair	Good	Excellent		
A	Anti-ophthalmic Anti-infective Growth promoting Fat soluble A Carotene or provitamin A	Fruits	Tomatoes Whole yellow corn Hen's eggs Ordinary green vegetables	Butter Cod-liver oils Other liver oils Spinach Kale Turnip greens	Maintains integrity of epithelial (covering) tissues, thereby helping in part to prevent infections Promotes growth and vigor Essential for reproduction	Lowered resistance to infection of many organs, especially of the eyes (xerophthalmia) Failure of growth of children Loss of vigor Night blindness
B	B_1 Anti-neuritic Anti-beriberi Thiamine Chloride	Green vegetables	Heart, liver, kidney, eggs, milk Whole cereals Lean muscle Meat	Wheat germ Yeast	Promotes appetite and digestion Stimulates body activity Overcomes some forms of neuritis	Loss of tone of digestive tract Fatigue Depression Loss of appetite Forms of neuritis
	B_2 Riboflavin	Whole wheat Dried beans Soya beans	Wheat germ Meat Green vegetables	Dried yeast Milk Eggs Heart Kidney	Extrinsic factor in pernicious anemia (Castle)? Necessary for normal growth Development of cells	Disorders of growth Digestive disturbances. Nervous weakness Infection
	Nicotinic Acid	Milk Wheat germ Lean meats	Green vegetables Beans	Yeast	Prevention of features of pellagra	Nerve, skin and intestinal disturbances

Vitamin	Other Names	Sources			Excellent Purposes	Deficiency Leads To
		Fair	Good	Excellent		
1893						
C	Anti-scorbutic Ascorbic acid Cevitamic acid	Fresh apples and onions	Bananas Pineapple Collards Green peas	Green peppers Tomatoes Grapefruit Lemons Oranges Tomato juice Cabbage	Protects body from scurvy Required for proper formation of bones and teeth	Scurvy Softening of bones Decay of teeth Loss of muscle strength Hemorrhage
D	Anti-rachitic Irradiated ergosterol Viosterol	Milk or butter	Eggs	Cod-liver oil Sunlight Artificial ultra-violet lights Irradiated ergosterol (viosterol)	Proper calcification (hardening) of bones Prevents rickets	Rickets Bone deformities Defects and caries of teeth General muscular weakness
E	Anti-sterility	Whole cereals	Whole wheat Lettuce Watercress	Wheat germ	Necessary for reproduction in animals and man?	Sterility (noted in animals only) Failure of reproduction (noted in animals only)
K	Anti-hemorrhagic vitamin	Grass	Alfalfa	Concentrates	Prevention of hemorrhage by maintaining concentration of prothrombin in blood	Tendency to bleed, in newborn infants and in patients who have jaundice
Vitamin B Complex	Vitamin B complex includes also filtrate factor; vitamin B_3, 4, 5, and 6	These factors are known particularly for effects in absence in animals but have been related to complications of pellagra and similar disturbances in human beings. Pantothenic acid (filtrate factor) is related to graying of hair in human beings. Vitamin B_6 (pyridoxine) is related to some chronic nervous disturbances.				

1894 2. NEW AND NON-OFFICIAL REMEDIES (1948), issued under the direction and supervision of the Council on Pharmacy and Chemistry of the American Medical Association.

Page 530-531:

"*Allowable Claims.*—1. Evidence for the existence of vitamin A and its role in human nutrition is based on the fact that a characteristic eye disease, usually called xerophthalmia, results from a deficiency of this vitamin.

"2. It is generally agreed that the first symptom or at least one of the first clinical symptoms of vitamin A deficiency is night-blindness, or nyctalopia. For this type of night blindness vitamin A is a specific . . .

"3. Vitamin A is reported to be effective in the treatment of certain types of hyperkeratosis of the skin of persons suffering from severe deficiency of vitamin A.

"4. Vitamin A in excess of normal requirements has not been shown to be of value in the prevention of colds, influenza and such infections.

"5. There is at the present time inadequate evidence to warrant the claim that the ingestion of sufficient vitamin A will prevent the formation of renal calculi in man or that it is useful in the treatment of hyperthyroidism, anemia, degenerative conditions of the nervous system, sunburn, or ulcerative conditions of the skin."

Page 532-533:

"*Allowable Claims.*—1. Thiamine is of value in correcting and preventing beriberi.

"The general opinion of the students of beriberi is that this disease with its nervous and cardiovascular manifestation is due primarily to an insufficient supply of thiamine. It is probable that in the majority of instances of human beriberi
1895 there are also deficiencies of food constituents other than thiamine. There are conditions which probably could be designated as 'latent beriberi'; it does not seem wise at this time to attempt the formulation of a definite statement covering such conditions other than that presented in Item 5.

"2. Thiamine may be cited as of value in correcting and preventing anorexia of dietary origin in certain cases.

"There are many causes of anorexia, some referable to infections and the reactions thereto, others to organic disorders, and still others related to faulty diet. Where there is no rather obvious cause of anorexia in question other than a possible dietary one, it is permissible to claim that thiamine may be of therapeutic value when the condition to be treated is due to a deficiency of that vitamin.

"3. The administration of thiamine in excess of that present in the ordinary diet may be advantageous when there are specific conditions indicating interference with proper assimilation of the vitamins.

"The present status of research on the clinical use of thiamine for specific diseases other than beriberi and for infant feeding, is such that *definite* claims for therapeutic value in relation to such diseases cannot be recognized. Its use may be indicated, however, in such restricted conditions as pernicious vomiting of pregnancy, tube feedings through a jejunal fistula, and the like; because the above permitted statement applies to such conditions and gives an intelligent basis for such therapy.

"4. While it has not been established that thiamine deficiency is the sole cause of conditions described as alcoholic neuritis, the neuritis of pregnancy and the neuritis of pellagra, there is some definite evidence of the value of this vitamin in the
1896 treatment of these conditions. Vague representations with respect to the value of thiamine in the treatment of other types of neuritis are not permissible.

"5. Thiamine deficiency in animals is associated with dysfunctions of the heart and of the vascular system. Thiamine is effective in reestablishing the normal function of the cardiovascular system if the dysfunction was caused by thiamine deficiency. Evidence is lacking that thiamine is effective in any other type of heart disease. At times organic heart disease and beriberi heart coexist. Administration of thiamine is justified in these patients.

"6. It appears that there is an increased requirement for thiamine when there is greatly augmented metabolism such as occurs in febrile conditions, hyperthyroidism, or vigorous muscular activity."

Page 534:

"*Allowable Claims.*—1. Riboflavin is recognized as a specific in the treatment of certain characteristic lesions of the tongue, the lips, and the face. The symptoms may be described briefly as follows: A typical glossitis may often be observed before other signs of riboflavin deficiency are present. In contrast to the glossitis of pellagra, the tongue is clean, the papillae are flattened or mushroom-shaped rather than atrophic, and the color is definitely purplish-red or magenta instead of being scarlet as in nicotinic acid deficiency. As the disease progresses, the lips become reddened, then shiny and denuded, with maceration and fissuring of the angles of the mouth (cheilosis). Frequently, seborrheic follicular keratoses occur at the nasolabial folds and even over the nose and forehead. The above

symptoms are promptly alleviated by the administration
1897 of adequate amounts of riboflavin.

"2. Riboflavin deficiency is responsible for certain ocular manifestations characterized by itching, burning and a sensation of roughness of the eyes (keratitis), accompanied by mild photophobia. The anatomical changes may vary from a superficial invasion of the cornea by capillaries to an extensive vascular proliferation, with or without infiltration, opacity, and exudate formation. These symptoms, when due to a riboflavin deficiency, are relieved promptly by the administration of the vitamin.

"3. It is permissible to recommend the use of riboflavin for the alleviation of symptoms of riboflavin deficiency encountered in other diseases, notably pellagra."

Page 535:

"*Allowable Claims.*—1. Nicotinic acid and nicotinamide are recognized as specifics only in the treatment of pellagra."

Page 537:

"*Allowable Claims.*—1. Ascorbic acid is acceptable for the correction and prevention of scurvy. Definite claims for the therapeutic value of ascorbic acid should be permitted only in relation to scurvy until further clinical or experimental evidence has substantiated its usefulness in other states.

"2. It may be permissible under certain conditions to refer to the therapeutic value of ascorbic acid in early and latent scurvy. Convincing clinical evidence has established that this state does occur. It would be well to emphasize the fact that the diagnosis rests, however, on the basis of roentgenologic evidences in the long bones, the blood level, and possibly failure to excrete an optimum amount of ascorbic acid in the urine.
1898 "3. Dental caries, pyorrhea, certain gum infections, anorexia, anemia, undernutrition and infection alone are not in themselves sufficient indications of ascorbic acid deficiency but according to experimental and clinical investigation may be concomitant signs of ascorbic acid deficiency. Therefore, it is permissible to accept the claim for the therapeutic value of ascorbic acid in these symptomatic conditions *only when* it is definitely stated that they are the consequences of a deficiency or suboptimal amount of ascorbic acid or when there is a pathologic interference with assimilation of the amount necessary for the preservation of health. . . .

"6. A reasonable general statement regarding allowable claims for ascorbic acid would be as follows:

"An optimum amount of ascorbic acid should be supplied at all ages for its therapeutic value in preventing the development of acute or latent scurvy."

Page 540:

"*Allowable Claims.*—1. Vitamin D is recognized as a specific in the treatment of infantile rickets, spasmophilia (infantile tetany) and osteomalacia, diseases which are manifestations of abnormal calcium and phosphorus metabolism. Vitamin D is valuable in the prevention as well as in the curative treatment of these diseases. Complications such as renal insufficiency or glandular malfunction may preclude normal response to vitamin D therapy. During acute infections, especially of the gastrointestinal tract, vitamin D may prove ineffective because poorly absorbed. . . .

"3. There is clinical evidence to justify the statement that vitamin D plays an important role in tooth formation. Likewise experimental evidence justifies the statement that
1899 vitamin D is a beneficial factor in preventing and arresting dental caries when the intake of calcium and phosphorus is liberal and the diet is adequate with respect to other nutrients. Claims should not state or imply that vitamin D is the only important factor in caries prevention or arrest.

"4. Animal experimentation has shown that correction of an inadequate intake of vitamin D results in the more economical utilization of calcium and phosphorus and also that the undesirable effects of improper ratios of calcium and phosphorus in the diet can largely be overcome by normal intake of vitamin D. The importance of these observations in their application to man is not entirely apparent because of the lack of adequate clinical evidence showing the availability of different forms of calcium and phosphorus, but it may be stated that vitamin D has a favorable influence on calcium and phosphorus metabolism."

Pages 542-543:

"*Allowable Claims.*—Vitamin K, both in its crude form and in certain related naphthoquinones with analogous antihemorrhagic activity, seems to have a specific effect on prothrombin deficiency occurring under certain sets of circumstances:

"1. In primary dietary deficiency of vitamin K which, while admittedly rare, does exist.

"2. In obstructive jaundice, in which vitamin K has proved to have an extraordinary protective effect against hemorrhagic diathesis.

"3. The hemorrhagic state associated with primary hepatic disease is controlled in part, but not entirely, by vitamin K and by the naphthoquinones with analogous activity. The difficulty seems to lie in the fact that the liver cannot utilize
the material in the formation of prothrombin, except
1900 to a limited degree.

"4. The hemorrhagic states, which exist in connection with certain intestinal diseases such as ulcerative colitis, sprue and celiac disease, characterized by either a loss of continuity of the intestinal tract or by a disturbance of its absorptive surface, are also affected in a specific manner by vitamin K."

3. THE PHARMACOLOGICAL BASIS OF THERAPEUTICS (1941) by Louis Goodman and Alfred Gilman, Assistant Professors of Pharmacology and Toxicology, Yale University School of Medicine.

Page 599:

"*Calcium Requirements.* The body is in constant need of the calcium ion. This is obtained from the diet and it is only in abnormal circumstances that this source need be supplemented. The average adult requires 0.45 gram of calcium daily, but growing children and pregnant and lactating women should ingest twice this amount."

Page 601:

"*Nervous System.* An excess of calcium has little effect on the function of the nervous system, but a reduction in the ionized calcium leads to a serious physiological disturbance, known as *low calcium tetany*, characterized by an increased irritability of all types of muscle. The symptoms most often observed are carpopedal spasm, laryngospasm and convulsions. An increased activity of smooth muscle is evidenced by spasm of the ciliary muscle, sphincter of the iris, esophagus, gastrointestinal tract, bladder and bronchi. Cardiac muscle likewise is affected and arrhythmias occur."

Page 1248:

"The symptoms of *mild thiamine deficiency* are not as
1901 characterisic as those of the severe form and the condition may easily escape diagnosis. It is only within recent years that the attention of the physician has been directed to the possibility that thiamine deficiency may be fairly

prevalent. The work of Cowgill (1934) on the vitamin B requirement of man offers a quantitative approach to this problem. It is now becoming more and more appreciated that beriberi is merely the fulminating type of a not uncommon deficiency disease. It is not only in the Orient that economic stress sufficient to limit the thiamine content of the diet exists. The symptoms consist of loss of appetite, muscular weakness, pains and paresthesias in the extremities, a tendency to edema, decreased blood pressure and low body temperature. The diagnosis may be confirmed by a careful study of the dietary history. Thiamine deficiency, however, may occur in association with an apparently adequate diet, for the vitamin is not stored in the body to a great extent. Thus, an increase in metabolic rate or gastro-intestinal disturbance, such as diarrhea of fairly long duration, necessitates an increased thiamine intake. Mild deficiency is also observed in infancy, and childhood. The symptoms are pallor, loss of weight, restlessness, slight stiffness of the neck and spasticity of the extremities."

Page 1256:

"The chief symptoms referable to the digestive tract are stomatitis, enteritis and diarrhea. The tongue becomes very red and swollen and may ulcerate. There is also excessive salivary secretion and the salivary glands may be enlarged. Diarrhea is recurrent. The stools are watery, and may occasionally be bloody. Nausea and vomiting are also common. Gastric achylia is observed in about 50 per cent of the cases.

"Symptoms referable to the nervous system consist of
1902 headache, dizziness, insomnia, depression and impairment of memory. In severe cases, delusions, hallucinations and dementia may appear. Motor and sensory disturbances of the peripheral nerves also occur.

"In addition, certain cases of pellagra manifest a macrocytic, hyperchromic anemia (page 1137)."

Page 1257:

"*Symptoms of Mild Deficiency.* A milder degree of deficiency has been termed 'sub-clinical pellagra.' The patients are nervous, irritable and complain of headache and insomnia. They also suffer from indigestion, occasionally nausea and vomiting, and may have diarrhea or constipation. A certain degree of pigmentation of the skin often exists and there is a burning sensation in the affected cutaneous areas."

4. DISEASE OF METABOLISM, (1947), edited by G. G. Garfield, Director of Medical Division, Pennsylvania Hospital, Clinical Professor of Medicine, Jefferson Medical College, Philadelphia.

The following excerpts are from Chapter 8, "Vitamins and Avitaminoses" by Tom D. Spies and Hugh R. Butt, *supra* Exhibit A.

Page 397:

"Decreased facility for *dark* adaptation is one of the earliest functional changes associated with deficiency of vitamin A."

Page 397:

"Dryness and scaliness of the skin are perhaps among the earliest manifestations of involvement of the skin resulting from deficiency of vitamin A."

Page 401:

"It must be remembered that in the presence of
1903 diarrhea or jaundice (in infants) larger doses of vitamin A must be administered."

Page 403:

"*Skin Lesions*—Within the past few years, several groups of investigaters have reported patients who had cutaneous lesions which were considered to be the result of a deficiency of vitamin A."

Page 403:

"Gastrointestinal Diseases: Patients who have chronic diarrhea require more vitamin A than is necessary for normal persons. Patients who have hepatic disease likewise require a rather larger dose."

Page 426:

"The most constant and striking findings of thiamine deficiency arise from chemical alterations which lead ultimately to degenerative changes in the nervous system."

Page 380:

"Clinically it is well known that among patients who have chronic biliary fistulas an abnormal tendency to bleed sometimes develops. It has been demonstrated that in these instances there is an associated deficiency of prothrombin in the circulating blood which can be corrected by the administration of vitamin K."

Page 392:

"Alfalfa is a rich source of vitamin K and concentrates of this material have received extensive clinical application."

Page 457:

"It is important to emphasize that a long period of ill health with symptoms of a vague non-descriptive character
1904 usually precedes the appearance of diagnostic lesions. Because deficiencies of the B-complex vitamins tend to occur as complexities rather than as single entities, it is important to separate the premonitory symptoms of spontaneous riboflavin deficiency from those of pellagra or beriberi. Prominent among such symptoms are anorexia, weight loss, weakness, and inability to perform mental work. Digestive disturbances, nervousness, vague pains in various parts of the body, burning sensations of the skin, eyes, and corners of the mouth, as well as soreness at the corner of the mouth, pain in the eyes and visual disturbances, headaches, dizziness, mental depression, insomnia, forgetfulness and mild states of confusion are common complaints."

5. Rehabilitation Through Better Nutrition (1943) by Tom D. Spies, *supra* Exhibit "A".

Page 17:

"A protracted deficiency of vitamin A results in changes in the retinal which leads to night blindness and changes in the epithelial surfaces of the body. . . . "

"The clinical signs are such that a diagnosis is possible only when the deficiency is moderately advanced. The earliest detectable result of a deficiency of vitamin A in the eyes is a slight impairment of dark adaptation. The first change which may be observed by the patient or the physician is the drying of the eye, known as xerophthalmia. . . . "

Page 18:

"From the clinical point of view, vitamin A deficiency often manifests itself in photophobia, lacrimination and inflammation, frequently followed by a purulent exudate. Physical examination may show thickening of the conjunctiva
1905 in the early stages, or there may opaqueness of the cornea. Lesions of the cornea sometimes spread with extreme rapidity, and in rare instances, sight may be lost for a few hours. . . . "

Page 18:

"Changes in the skin, which most often occur rather late in the course of the disease, give it somewhat the appearance of toadskin. . . . "

Page 20:

"In the late stages of vitamin A deficiency, a frequent respiratory infection occurs."

Page 20:

"The prodromal period may be of a long duration with insidiously advancing symptoms, trivial in nature but gaining importance by their persistance rather than by their severity. The symptoms during this time are in all probability due to a deficiency of the entire B complex rather than the deficiency of niacin alone. Before diagnostic lesions of the mucous membranes, or skin appear, there is loss of appetite which is at least in part responsible for weight loss. Ill defined disturbances of the elementary tract including 'indigestion' and changes in bowel function occur. General muscular weakness, plasitude, irritability, depression, memory loss, headache and insomnia develop without obvious reasons. Inability to work, abdominal pain, burning sensations in various parts of the body, vertigo, numbness, nervousness, palpitation, distractibility, flights of ideas, apprehension, morbid fear, mental confusion and forgetfulness frequently occur. There may be intermitten diarrhea and constipation. There is much that obviously is abnormal at this stage but nothing that is pathognomonic. Since the entire syndrome often appears
1966 without objective cause, a diagnosis of neurastagnia,
anxiety state, malingering or neurosis is usually entertained."

Page 24:

"For the most part, thiamine is concerned with the efficiency of carbohydrate metabolism and primarily with the metabolism of nervous tissue. A study of many persons developing beriberi shows that they have a prodromal period of ill health. This is much like the period described previously as the prodromal period of pellagra. It is the period when the initial nervous syndrome appears. Observations by Spies, Bradley, Rosenbaum and Knott show that some impairment of intellectual and cognitive functions exemplified by difficulties in concentration, attention, comprehension, and probably slight memory deficits, occur long before any evidence of peripheral neuritis appears. Anorexia and sometimes constipation may accompany these symptoms. Often there are profound emotional disturbances such as abnormal fears, apprehension, increased irritability, rage, hostility, depression and other emotional phenomena. All the symptoms may be manifestations of a mixed B complex deficiency. Be-

cause they frequently are relieved by the administration of thiamine, it seems evident that they constitute an important feature of early thiamine deficiency.

"Peripheral neuritis is the most common objective sign of deficiency of thiamine. Its appearance follows the prodromal symptoms by weeks or years. Initial signs are moderate weight loss, weakness and lassitude. Fatigue is prominent and is followed by sensations of heaviness and stiffness of the legs, inability to walk long distances and finally by burning and paresthesias, particularly referrable to the distal portions of the lower extremities. Cramps in the legs and thighs are a prominent complaint. Symmetrical sensory disturbances may become demonstrable."

1907 Page 25:

"Vasomotor phenomena are evident in aberrations of sweating in the involved extremities, and the pooling of peripheral blood when the extremities are dependent. . . .

"The cranial nerves may be affected in beriberi. The vagi are most commonly implicated but in the literature from the Orient, one finds that almost any of the spinal or cranial nerves or their branches, for instance, the phrenic, the recurrent laryngeal, or even the optic nerve, may show signs of the neuritis of beriberi. In most instances the sphincter muscles are not involved until late stages of the disease. When muscular degeneration is severe, the gait usually becomes altered and there is no true cerebellar ataxia. If the patient becomes bedridden, the tendency to develop decubitus ulcers, particularly in anesthetic areas, is dominant."

Page 29:

"Heart disease, due to beriberi, may be indirectly the result of involvement of the neuroregulatory mechanism of the heart. The oriental descriptions of the disease are now thought to be representative only of the very acute stages of this type of heart disease. They are characterized by dyspnea edema, a bounding pulse with wide pulse pressure, pistol shot sounds over the large arteries, tachycardia, all manifestations of a fast circulation and peripheral vasodilatation. Under these circumstances, there is marked enlargement of the heart, increased venous pressure, and pulmonary congestion. Attacks of syncope are usual and sudden death is common."

1908 Page 31 (Under the heading, "Riboflavin Deficiency"):

"It is important to emphasize the long period of ill health with symptoms of a vague, non-descriptive character that

usually precede the appearance of diagnostic lesions. Because deficiencies of the B-complex vitamin tend to occur as complexities rather than as single entities, it is impossible to separate the premonitory symptoms of spontaneous riboflavin deficiency from those of pellagra or beriberi. Prominent among such symptoms are anorexia, weight loss, weakness, and inability to perform mental work. Digestive disturbances, nervousness, vague intermittent pains in various parts of the body, burning sensation of the skin, eyes and corners of the mouth, as well as soreness at corners of the mouth, pain in the eyes and visual disturbances, headaches, dizziness, mental depression, insomnia, forgetfulness, and mild states of confusion are common complaints. Frequently none of the symptoms is objective; and there are no signs indicating that any specific system in the body is primarily affected. Such symptoms may persist for a long time after diagnostic lesions appear, and in some persons they remain constant while the specific lesions wax and wane.

"The physician who is unfamiliar with deficiency diseases may interpret these prodromal symptoms as being functional in origin. They should, however, lead him to consider the possibility of an inadequate food intake, or the faulty utilization of food playing a role in their development. Even though persons with such symptoms have no diagnostic signs of a deficiency disease, they should be observed repeatedly over a long period of time for in many cases diagnostic lesions eventually appear."

1909 6. DIETOTHERAPY (1945) edited by Michael G. Wahl, Associate Professor of Medicine, Temple University; Chairman, Advisory Committee on Nutrition, Philadelphia Department of Public Health.

The following excerpts are from Chapter 8 CALCIUM AND PHOSPHOROUS by Julia O. Holmes, *supra* Exhibit "A":

Page 152:

"Functions (of calcium). Slightly less than 1 percent of the body's calcium is not in the bone; but that small amount is absolutely essential for the maintenance of life."

"Intercellular cement. That calcium is a constituent of the cement which holds cells together has been demonstrated by tissue culture technique. When well developed sheets of epithelium from embryonic kidney, parotid gland or intestine were washed in a calcium free fluid the sheets became loosened from one another. Later when calcium was added to the solution recovery of the separated cells was rapid. Additional evidence that calcium is involved in the intercellular cement is

seen in the study of Chambers and Zweifach who perfused capillaries with fluids with and without calcium. Lack of calcium was found to weaken the cement substance between the endothelial cells with the result that extravasation of both fluids and blood cells occurred; with a calcium rich fluid cement substance was reformed and normal permability was reestablished. A conclusion has been drawn that calcium apparently acts in fixing the cement by converting it into a non-dispersible complex."

Page 153:

"Although surveys of American dietaries indicate that many persons are subsisting on diets poor in calcium, medical literature is not replete with evidence of widespread suffering and disability due to calcium deprivation. Only
1910 one reference has been found which suggests that soft tissues may be affected as a result of a calcium deficiency. In this study the administration of calcium and viosterol to pregnant women, relieved such symptoms as muscle soreness, spasms, numbness, tingling and neutritis. Disturbances in bone calcification however are probably not uncommon. Thus poor bone structure and soft skulls and early rickets have been reported in infants whose mothers ate little calcium during pregnancy. Moreover a calcium deficiency appears to be involved in two diseases of adults i.e.: osteomalacia and osteoporosis."

The following excerpt is taken from Chapter 12, VITAMIN C IN HEALTH AND DISEASE by Gilbert Dalldorf, *supra* Exhibit "A":

Page 295:

"The cardinal symptoms of scurvy appear suddenly after prolonged subsistence on inadequate diet. The characteristic manifestation of the disease is a hemorrhagic diathesis. The other cardinal symptoms are weakness and signs and symptoms due to skeletal lesions and hemorrhage.

"Essentially, scurvy is the same in all age groups; but the signs vary with the state of skeletal development, the presence or absence of teeth, and the activities characteristic of different periods of life. Thus, infants show, as the commonest symptoms, swelling and tenderness of the thighs, a disinclination to move, and pain and crying when they are handled. In infantile scurvy, too, skin petechiae are common where the diaper rubs or presses. Hemorrhagic gingivitis may or may not be common depending on whether the infant is edentulous. In general the patients appear pale and worried, are frequently febrile (scurvy

fever), and exhibit hematuria. Though limited to a few red blood cells, this last is a very common symptom. What
1911 is called 'rheumatism' is the presenting symptom in 92% of the cases (Park)."

"Adult scurvy patients also complain of 'rheumatism' and of weakness. * * * Mouth changes are often very severe. * * * Fatigue, breathlessness, and palpitations are other common symptoms."

The following excerpt is taken from Chapter 24 NUTRITION IN THE AGED by J. H. Musser, *supra* Exhibit "A":

Page 510:

"Vitamins. A consideration of mineral elements in the diet of the aged is relatively unimportant compared with a consideration of vitamin requirements in that diet. It is extremely common to find in old people clinical evidence of vitamin deficiency, notably of B complex deficiency. These deficiency expressions may have as a basis already existing disease of the gastro intestinal tract or of the liver incident to the aging process as result of which there is inadequate absorption and utilization of vitamins or poor storage of them. But the older person who has disease elsewhere than in the gastro intestinal tract or the liver may suffer from vitamin deficiency too. The chronic cardiac patient may have poor absorption as a result of chronic passive congestion. The diabetic may not obtain an adequate supply of vitamins because of dietary restrictions. The patient with chronic disease of some other type is likely to have dietary deficiency symptoms not only because of the underlying disease, but also because of an improperly balanced diet. For the person suffering from chronic disease has anorexia and will not or cannot take food substances which contain a high percentage of vitamins. Eliminating the disease condition, however, there still remains a goodly company of elderly people who fail to eat Vitamin rich foods which might prevent deficiency expression."

1912 7. THE DISPENSATORY OF THE UNITED STATES (24th ed., 1947) by Arthur Osol, Professor of Chemistry and Director of Chemistry, Philadelphia College of Pharmacy and Science; and George E. Farrar, Associate Professor of Medicine, School of Medicine, Temple University.

Page 773:

"The outstanding pathological conditions produced by this avitaminosis are karatinization of epithelium, apparently of all mucous membranes of the body and loss of the visual purple

from the retina. As a result of the former, there is diminution in the secretion of the salivary gland, lacrimal and perhaps others; this effect seems to be due rather to the blocking of the ducts by desquamated cells than by an action on the secretive cells. The unhealthy condition of the mucous membrane of the respiratory tract renders animals abnormally susceptible to respiratory infections." (Citing Journal of the American Medical Association, 1940, Volume 114, Page 386). "Lehman and Rapaport have described a specific form of dermatitis which is apparently due to lack of vitamin A; the characteristic appearance of this was a karatotic plugs projecting from the hair follicles and causing a peculiar roughness of the skin. Apparently also the desquamated epithelium in the urinary tract may act as a nidus for the formation of stones of the kidney, provided the conditions are such as to encourage the precipitation of calcium salts."

Page 774:

"The symptom which first drew attention to this avitaminosis is the peculiar inflammation of the conjunctiva and cornea of the eye known as xerophthalmia, which may lead on to
1913 necrosis and ulceration. It is interesting to note that in young growing children, tooth enamel which is the product of epithelial cells, does not develop normally if there is lack of vitamin A."

Page 115:

"The outstanding symptoms of scurvy are great fragility of the blood capillaries as shown by tendency to hemorrhages either external or internal on the slightest injury, improper development of the teeth or softening of the matured teeth and great muscular weaknesses." * * * patients often show evidence of degeneration of skeletal muscles, anemia, enlargement of the heart, atrophy of the adrenals, lowered resistance to infection and disturbance of calcium metabolism."

Page 740:

"The characteristic symptoms of pellagra are dermatitus, diarrhea and dementia. The skin becomes red, resembling sunburn, this involves chiefly the unclothed area of the body. The skin is dry and scaly and often thin. Lesions of the skin become dark brown in color and desquamate; scars remain. The tongue and mouth become scarlet red in color and swollen so that indentations are seen where the teeth have been in contact with the tongue, large red fungi forms of papillae may stand out

over the dorsom of the tongue later there is atrophy of both the fungi form and filliform papillae and the tongue may appear pale and smooth; multiple deep fis-ures often form. There is headache, vertigo, insomnia, depression, irritability and loss of memory usually precedes the dementia."

1914 Page 985:

"The clinical manifestations of riboflavin deficiency likewise have been the subject of controversy. It was noted that some cases of human pellagra, which were refractory to nicotinic acid, recovered when riboflavin was added to the diet. Sebrell and Butler (Public Health Report 1939, Vol. 54, Page 2121) reported a peculiar inflammation of the buccal buchosa (cheilosis), which was caused experimentally in healthy humans by the exclusion of riboflavin from the diet. Johnson and Eckhardt, having observed changes in the cornea of riboflavin-deficient rats, employed this substance in the treatment of keratitis in humans. The clinical manifestation of ariboflavinosis were listed by Cayer (Journal AMA 1946, 132, 558), as follows: lacrimation, photophobia, sore tongue and mouth, magenta glossitis, cheilisis, seborrhea of the naso-labial hole, ears and forehead, vascularization of the cornea, and decreased urinary excretion of riboflavin." . . . "Nevertheless, the presence of these manifestations is an indication for treatment with riboflavin. The study of the nutritional status of the population in Newfoundland by Amundsen, et al (Canadian Medical Association Journal, 1945, 52, 227) contains excellent photographs in color of the lesions. The lips become red and shiny with a very thin and often scaly epithelium. Erythema spreads from the angles of the lips over the cheeks, and results in scars that radiate from the angles of the mouth; in some instances, this takes the form of a moist, white macerated area at the angles of the mouth, although this lesion is also associated with other etiological factors. The tongue has a characteristic magenta color (cyanotic red), and is often cleaned with enlarged fungiform papillae. The eye manifestations consist of hyperemia of the conjunctive, circum-corneal injection, photophobia and
1915 eventually, vascularization of the cornea with opacity of the cornea which interfers with vision. The eye lids become swollen and red and have a dry exudate from them. Erythema extends laterally from the external canthus, somewhat similar to the lesion at the angles of the mouth, and there is often a suborbital area of erythema. A diffuse purplish-brown discoloration of the eyelids occurs but it is not pathognomonic of ariboflavinitis since it is associated with other conditions."

Page 1209:

"The first scientifically demonstrated avitaminosis was the disease known as beriberi which Eijkman showed in 1897 could be cured by rice polishing. Beriberi has been well known among the Asiatics for nearly a century. There are two types recognized, one commonly known as 'dry' beriberi, in which the predominant symptoms involve the nervous system, especially the peripheral nerve fibres of the lower extremities. Degenerative changes are found in the ganglion cells of the nervous systems with degeneration of the myelin sheath and fragmentation of the axis cylinders of the peripheral nerves and atrophy and degeneration of the muscles supplied by these nerves. In the second form, commonly referred to as 'wet' beriberi, the outstanding manifestations are in the circulatory apparatus, and include edema, increased venous pressure, tachycardia, low voltage and 'T' wave changes in the electrocardiogram, increased cardiac output (in spite of the findings usually associated with congestive heart failure), increasing rate of circulation, enlargement of the heart, particularly of the right side, capillary pulse and pistol shot sounds over the large arteries, gallop rhythm of the heart, often syncopal attacks, and response to th-amine therapy but not to digitalis. Early symptoms of thi-
1940 amine deficiency are changes in mental attitude, and behavior, anorexia, fatigue, emotional instability, lassitude, lack of cooperation and deterioration of judgment and foresight. Endurance is decreased. Tenderness of the gap muscles, muscular weakness and pain may occur in the lower extremities. The blood pyruvic acid is increased and the glucose tolerance is decreased."

Page 1210:

"Although frank beriberi is uncommon in the United States, sub-clinical deficiencies are quite prevalent, and apparently have greatly increased in the last few years. This increase is due to change in our dietetic habits, the most important of these habits being the enormous increase in the use of sugar and the excessive milling of flour and other cereals. Thiamine is not concentrated in any of our ordinary foodstuffs, the most important source in the normal diet being the cereal grains, such as wheat, rice, oatmeal, and so forth. In these grains the vitamin is limited almost entirely to the seed coat and is removed in the effort to produce the white flour. As the need for thiamine rises with an increased proportion of carbohydrates in the diet, an augmented intake of sugar which contains of course no vitamin, increases the amount of thiamine which the body requires. So marked is this effect of sugar that in some patients an intra-

venous injection of dextrose may precipitate a frank beriberi. Thiamine deficiency is especially liable to occur in alcoholics for the same reason that excessive sugar in diet causes the condition, and it is probable that many of the symptoms of alcoholism such as neuritis and delirium, are due to the vitamin deficiency. Another factor which contributes to the widespread deficiency is that the vitamin is not well stored in the body. That
1917 is, that we cannot take on excess for a few days and then go for long periods of time without renewing our supply.

"Thiamine is readily destroyed by heat in alkaline solution and may be lost in the water in which the food is cooked. Thiamine is stable in normal gastric juice. The presence of bile causes rapid loss of thiamine."

8. CHEMISTRY OF FOODS AND NUTRITION (1946 ed.) by Henry C. Sherman, *supra* Exhibit "A".

Page 231:

"The distribution and functions of calcium have been studied in greater detail than those of magnesium. It is estimated that over 99% of the calcium in the body belongs to the bones, the remainder occurring as an essential constituent of the soft tissues and body fluids. * * * The blood contains more calcium than magnesium.

"That calcium ion is necessary to the coagulation of the blood has been known and frequently cited as example of the great importance of calcium salts to the animal economy. Equally striking is the function of these salts in regulating the action of heart muscle.

"It is well known that heart muscle may be kept beating normally for hours after removal from the body when supplied, under proper conditions, with an artificial circulation of blood or a water-solution of blood ash. Howell, Loeb and others have studied the parts played by various salts * * * Calcium salts also, although occurring in blood in very much smaller quantities are absolutely necessary to the normal action of the heart muscle; while at present in concentrations above normal cause a condition of tonic contraction 'calcium rigor'. There is therefore a balance which must be maintained between
1918 calcium on the one hand and sodium and potassium on the other. Thus it is found that the alternate contractions and relaxations which constitute the normal beating of the heart are dependent in part upon the presence of a sufficient but not excessive concentration of calcium salts."

Page 234:

"Iron like phosphorous is a constituent of the chromatim substances which are often referred to as concerned with the most vital activities of the cells, and recently it appears that a small amount of iron has an essential relation to the oxidation-reduction functioning cytochrome; but much the largest part of the iron in the body exists as hemoglobin in the blood. In round numbers the blood constitutes only about seven per cent of the weight of the body but contains at least seventy percent of its total iron. The hemoglobins in different species of vertebrates differ but little; all are iron containing proteins constituting a considerable part of the red blood corpuscles and functioning as oxygen carriers in respiration."

Page 283:

"Hence an iron poor body tends to be anemic; and while anemia may be due to many other causes as well as lack of iron the studies of the adequacy of iron supply in nutrition have been closely interwoven with the studies of anemia, of hemoglobin formation and regeneration, of the history and functioning of the red cells or corpuscles of the blood.

"More recently it has been found that copper is in some way involved in the process of hemoglobin formation."

1919 9. INVESTIGATIONS OF HUMAN REQUIREMENTS FOR B-COMPLEX VITAMINS by Max K. Horwitt, Erich Liebert, Oscar Kreisler, and Phyllis Wittman, Bulletin No. 116, June 1945, National Research Council, National Academy of Sciences.

Page 50:

"MILD RESTRICTION OF B VITAMIN COMPLEX . . . Mental Activity. Mental changes came so gradually that it was difficult to know when they actually appeared. The most prominent change was a dulling of faculties involving attention, interest, ambitions, and sociability, and this change was associated with a decrease of talking and a slowing of movements. One elderly subject, AO1, who was alert, quick of movement, eager at all times to help in the first one and one-half years of the mild B vitamin complex restriction phase, withdrew from the center of activities, lost his friendliness and the briskness of his movements."

Page 73:

"In a discussion of these findings comparisons should be made with observations in other recent B vitamin restrictions studies.

"Ray D. Williams and coworkers conducted a study (1) in which the intake of thiamine was restricted to an average of 450 mcg. (220 mcg. per 1000 calories) daily in young to middle-aged female subjects who had previously suffered from psychotic episodes. Changes of attitude and behavior, diminished inclination to perform accustomed tasks, and decrease of ability to make social adjustments were observed as early signs in the subjects after eight to twelve weeks. Irritability, agitation, depression, and anxiety were also noted. The subjects complained of headache, backache, sleeplessness, tenseness,
1920 paresthesias, sensitivity to noise. Tolerance to exercise was affected. Muscles were found weak and tender. Episodes of nausea, vomiting, and epigastric distress occurred, and constipation was common. Lowering of the basal metabolic rate was seen: There were cardiovascular disturbances such as lowered blood pressure, vasomotor instability, pallor, marked tachycardia on moderate exertion, arrhythmia, electrocardiographic changes, and precordial pain. Elevations of pyruvate blood levels accompanied clinical exacerbations."

~~Page 102:~~

"Mild restriction of B vitamin complex led to physical and mental changes in these chronically psychotic, mostly sedentary, old and young male subjects. The important physical changes were regressive changes in the skin, impairment of appetite, lowering of blood pressure, slight edema, dulling of vibration sense, and diminution of deep reflex activity. The predominant mental changes were decrease of psychomotor activity, dulling of attention, loss of interest and ambition, and seclusiveness. The development of both mental and physical signs and symptoms was exceedingly slow. No definite claim of changes could be made in the first year of the experiment. There was a difference in the resistance of the age groups in that only old subjects showed signs of circulatory insufficiency. Nerve involvement was also more pronounced and more persistent in the old. The subsequent therapeutic response to yeast extract administration was, in general, rather prompt as to feeling, interest, and appetite, rather slow, though distinct, as to deep reflexes, and hardly noticeable as to regressive skin change except for slight return of lost elasticity."

1921 Page 103:

"Severe restriction of vitamin B complex in another group of rather sedentary, chronically psychotic old and young subjects led to severe physical and mental changes. The main physical changes were signs of circulatory insufficiency, of

neuropathy, of disturbed gastrointestinal motility, loss of appetite, and changes in the appearance of the skin and tongue. The mental changes were chiefly characterized by loss of inhibitory emotional control, paranoid trends, manic or depressive features, and confusion. Both physical and mental changes were acute to subacute in onset. Sometimes the emotional manifestations were explosive in character. The physical and mental changes correlated well in the individual case with rise of pyruvate and lactate in the blood, especially in blood samples taken after exercise. The therapeutic response to subsequent yeast-extract administration was dramatic as to appetite, circulation, gastrointestinal motility, appearance of tongue, certain aspects of sensibility (pains and paresthesias), and general display of energy. The recovery from loss of muscle power was rather prompt."

10. ESSENTIALS OF NUTRITION (1943) by Henry C. Sherman, *supra* Exhibit A, and Carolina Sanford, Columbia University.

Page 175-176:

"Wolback offers, as a result of his pathological research an impressive array of ways in which body function may be impaired through the effects of shortage of Vitamin C upon the integrity of the intercellular material in different bodily organs and tissues:

1922 "(1) Hemorrhages, which may occur anywhere in the body, and which are a prominent feature of the classical picture of scurvy. . . .

"(2) Structural changes in the gums and teeth, the latter having been considered by some investigators to be the most delicate structurally observable indications of shortage of vitamin C.

"(3) Changes in the growing ends of bones, sometimes causing confusion between rickets and scurvy in children.

"(4) Defective calcification due to degeneration or lack of proper development of the bone matrix.

"(5) Displacement of bones due to weakness of the supporting cartilage.

"(6) Anemia due to interference with the functioning of blood-forming cells in the bone marrow, as well as to the loss of blood by hemorrhage.

"(7) Damage to heart muscles, sometimes shown by enlargement of the heart."

11. PRINCIPLES OF NUTRITION AND NUTRITIVE VALUE OF FOOD by Henry C. Sherman, *supra* Exhibit A, U. S. Department of Agriculture Miscellaneous Publication No. 546.

Page 13:

"The body's framework or skeletal system of bones and teeth owes its strength and normal form to the fact of its being well mineralized."

Page 15:

"Calcium is one of the two nutrients in which American dietaries or food supplies most often fall below the recommendations of the Food and Nutrition Board of the National Research Council.

1923 "Calcium deficiencies in nutrition are much more frequent than physicians commonly realize, because there is no good way of detecting them. In fact, a condition which nutrition research has now shown to be one of shortage, as viewed in the light of the full life history, is still commonly counted as within the range of the normal. In the light of present knowledge of lifetime relationships it is now apparent that we are all born calcium poor. That is, the human body at birth has not only a much smaller amount but also a much smaller percentage of calcium than the normal fully developed body contains."

Page 16:

"Notwithstanding the fact that, for a large proportion of the population, the National Research Council's standards provide less safety margin for calcium than for other nutrients, shortage of calcium in American dietaries (as judged by these standards) is of outstanding frequency."

Page 24:

"But when scurvy is ancient history, vitamin C will . . . be . . . of immediate interest because of its important nutritional function."

Pages 24-25:

"It is essential to the integrity of the cement substance which lies between the cells of the body's various tissues and keeps each cell properly set and supported for the performance of its part in the work of the body. This involves, among other things, the prevention of hemorrhages or oozing of blood through tissue, which in a shortage of vitamin C may occur in almost any part of the body; the maintenance of a healthy

condition of the gums and teeth; the development and maintenance of right relations between the ends of growing
1924 bones, and of a matrix suitable for normal calcification within each bone; the prevention of some forms of anemia; and the regulation of heart muscle and of muscle tone generally.

"Moreover, there are interesting indications that vitamin C may have an important part in what has been attractively called 'the preservation of the characteristics of youth'; and King and Menten have definitely shown that liberal amounts of vitamin C in the body increase its ability to resist the toxins formed by certain species of bacteria. So it is clearly well worth while to take account of vitamin C in our choice and use of food even if we are already living safely above the scurvy level."

Page 21:

"Of much more frequent occurrence in the United States are the relatively mild but often long-continued shortages of thiamine which do not develop the typical symptoms of beriberi but may be responsible for much of our all-too-common ill-defined heart and nerve troubles. Dr. R. M. Wilder, of the Mayo Clinic, and his associates there have particularly emphasized the importance of the relatively high amounts of thiamine called for by the National Research Council recommendations, which are about double the minimum amounts which suffice to prevent beriberi."

12. THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, Volume 131, No. 8, published June 22, 1946.

The following excerpts appear under the heading COUNCIL ON FOODS AND NUTRITION. VITAMIN DEFICIENCIES: STIGMAS, SYMPTOMS AND THERAPY and it is stated that "the accompanying syllabus is a consensus of current views:"

1925 Pages 666-667:

"Stigmas suggesting deficiency of vitamin A"

"Kerosis of the conjunctiva:

Thickening with loss of transparency, so that only the more superficial vessels of the bulbar conjunctiva are clearly seen, associated with more or less yellow pigmentation, especially along the horizontal meridian of the eyeball; infrequently associated with small foamlike plaques called Bitot's spots.

"Papular eruptions of pilosebaceous follicles:

A grater-like feel, which in early stages resembles gooseflesh but, when more fully developed, presents the picture of keratosis pilaris. The extensor surfaces of the arms and thighs and the flexor surfaces of the legs are primarily affected.

"Xerosis or asteatosis of the skin:

Dryness, scaliness and crinkling, in extreme cases resembling alligator skin. In early stages the condition is associated with keratosis pilaris but it persists and extends after follicles have disappeared, the body hairs being broken and later lost. All parts of the body are involved, but the skin of the extremities, particularly of the legs, is more severely affected than the skin of the head and the trunk.

"Follicular conjunctivitis:

Hypertrophy of the follicles, particularly of the lower eyelids.

"Night blindness:

Conspicuous only in cases of advanced, severe deficiency.

1926 "Keratomalacia:

Thickening with subsequent ulceration and necrosis of the cornea; present only in most severe and advanced forms of deficiency.

"*Treatment of vitamin A deficiency*"

"Early deficiency state:

25,000 U. S. P. units of vitamin A twice daily for two months or longer.

"More chronic states:

25,000 U. S. P. units of vitamin A two to three times daily for a prolonged period:

"*Stigmas suggesting deficiency of thiamine*"

"Loss of strength of the quadriceps: disproportionate to loss of general strength, evidenced by difficulty in arising from the squatting position.

"Loss of vibration sense: first of the toes and later of the malleoli and tibias.

"Tenderness of the calves and hyperesthesia of the feet:

"Diminution and loss of the achilles tendon and patellar reflexes first. Other tendon reflexes are lost in the later stages of the polyneuritis of 'dry beriberi.'

"Edema of the shins, ankles and knee joints: found in 'wet beriberi.'

"Enlarged heart with dependent edema and elevated venous pressure: Poor response to rest and administration of digitalis unless thiamine is given. This is a late manifestation of severe deficiency (beriberi heart).

1927 "Papillary edema with retinal hemorrhages: associated with ophthalmoplegia and polyneuritis. The condition is a late manifestation of severe deficiency."

"*Treatment of thiamine deficiency*"

"Acute deficiency state:

10 to 20 mg. or more of thiamine twice daily until relief of symptoms; this may be days or weeks."

"Chronic deficiency state:

5 to 10 mg. or more of thiamine twice daily for a prolonged period."

"*Stigmas suggesting deficiency of riboflaven*"

"Congestion of the limbic plexus:

Visible with a small hand lens or the + 20 lens of the opthalmoscope; invasion of the cornea by capillaries arising from this plexus (vascularization) requires a biomicroscope and slit lamp for detection."

"Cheilosis:

Represented in chronic deficiency by excessive and irregular wrinkling, in acute deficiency by swelling and erasure of the normal wrinkling of the lips. Reddening, thinning, scaling, chapping of epithelium are associated."

"Angular stomatitis:

Various combinations of erythema and open fissuring in the angles of the mouth with or without a white, moist maceration (perleche); scars of healed fissures.

"Dysseb acia:

An erythema overlaid with somewhat greasy, flaky accumulations resembling hoar frost, noted mostly in the alae nasi,

canthi, pinnae and other folds of the skin, accompanied
1928 in some cases by coarsening and elevation of the sebaceous follicles of the nose and cheeks, the latter also seen with deficiency of vitamin A".

"Magenta tongue:

A purplish red coloring with moderate edema and flattening of filiform papillae; observed in more advanced deficiency.".

"*Treatment of riboflaven deficiency*"

"Acute deficiency state:

5 mg. of riboflaven three times daily for weeks.

"Chronic deficiency state:

3 to 5 mg. of riboflaven three times daily for a prolonged period."

"*Stigmas suggesting deficiency of ascorbic acid*"

"Redness, edema, tenderness and bleeding on pressure of the gums:

Observed in acute or subacute deficiency of moderate severity, sometimes with, but usually without, other signs of ascorbic acid deficiency.

"Thickening and increased firmness of the gums:

With recession and exposure of the base of the teeth, including recession of interdental papillae; observed in chronic deficiency.

"Retraction of the gums:

Leaving pockets between gum and tooth, secondary infection and resulting pyorrhea; observed in chronic deficiency.

"Loosening and shedding of the teeth:

"Increased capillary fragility:

Manifested by petechial hemorrhage of the skin, especially
— in the tourniquet test; observed in more severe acute and
1929 subacute deficiency. Easy bruising, spontaneous ecchymosis of the skin, idiopathic hemorrhage into joints and slow healing of wounds, observed in severe acute and subacute deficiency."

"*Treatment of ascorbic acid deficiency*"

"Acute or subacute deficiency state:

100 mg. or more of ascorbic acid for weeks.

"Chronic deficiency state:

100 mg. of ascorbic acid three times daily over a prolonged period."

"*Stigmas suggesting deficiency of vitamin D*"

"Deformities of the skeleton:

Bowed legs, malformation of the chest (funnel brest) and defects of the teeth may be residues of early rickets which is usually no longer active or susceptible to treatment; enlargment of the wrists, elbows, knees, ankles and chostochondral unetions (beading, rachitic rosary) and bulging forehead (cranial bosses) which respond to treatment are found in infancy and in the rare example of late rickets."

"*Treatment of vitamin D deficiency*"

"In infants:

1,500 to 2,500 U. S. P. units of vitamin D daily, continued for several months (double this amount for premature infants)."

"*Stigmas suggesting deficiency of vitamin K*"

"A tendency to bleeding:

Particularly from minor wounds, related to abnormal lengthening of the prothrombin time, developing spontaneously in newborn infants; observed in adults after treatment with
1930 dicumarol or large doses of salicylates; in advanced disease of the liver with poor excretion of bile, and in disease of the intestine, such as sprue in which vitamin absorption is disturbed."

"*Treatment of vitamin K deficiency*"

"In adults:

1 mg. of vitamin K two to three times daily with or without bile (1 Gm. of desiccated bile or bile salts).

"In newborn babies:

1 mg. of synthetic vitamin K intramuscularly daily in oil solution for several days."

"Deficiency Symptoms"

"A diagnosis of vitamin deficiency only rarely can be based on symptoms or less significant abnormalities than those which have been listed thus far. However, such symptoms and abnormalities frequently accompany the more specific lesions of deficiency.

"Symptoms commonly observed with deficiency of thiamine, also less conspicuously in deficiency of other vitamins, include apathy, lethargy, increased emotional irritability, hypersensitivity to noise and painful stimuli, headache, vague fears, confusion of thought, uncertainty of memory, asthenia, loss of manual dexterity, insomnia, heart consciousness, paresthesia, anorexia, nausea, flatulence, epigastric pain, constipation.

"Photophobia, burning of the eyes, lacrimation and eyestrain not relieved by glasses are encountered in deficiency of riboflavin.

"Other abnormalities unrelated to deficiency of any
1931 single vitamin but commonly observed in persons who are malnourished are dry, brittle, lack-luster, rebellious, so-called staring head hair, a loss of sleekness analogous to the rough coat of malnourished animals, blepheritis, spider-like telangiectasis of the face, seborrhea of the face, patchy pigmentation of the face, especially suborbital and circumoral, sinus arrhythmia, bradycardia, tachycardia, low blood pressure, loss of tone of muscles and anemia."

13. Recommended Dietary Allowances (Revised 1948) Circular No. 129 of the National Research Council.

Page 5:

"Studies on man, as well as more complete experience with animals, clearly indicate substantial improvements in growth and function when the intakes of certain nutrients are increased above the level which is just sufficient to prevent obvious deficiency symptoms. The level above which lesions or symptoms are not commonly observed is merely one point on a long curve relating intake to function. The allowance of a margin of intake above the critical level for each nutrient is, therefore, designed to permit additional benefits as well as to cover individual variations.

Pages 5-6:

"The usual undiscriminating view is that, if the diet furnishes enough of any given factor to meet functional need, any further amount supplied by the food is normally a matter very

nearly of indifference, significant only as a sort of insurance against some emergency. This may be true for most of the essential food-factors. Of a few nutrients, however, there is evidence from long-term (animal) experimentation that
1932 one may, in the course of a lifetime, derive increased benefit from increased intake up to levels very considerably above those of ordinarily accepted adequacy. (Ascorbic acid, vitamin A, and calcium are perhaps the best-established cases of this kind.)"

14. The National Malnutrition, by D. T. Quigley, *supra*, Exhibit A.

Page 12:

"Apparently pantothenic acid has a relatively specific effect on the hair, nails, and the skin epithelium, and the integrity of the nervous system and brain. In the animals well supplied with pantothenic acid, the skin glands appear to remain in better health, and the skin does not take on the wrinkling and aged appearance which occurs in those who are deprived of this vitamin. In human subjects, the same thing seems to be true—that a good appearance of skin, hair, and nails is preserved in those who have a sufficient amount of pantothenic acid in the diet. It has been called the vitamin which prevents old age; but this statement is of course in error. No one vitamin prevents old age.

"Earlier in our studies of vitamins, Sherman of Columbia University was convinced that the vitamin which we now call riboflavin was an important element in preventing old age. Only by a judicious combination of all vitamins, combined with sufficient minerals, do we have the answer to the problem of old age."

Page 14:

"One of the needs of human beings, monkeys, and guinea pigs is vitamin C. This vitamin has to do with the
1933 integrity of blood vessels. It has something to do with the growth and function of bones. It has a good deal to do with the nutrition of teeth (dentine). Dr. Hanke formerly of the University of Chicago made experiments (Asylum at Moosehart, Ill.) on several hundred orphans in which he showed that tooth decay and pyorrhea were caused in part, at least, by a deficiency in vitamin C. The work of the Mellanbys in England showed that vitamin C has to do with the health of the dentine, and vitamin D has to do with the health of tooth enamel. Further work by the Mellanbys in London and Hanke

in Chicago showed that the cause of tooth decay in children who were not properly nourished was associated with scurvy. 'Mouth scurvy' might as well be used instead of the term 'phorrhea' or 'tooth decay'."

Page 22:

"Calcium is excreted from the body in the discharges which comes from wounds and open sores, and ulcers. Cancer usually exists as an ulcerated area. Much calcium is lost in the fluid that seeps from the ulcerated cancer surface. The small bodily supply is further depleted; therefore the giving of calcium by mouth or by intravenous use quiets the cancer pains."

Page 23:

"In order that physiological processes may be carried on in a normal, proper way, oxygen must be carried to each individual cell. The oxygen is carried to the cells of the body by a compound which is made up partly of iron. Oxygen enters the lungs, penetrates the wall of the air cells, and enters the blood. The iron containing hemoglobin exists in the red blood corpuscles and having combined with the oxygen, carries it
c1934 to the cells, where oxidation takes place. Without iron, no metabolism and no oxidation would occur. The need for iron is constant, as much of the hemoglobin is being destroyed and excreted every day. As new supplies of calcium must be provided, so new supplies of iron must come in by way of the gastrointestinal tract in order to provide for new hemoglobin daily.

"In the life processes of the ordinary individual, around 3 percent of the red cells are being destroyed every day. This means that a certain definite amount of iron must be provided to make up for what is lost. Iron must be supplied and absorbed in the amount of 10 to 25 milligrams every day. The dilution of iron-containing foods by devitalized carbohydrates makes this optimum impossible. We may measure the amount of iron in the blood by the amount of hemoglobin present (red coloring matter)."

Page 24:

"One of the most important of the mineral needs is the need for iodine. Without iodine the thyroid gland does not properly develop. In diets which contain quantities of iodine below the normal amount, all the life processes are operating below par. The thyroid gland contains the largest amount of iodine of any of the organs of the body, and as all the blood in the

body goes through this gland every 17 minutes, it evidently serves as a trap for the filtering out of toxic material, the iodine acting as an antitoxin. A good deal of the toxic material in the blood stream is living material—that is, low-grade micro-organisms that gain access to the circulating fluids of the body. The iodine-containing thyroid undoubtedly inhibits the growth of these invading germs. In cases where the amount of iodine in the diet is definitely small, the thyroid undergoes a compensatory growth. It becomes many times larger than
1935 normal. This is evidently an attempt to furnish more thyroid cells to more effectively to filter out and use what little iodine there is in the blood stream. This function carried to excess produces the more poisonous types of goiters."

Page 25:

"The need for iodine is unquestionable. There is no doubt as to its value in providing the body with the ability to resist infections in general. . . . . In parts of the country where there is a relatively small amount of iodine in the soil, the amount to be found in the crops is correspondingly less. In parts where the iodine is practically absent from the soil, on account of having been washed out, there is very little iodine in the grains and vegetables. In these parts, goiter and other thyroid diseases are very common. In such areas as South Carolina where the iodine content of the soil is high, goiter is very much less frequent."

Page 26:

"In medical circles, iodine is known chiefly as a treatment for goiter. This element, however, since it has to do with increasing the anti-bactericidal elements in the blood, is of value in every type of goiter, arthritis, and rheumatic disease."

Page 30:

"The small child on a deficient diet becomes afflicted with chronic tonsillitis. The school child may develop tuberculosis. The youth is pimply and anemic. All have bad teeth. Many have permanently crippled hearts due to rheumatic infections. Seventy percent have rickets. A large proportion have digestive diseases and constipation. All these handicaps are the result of errors in diet.

1936 "Drs. Williams and Spies made examinations of diets in various parts of the United States, and in their book, 'Vitamin B_1' published in 1938, they said there is much sameness in diets all over the country. This sameness is largely in the enormous consumption of non-vitamin, non-mineral foods, com-

posed of white flour and sugar. The average diet furnishes a Vitamin B_1 intake of from 200 to 300 International Units. This is just enough to prevent the development of the oriental disease, —beriberi. The American population are quite evidently not getting enough vitamin B_1 and are existing on the edge of pellagra and beriberi all the time. In order to have the optimum benefit from Vitamin B_1 a person of 150 pounds weight should have from 700 to 1,000 units per day.

"G. R. Cowgill, one of the outstanding workers in this field, states: 'There are grounds for believing that American dietaries as a whole are unsatisfactory with respect to the content of vitamin B_1'."

Page 32:

"Dr. Burt Wolbach, of Harvard University, has shown that certain changes take place in the epithelium lining the windpipe and bronchial tubes of children who do not receive enough Vitamin A."

15. Arthritis and Related Conditions (1948) edited by Theodore F. Bach, *supra* Exhibit "A".

Page 108:

"Vitamin B is usually employed in the treatment of arthritis because there may be clinical evidence of its deficiency shown by the presence of anorexia, peripheral neuritis, etc. 1937 Furthermore, it has been demonstrated that carbohydrate metabolism requires sufficient quantities of the vitamin B-complex to prevent the depletion of reserve of nicotinic acid, thiamin and riboflavin."

16. Diabetes and Its Treatment (1949), Joseph H. Barach, *supra* Exhibit "A".

Page 92:

"Occasionally a patient with positive evidences of diabetic neuropathy will make a good recovery with injections of crude liver extract and general doses of multiple vitamins."

Page 94:

"It should be noted that some diabetics—refractory cases—have enlarged livers. Especially in the young diabetics, the response to adequate diet and insulin, and, in some cases, to large doses of vitamin A and B, is one of striking improvement."

1938 17. Facts You Should Know About Vitamins, copyright 1941 by Boston Better Business Bureau; Revised and Reprinted 1942-1946 by the Better Business Bureau.

"This booklet, "Facts You Should Know about Vitamins," is one of a series of fact booklets on business, merchandise, financial, and other subjects which business, through Better Business Bureaus, is publishing in the interests of consumer education—to aid consumers in their everyday money management problems and relations with business.

"The importance of proper nutrition was recognized by our government in calling the first National Nutrition Conference at Washington in May, 1941. At this conference, the need for an aggressive attack upon the problem of undernourishment in this country was brought out repeatedly. According to an official report of the Conference:

"'Something more than 40 per cent of the American people are not getting enough food and the right kind of food to maintain health and vigor—and this in spite of the fact that the foods of which we have a so-called surplus are the very ones they need. Less than one-fourth are getting a really good diet even when measured by lower standards than those to which we would subscribe today. If everyone could have an adequate diet instead of an average diet, it would add 10 years to our active life span.'

"At the same conference, Brig. Gen. Lewis B. Hershey, Deputy Director Selective Service System, stated:

"'In summary, Selective Service has examined physically a million. The results of these examinations should be disturbing to us as a people—they should energize us to immediate and positive action. Approximately 400,000 have been found
1939 unfit for general military service—probably one-third of these are suffering from disabilities directly or indirectly connected with nutrition.'

"It is now being recognized that it is important that all workers and the civilian population as a whole should be properly nourished.

"Vitamins are essential food elements which must be present in the diet in adequate amounts for health and well-being. Scientific and medical knowledge of vitamins is growing day by day, but this booklet undertakes to explain, in layman's language, some of the fundamentals as to what vitamins are, what values they possess, and where they may be obtained, although no pretense is made of giving all details or a complete list of food sources of the vitamins.

"*What Are Vitamins?* 'Vitamin' is a term given to certain food constituents which are essential for normal nutrition. They are but one of several dietary essentials. Most of us know, for example, that the diet must contain, in adequate quantities and proper balance, proteins, carbohydrates and fats which yield the energy and other requisites for life and activity and which, along with certain inorganic elements such as iodine, iron, calcium and phosphorus, form the structure of the body tissues and the fluids of the organism. In addition to these more familiar nutrients, there are other food factors essential for the preservation of bodily well-being which we commonly designate as vitamins. The absence or serious deficiency of any one of these nutrients, including any of the vitamins, from a diet which is satisfactory in other respects may lead to the development of pathological conditions which are called 'deficiency diseases,' which may be even more striking in appearance and effect than failure to get enough food.

1940 "Scientists have succeeded in isolating a number of compounds having the properties of vitamins, determined their chemical formula and have learned how to produce some of them synthetically. You can see these chemical compounds, feel them, weigh them. In fact, nutrition charts which recommend specified daily amounts of certain vitamins often do so in terms of milligrams or micrograms—measures of weight. (A microgram is one millionth of a gram.) Other nutrition charts express vitamin values in terms of International Units, U. S. P. Units and Sherman-Bourquin Units. (There are certain elements in Vitamin A, for example, which cannot be weighed.)

"No vitamin diet charts are given in this booklet because vitamin values of foods differ according to growing conditions such as soil, climate, etc. Another reason is that vitamin requirements vary according to the age, size, activity and health of the individual. However, literature on daily allowances of vitamins and other nutrients, planning meals and diets, and other food subjects, may be secured from the Bureau of Home Economics, U. S. D. A.; Children's Bureau, Dept. of Labor; and Nutrition Division, Federal Security Agency, all at Washington, D. C.; or from many local or state Health Departments.

"*Sources Of Vitamins.* Vitamins are present in a great variety of food products, in varying quantities. There is no reason why a properly selected diet should not afford an adequate supply of the requisite vitamins. Yet it is believed that a great many people fail to get enough vitamins not, primarily, because we do not get enough food but because we do not eat enough of the right kinds of food. Many of us do not get an adequate diet.

Most of us get enough vitamins to prevent specific
1941 deficiency diseases, but many people who do not develop acute or recognizable symptoms of disease nevertheless fail to secure the full amount of vitamins consistent with ideal physical well-being. This is particularly true of people who go in for 'one-sided' diets such as ill-advised reducing diets and fads of various kinds, and people who eat too much of certain groups of food to the exclusion of others. In many cases deficiency conditions may be properly corrected by the use of appropriate foods or, a corrective result may be effectively and speedily secured by the administration of various vitamins in concentrated form or products especially rich in them.

"*Vitamins Not Cure-Alls.* It must be emphasized that vitamins should not be regarded as an indiscriminate means of treating deficiency disease conditions but, rather, as an indispensable aid in maintaining normal health. While physicians do employ vitamins in the treatment of various diseases, vitamins are generally used as an adjunct to more complete measures. Although a deficiency of vitamins does cause certain deficiency diseases, some disease symptoms similar in nature may be caused by other factors which would not respond to vitamin treatment. For these reasons, treatment of deficiency disease conditions with vitamins should be left to qualified physicians. However, all of us can endeavor to prevent the appearance of ailments due to vitamin deficiency by obtaining an adequate supply of these essential elements in the daily diet. While an adequate supply of vitamins will not, in itself, assure good health or prevent all dietary deficiencies or deficiency disease conditions, the vitamins do have a vital effect on practically every organ in the body and deficiencies of them are related to a score of diseases and deformities.

"Medical scientists are still studying the effects and useful-
ness of vitamins and any peculiar or allergic effects
1942 which vitamin supplements might have on certain persons.

"There are limitations on present medical and scientific knowledge of the usefulness of vitamins in the treatment of disease. For this reason alone, one should not attempt to be his own doctor by trying to treat a disease condition by vitamins.

"*Vitamin Nomenclature.* That there are more vitamins than was originally believed is definite. What remains to be determined is how many. Many of the known vitamins have been given alphabetical names for convenience, such as Vitamin A, B_1, B_2 (G), C, D, etc. From a scientific standpoint, the most practical way of naming vitamins is to give each one its

chemical name, where known, but because the public as a whole still recognizes vitamins by their alphabetical designation, both chemical and alphabetical names are given in this booklet.

"*Vitamin A.* Vitamin A is essential for the maintenance of a healthy condition of the epithelial cells which cover body surfaces and line the body cavities such as the mouth, stomach, glands, and ducts of glands. When there is a deficiency of vitamin A, dryness and scaliness of the skin is likely to appear. It also has important functions with respect to the eyes. One of the first symptoms of vitamin A deficiency is the condition known as night-blindness. The vitamin will prevent or relieve this condition, if it is not too far advanced, when due to vitamin A deficiency. In fact, the physicians of ancient Egypt are credited with curing thousands of cases of night-blindness with liver, a rich source of vitamin A. However, there are other cases of 'night-blindness' not of dietary origin, which do not respond to treatment with vitamin A. Another characteristic eye disease called xerophthalmia also results from a more advanced deficiency of vitamin A.

1943 "Vitamin A is also highly important for normal growth and for proper tooth and bone formation in growing children, although the same can be said of other food essentials. In addition, its insufficiency in the diet may lessen the resistance of the body to infection, especially of the respiratory tract. However, vitamin A has not been definitely shown to be a preventive of specific infections, such as colds or influenza.

"Vitamin A is found in the liver and yellow body fat of most animals. In addition, various plant foods contain what are known as 'precursors' of vitamin A. These are yellow pigments called 'carotenes' which, when consumed, are transformed into vitamin A. This is the only known vitamin which is 'manufactured' by the human body from plant food. Vitamin A can be stored in the liver by man and other animals. Cod and other fish liver oils are excellent; and liver, butter, cheese, eggs and milk are good sources of vitamin A. Green and green leafy vegetables, such as green beans, beet tops, dandelion greens, spinach, swiss chard, kale, etc., tomatoes, and bright yellow fruits and vegetables, such as apricots, peaches, persimmons, carrots, yellow corn, sweet potatoes, winter squash, etc. are good sources of vitamin A precursors.

"*The Vitamin B Complex.* What was originally called vitamin B and was thought to be a single substance, has since been found to be a group of several substances and to this group is applied the term 'vitamin B complex.' While the exact number of the constituents of the Vitamin B complex is not known at present, the chemical nature of several has been determined

and they can be produced synthetically. Of them, at least three have been shown to be necessary in human nutrition
1944 and to be of value in the prevention and treatment of human deficiency diseases. They are Vitamin B_1, or thiamin, Vitamin B_2, or riboflavin, and nicotinic acid. All of these substances are usually found together in a single food product, such as yeast or liver. For the purpose of this booklet it is not deemed necessary to give detailed information on all the Vitamin B factors because scientific conclusions are still incomplete.

"*Vitamin B_1 (Thiamin).* One of the first facts to be established about vitamin B_1 was that, in the presence of a severe deficiency, a disease called beriberi made its appearance. This is a disease characterized by partial paralysis, swelling of the legs and general dropsy. Vitamin B_1 is of value in preventing as well as correcting certain forms of this disease. It is of value in the treatment of certain types of neuritis, but it should be employed in the treatment of such conditions under the direction of a physician. There are many types of neuritis not due to a deficiency of vitamin B_1, requiring other forms of treatment.

"When the diet is deficient in vitamin B_1, lack of appetite occurs, but there are many other causes of lack of appetite, such as infections, organic disorders, etc. However, vitamin B_1 does contribute to and is necessary for the maintenance of normal appetite.

"When their diet is deficient in vitamin B_1, the rate of growth of infants and children is retarded. Some investigators believe that lack of the vitamin plays a part in faulty elimination. When metabolism is increased, as occurs in feverish conditions, vigorous muscular activity, hyperthyroidism, etc., there are indications of greatly increased requirements for vitamin B_1.

"Although vitamin B_1 is widely distributed, it occurs in high concentration in only a few foods. There are grounds for believing that American diets as a whole have been un-
1945 satisfactory with respect to the content of vitamin B_1.

Yeast and wheat germ are the richest natural sources, but they are not commonly used as foods. However, whole grain cereals and flours, and the products made from them, are excellent sources as are such meats as pork, fresh ham and liver, and soy beans, green peas, nuts, egg yolk and lima beans. In the past, the refinement of various foods, has been responsible for a deficiency of vitamin B_1 in the diet of many individuals, but this difficulty is being overcome through the enrichment of such foods. (See section on 'Fortified' Foods.)

"*Vitamin B_2 (G) (Riboflavin).* After vitamin B_1 was discovered, the term vitamin B_2, or vitamin G, was used to desig-

nate what was left of the vitamin B complex. It was first believed that this vitamin was a single substance which was of value in the treatment of pellagra and it was popularly designated as the anti-pellagra vitamin. Later, vitamin B_2 (or G) was identified as riboflavin, a single chemical substance, and it was determined that another constituent of the vitamin B complex, nicotinic acid, was the pellagra-preventive factor.

"Vitamin B_2 or riboflavin has a wide distribution in living cells and is essential for normal nutrition. Among other things, deficiency of riboflavin is reported to result in the formation of various lesions around the corners of the mouth, on the tongue and ears, etc.

"Riboflavin is widely distributed. Yeast, meats, particularly the liver of beef, calf, lamb, mutton and pork are excellent sources. Whole cereals, milk, eggs, cheese and many green leafy and other vegetables, such as beans and peas, fruits, peanuts, and fish such as halibut, haddock, canned sardines and, particularly, mackerel, are all important sources.

1946 "*Nicotinic Acid.* The pellagra-preventive factor of the vitamin B complex has been identified as nicotinic acid, a substance which, incidentally, is not the same as the nicotine found in tobacco. Seemingly miraculous results have been obtained with nicotinic acid in the treatment of acute pellagra, a disease which has occurred widely in the South and is characterized by leathery, reddish skin, mouth and gum inflammation and progressively more serious symptoms including, in advanced cases, alimentary and mental disorders. Pellagra can be prevented by securing an adequate supply of nicotinic acid in the diet and is often cured quickly, by physicians, who inject nicotinic acid into the body. However, since most deficiencies are of a multiple nature, a diet rich in vitamin B_1, B_2 and B_6, is also frequently necessary in the treatment of this disease. Liver, lean meats, salmon, yeast, green vegetables, whole grains, tomato juice, eggs and milk are believed to be good food sources of nicotinic acid.

"*Vitamin C (ascorbic Acid).* Vitamin C is another of the vitamins which can be produced synthetically in pure chemical form. It is officially known as ascorbic acid.

"A deficiency of vitamin C results in the development of scurvy, a disease the notable symptoms of which are pain and a tendency to bleeding, as of the gums and capillary blood vessels. This disease may be avoided or entirely cured by the inclusion in the diet of foods which are rich in vitamin C. The term 'limey,' applied to British sailors, was derived from the Merchants Shipping Act of 1854 which provided that lime or lemon juice form a part of the stores of all ships likely to be

away from port more than ten days. The juice of citrus fruits is a rich source of vitamin C.

"Vitamin C is also one among other essential factors for the normal development and the maintenance of the bones
1947 and cartilages, the teeth and gums. Such symptomatic conditions as dental caries (cavities), lack of appetite, certain gum infections, and anemia may be concomitant signs of vitamin C deficiency or lack of assimilation of vitamin C.

"Vitamin C is wide-spread in practically all raw fruits and vegetables, particularly citrus fruits such as oranges, grapefruit and lemons. Properly canned fruits and vegetables, including fruit juices, retain a large share of their vitamin C, and may be an important source of this factor in the diet. The green leaves and shoots of plants such as are served in salads; such fresh fruits as apples, apricots, bananas, black currants, red raspberries, and strawberries; and many raw vegetables including brussels sprouts, cabbage, cauliflower and fresh-picked green peppers also generally supply a liberal porfion of this vitamin. Potatoes, when baked or boiled in skins, are another importanct source, particularly in view of the extent to which potatoes figure in the average diet. It is necessary that adequate amounts of this vitamin be secured daily since it is stored in the body only to a limited extent and a deficiency may result in injurious effects. In fever, the needs of the body for vitamin C are increased.

1948 "*Vitamin D.* Vitamin D is necessary for the proper utilization by the body of calcium and phosphorous. It is related to the development of bone and a deficiency causes rickets, a common disease of childhood, in which deformed bones manifest themselves as bow legs, knock-knees, swollen joints, distorted chests and spines, etc. A deficiency may also result in two other fearsomely named diseases, spasmophilia and osteomalacea. All of these conditions are manifestations of abnormal calcium and phosphorus metabolism which may result from a deficiency of vitamin D. The vitamin is essential not only in the prevention but in the treatment of these diseases.

"Vitamin D plays an important role in tooth formation and maintenance of normal tooth structure. However, adequate vitamin D intake will not, in itself, prevent dental caries or insure normal tooth structure. As in the case of the bone disorders previously referred to, vitamin D becomes of value only when an adequate supply of calcium and phosphorus are also present. The function of the vitamin is to regulate the utilization of these elements.

"Vitamin D has been produced in crystalline form and at least two forms of naturally-occurring vitamin D have been isolated. This vitamin is not present in any great amount in our common foods. The best food source is the liver of oil fish, such as halibut, tuna and cod. Canned salmon, sardines, and eggs and butter are regarded as good sources, while small amounts are present in liver, cream, milk and oysters. Most other foods have no vitamin D or only minute amounts. However, various foods such as milk, yeast, cereals, etc. may be 'fortified' with the vitamin by artificial means (See section on 'Fortified' Foods).

1949 "When the skin is exposed to the sun, vitamin D is formed in the body. The same result may be obtained through exposure to ultra-violet ray lamps which produce radiation similar to that of natural summer sunshine. It is believed that the body has the property of storing vitamin D so that exposure to sunlight when it is most potent, may exert a protective influence over a considerable portion of the year. However, existing conditions in certain localities, such as dust, smoke and moisture in the air, also indoor living, clothing, etc., reduce the effect of sunshine so that it may be difficult, particularly for infants, to obtain an adequate supply of vitamin D from the sun. It is well known that physicians commonly prescribe vitamin D preparations, or products rich in this vitamin, for babies and young children, particularly during the winter months.

"The need for vitamin D appears to be greater in infancy and childhood, in pregnancy and during the nursing period. The vitamin D requirements of adults, except those specified above, are not known at present.

"*Vitamin E.* Although it has been shown that an adequate supply of vitamin E is essential for normal reproduction in animals, very little is definitely known about the function of this vitamin in the human body. Attempts to produce a market for substances containing vitamin E among would-be parents through representations that the vitamin is capable of preventing sterility or promoting physical vigor have been banned by government agencies. One of the richest known sources of vitamin E is wheat germ oil (also seeds of legumes, muscle meats, egg yolk, milk and milk products, are good sources), but vitamin E is so widely distributed among so many common foods and so resistant to destructive action that, so far

1950 as is known, the necessary amount will accompany any ordinary diet. Accordingly, claims implying a need for special sources of vitamin E in the diet or recommendations for

use of a particular preparation because of its vitamin E content are, up to date, deprecated by authorities generally.

"*Vitamin F.* The term 'vitamin F' has been used to refer to at least three different substances but at the present time it has no scientific recognition. Attempts have been made to exploit 'vitamin F' as a term to designate certain essential fatty acids. However, practically all nutritionists refer to this dietary factor as the 'essential fatty acids.' Furthermore, no evidence has been found to satisfactorily establish that there is any lack of essential fatty acids in the average normal diet of either babies or older persons. Neither governmental agencies nor authorities on nutrition recognize the existence of any dietary factor under the name 'vitamin F.'

"*Vitamin K.* One of the latest vitamins to be discovered, vitamin K, is necessary for the formation of prothrombin, one of the substances which enables the blood to clot. Because it is widely distributed and occurs in a variety of foods, (for example, spinach, kale, tomatoes, oats sprouts) the average person need not worry about failure to secure an adequate supply of vitamin K if the diet is normal otherwise. In fact, deficiencies generally do not come from inadequate diet but from faulty absorption which occurs when there is not enough bile in the intestines. Vitamin K is useful primarily in surgery."

1951 18. Inadequate Diets and Nutritional Deficiencies in the United States, Bulletin No. 109 of the National Research Council (Nov. 1943).

"SUMMARY AND CONCLUSIONS:

"All the evidence from numerous surveys over the past ten years to the present among persons of all ages in many localities is without exception in complete agreement that inadequate diets are widespread in the nation. Although an appreciable percentage of the diets failing to meet the Council's recommended dietary allowances were more than 50 percent deficient in amounts of the several essential nutrients, most of the diets were less than 50 percent deficient. Accordingly, there is widespread prevalence of moderately deficient diets.

"It has long been recognized that other circumstances besides deficient diet impair nutrition. Certain so-called conditioning factors, such as physical exertion, light, trauma of several kinds, and disease, raise the requirements for essentials. Therefore, adequate intake is an individual matter related to the conditioning factors in operation. If these factors are sufficiently severe, even optimum intake may not completely protect

against their force during the period of maximum operation. It is evident that many factors affect nutritional status.

"But evidence that deficient diet or conditioning factors are in operation at some particular point of time gives only a slight and incomplete conception of the full scope of their influence and effects. The frequency and duration of their operation is extremely important. Thus time, which for persons is age, is a significant factor. Few people eat an adequate diet every day during their lifetime. Rather, there are numerous 1952 or protracted periods when the diet is faulty. Similarly, few people escape the operation of conditioning factors at frequent or lengthy periods in their life. The repeated or protracted operation of faulty diet or various conditioning factors slowly leads to cumulative effects in deficiency states.

"All the data from numerous surveys, with new methods among persons of all ages in many regions are entirely in accord in showing that deficiency states are rife throughout the nation. Relatively few are the traditional severe, acute, types. Most are milder in intensity and gradual in their course. Predominantly they are subacute or chronic states: some marked, but very many mild or moderate.

"From this evidence it is clear that there is both a preventive and corrective problem. On the preventive side, it is evident that production of sufficient food should be maintained and that more effective distribution of proper food is needed. For the latter, it would seem advisable to give further consideration to the program of judicious enrichment of appropriate foods since that would add much to the guarantee of successful nutrition. It is also evident that diet education must be intensified and extended to the utmost, and raised to new heights of effectiveness.

"On the corrective side, there is need for detection and therapeutic treatment of deficiency states among the population. For this project it is necessary to disseminate the new diagnostic methods among the medical and public health professions. Foremost among the steps in this direction would be: (1) preparation of a handbook on methods of detecting deficiency states; (2) establishment of training centers for instruction in the medical aspects of nutrition, especially diagnosis of the deficiency states; and (3) introduction of adequate courses on nutrition, particularly its clinical aspects, into medical schools."

1953

PLAINTIFF'S EXHIBIT 7

Title 21—Food and Drugs

Chapter I—Food and Drug Administration

[Docket No. FDC-24]

Part 2 Regulations for the Enforcement of the Federal Food, Drug, and Cosmetic Act

Amendment to General Regulations

By virtue of the authority vested in the Federal Security Administrator by provisions of the Federal Food, Drug, and Cosmetic Act [Sec. 701 (a), 52 Stat. 1055, 21 U. S. C., Sup. V, 371 (a)], the Reorganization Act of 1939 (53 Stat. 561 ff.; 5 U. S. C., Sup. V, 133 ff.), and Reorganization Plans No. I (53 Stat. 1423, 4 F. R. 2727) and No. IV (54 Stat., 5 F. R. 2421); the following general regulations under the Federal Food, Drug, and Cosmetic Act. [Sec. 403 (j), 52 Stat. 1048, 21 U. S. C. Sup. V, 343 (j)] are hereby promulgated:

§ 2.10a *General.* (a) The term "special dietary uses", as applied to food for man, means particular (as distinguished from general) uses of food, as follows:

(1) Uses for supplying particular dietary needs which exist by reason of a physical, physiological, pathological or other condition, including but not limited to the conditions of disease, convalescence, pregnancy, lactation, allergic hypersensitivity to food, underweight, and overweight;

(2) Uses for supplying particular dietary needs which exist by reason of age, including but not limited to the ages of infancy and childhood;

(3) Uses for supplementing or fortifying the ordinary or usual diet with any vitamin, mineral, or other dietary property. Any such particular use of a food is a special dietary use, regardless of whether such food also purports to be or is represented for general use.

(b) No provision of any regulation under section 403 (j) of the Act shall be construed as exempting any food from any other provision of the Act or regulations thereunder, including sections 403 (a) and (g) and, when applicable, the provisions of Chapter V. (Sec. 403 (j), 52 Stat. 1048; 21 U. S. C., Supp., 343 (j)).

WATSON B. MILLER,
Acting Administrator.

November 18, 1941.

[F. R. Doc. 41-8702; Filed, November 21, 1941; 11:48 a. m.]

[Docket No. FDC-24]

Part 125—Label Statements Concerning Dietary Properties of Food Purporting To Be or Represented for Special Dietary Uses

Findings of Fact and Regulations

By virtue of the authority vested in the Federal Security Administrator by provisions of the Federal Food, Drug, and Cosmetic Act [Sec. 403 (j), 52 Stat. 1048, 21 U. S. C., Sup. V, 343 (j); Sec. 701 (e), 52 Stat. 1055, 21 U. S. C., Sup. V, 371 (e)], the Reorganization Act of 1939 (53 Stat. 561 ff.; 5 U. S. C., Sup. V, 133 ff.), and Reorganization Plans No. I (53 Stat. 1423, 4 F. R. 2727) and No. IV (54 Stat., 5 F. R. 2421); and upon the basis of evidence of record at the above entitled hearing duly held pursuant to notice thereof issued by the Administrator on August 31, 1940 (5 F. R. 3565), the following order is hereby promulgated:

Findings of Fact

1. The value of a food for any special dietary use is determined by its dietary properties, such as the presence or absence of a substance or the quantity or altered character of a constituent.

2. Information necessary in order to inform the purchaser of the value of a food for a special dietary use includes a statement of the dietary properties upon which its value for such use is based.

3. Among other dietary properties of food, certain vitamins and minerals are known to be essential to the normal functioning of the human organism; the quantity of any vitamin or mineral required is customarily expressed in terms of the quantity required each day and is referred to as the daily requirement.

4. Deficiency in the intake of any essential vitamin, mineral, or other dietary property produces pathological conditions known as a deficiency disease, whereas, intake of a certain minimum quantity of such substance prevents the onset of such conditions.

5. The value of a food for special dietary use may depend on its suitability for the treatment of a deficiency disease.

6. The quantity of a vitamin, mineral, or other dietary property necessary to prevent a deficiency disease is usually less than the quantity necessary for the effective treatment of that disease.

7. The quantity and the duration of administration of such a property for the correction of such disease may differ under different conditions.

8. Purchasers in general are unaware of the quantities of dietary constituents or the duration of their consumption necessary for the effective treatment of deficiency diseases.

1954

9. Information required by the purchaser to evaluate a food for the correction of deficiency diseases includes adequate directions for use.

10. The value of a food for special dietary use may depend on its content of one or more of the vitamins A (or precursors thereof), B_1, C, D, riboflavin, nicotinic acid or nicotinic acid amide, and some other vitamins.

11. The terms "vitamin B_1" and "thiamine", the terms "vitamin C" and "ascorbic acid", and the terms "riboflavin", "vitamin B_2" and "vitamin C", are synonymous.

12. Deficiency in the intake of vitamin A produces the pathological conditions known as nutritional night blindness and as xerophthalmia.

13. Vitamin A exists as such in certain animal tissues and is produced by the animal organism from precursors of vitamin A, which include the vegetable pigments alpha carotene, beta carotene, gamma carotene, and cryptoxanthin.

14. The vitamin A activity of food is determined by biological assay; an equal weight of vitamin A and of each of its known precursors, when reacted upon by the animal organism, do not all have the same degree of activity; none of such precursors has as high a degree of activity as vitamin A.

15. It is necessary, in order fully to inform the purchaser of the value of the precursors of vitamin A for special dietary use, that their activity be measured and stated as vitamin A, but that any such precursor sold as such be designated by its common or usual name and not as vitamin A.

16. Deficiency in the intake of vitamin B_1 produces the pathological condition known as beriberi.

17. Deficiency in the intake of vitamin C produces the pathological condition known as scurvy.

18. Deficiency in the intake of vitamin D produces the pathological conditions known as rickets and osteoporosis.

19. Deficiency in the intake of riboflavin produces the pathological condition known as ariboflavinosis.

20. The value of a food for special dietary use may depend on its content of one or more of the mineral elements calcium, phosphorus, iron, iodine, and possibly other mineral elements.

21. Deficiency in the intake of calcium or phosphorus produces the pathological conditions known as rickets and osteoporosis.

22. Deficiency in the intake of iron results in the pathological condition known as nutritional anemia.

23. Deficiency in the intake of iodine results in the pathological condition known as simple goiter.

24. The minimum daily requirements for such vitamins and minerals in the human diet are the quantities necessary for the prevention of such deficiency diseases.

25. The requirements of different persons for most of the essential vitamins bear a relationship to body weight which in turn bears a relationship to age groups. Thus, for nutritional purposes, with respect to these and many other dietary factors, persons are commonly classed as infants (persons under one year of age), children (persons one or more but less than 12 years of age), and adults (persons 12 or more years of age), children may be further classified as the groups less than six, and six or more years of age, when nutritional requirements bear an unusually close relationship to body weight.

26. The nutritional requirements for vitamins A, B_1, C, and riboflavin are so correlated with age, but the requirements for vitamin D and minerals are not.

27. Purchasers generally do not know the quantity of vitamins and minerals needed to supply their minimum daily requirements.

28. Information necessary for the purchaser to evaluate a food for special dietary use based on its vitamin or mineral property for which the minimum daily requirement has been established is a statement of the proportion of the minimum daily requirement for such vitamin or mineral supplied by a specified quantity of such food.

29. To be reasonably useful to the purchaser, the quantity so specified must be the quantity of the food customarily or usually consumed during a period of one day, or a quantity reasonably suitable for or practicable of consumption during a period of one day.

30. The quantity of vitamin A in a food is expressed as the biologically measured activity of vitamin A and its precursors in terms of United States Pharmacopoeia units (commonly referred to as U. S. P. units).

31. The quantity of vitamin B_1 in a food is expressed by weight in terms of the metric system or by United States Pharmacopoeia units (commonly referred to as U. S. P. units).

32. The quantity of vitamin C in a food is expressed by weight in terms of the metric system or by United States Pharmacopoeia units (commonly referred to as U. S. P. units).

33. The quantity of vitamin D in a food is expressed in terms of United States Pharmacopoeia units (commonly referred to as U. S. P. units).

34. The quantity of riboflavin in a food is expressed by weight in terms of the metric system.

35. The quantities of calcium, phosphorus, iron, and iodine in foods are commonly expressed by weight in terms of the metric system.

36. Because of variations in body weight and other factors, the minimum daily requirements of individuals for vitamins vary, even among persons in the same age groups; but in the cases of vitamins A, B_1, C, D, and riboflavin the variation within any age group is of such narrow range that a minimum daily requirement for any such vitamin can be prescribed for different age groups, and the ingestion of the quantity so prescribed will prevent any clinically significant manifestation of the deficiency disease characteristic of deficiency of such vitamin.

37. The minimum daily requirement for vitamin A is as follows:

For infants, 1,500 U. S. P. units.

For children more than 1 but less than 12 years of age, 3,600 U. S. P. units.

For any person 12 or more years of age, 4,000 U. S. P. units.

38. The minimum daily requirement for vitamin B_1 is as follows:

For infants, 0.25 mg. (83 U. S. P. units).

For children more than 1 but less than 6 years, 0.5 mg. (167 U. S. P. units).

For children 6 or more but less than 12 years old, 0.75 mg. (250 U. S. P. units).

For a person 12 or more years old, 1 mg. (333 U. S. P. units).

39. The minimum daily requirement for vitamin C is as follows:

For infants, 10 mg. (200 U. S. P. units).

For children more than 1 but less than 12 years old, 20 mg. (400 U. S. P. units).

For a person 12 or more years old, 30 mg. (600 U. S. P. units).

40. The minimum daily requirement for vitamin D is 400 units for any person, irrespective of age, except as hereinafter noted in respect of vitamin D contained in cows' milk and evaporated milk.

41. The minimum daily requirement for riboflavin is as follows:

For an infant, 0.5 mg.

For a person 12 or more years old, 2.0 mg.

42. The minimum daily requirement for riboflavin for children one year or more but less than 12 years of age has not been established.

43. A given quantity of vitamin D consumed in cows' milk or evaporated milk is more efficacious in the prevention of rickets than the same quantity of vitamin D consumed in other carriers, but the minimum daily requirement of vitamin D when consumed in cows' milk or evaporated milk has not been established.

44. Cows' milk containing 135 units of vitamin D per quart, and evaporated milk containing 7.5 U. S. P. units of vitamin D per avoirdupois ounce, usually will prevent clinical rickets when fed to normal infants in customary quantities.

45. Cows' milk and evaporated milk with increased vitamin D content are customarily marketed at two levels of vitamin D content, 400 U. S. P. units and 135 U. S. P. units per quart in the case of milk, and 22.2 U. S. P. units and 7.5 U. S. P. units per avoirdupois ounce in the case of evaporated milk.

46. In the absence of established fact as to the minimum daily requirement for vitamin D carried in cows' milk and evaporated milk, information essential to the purchaser concerning the value of such milk and evaporated milk for special dietary use based on its vitamin D content includes at least a statement of the number of
1955 U. S. P. units of vitamin D in a specified quantity of such milk or evaporated milk.

47. The prevalence of rickets among infants and children is such that information essential to purchasers concerning the value of cows' milk for special dietary use based on a vitamin D content increased to less than 135 U. S. P. units per quart, includes at least the statement that additional vitamin D should be supplied from other sources.

48. Because of variations in body weight, in the quantity of food ingested, and in other factors, it is impracticable to establish minimum daily requirements applicable to the needs of infants generally for calcium, phosphorus, iron, and iodine.

49. Because of variations in the body weight and other factors, individuals other than infants have varying minimum daily requirements for minerals. In the cases of calcium, phosphorus, iron, and iodine, the variation is of such narrow range that a minimum daily requirement for any such mineral can be prescribed, and the ingestion of the quantity so prescribed will prevent any clinically significant manifestation of the deficiency disease characteristic of a deficiency of such mineral, except as specified in Finding 50 with respect to pregnant and lactating women.

50. During pregnancy and lactation the requirements of women for calcium, phosphorus, and iron are increased.

51. The minimum daily requirement for calcium and for phosphorus is 750 milligrams for any person more than one year of age, except any pregnant or lactating woman for whom 1.5 grams is the minimum daily requirement.

52. The minimum daily requirement for iron is 7.5 milligrams for a child more than one but less than six years of age, 10 milligrams for a person six or more years of age, except any pregnant or lactating woman for whom 15 milligrams is the minimum daily requirement.

53. The minimum daily requirement for iodine is 0.1 milligram for any person more than one year of age.

54. In order fully to inform purchasers of the value of a food purporting to be or represented for special dietary use by pregnant or lactating women based in whole or in part on its mineral property in respect of calcium, phosphorus, or iron, a statement of the proportion of the minimum daily requirement furnished thereby must include the proportion for such women.

55. Simple goiter is endemic to certain geographical areas in the United States, because of the inadequacy of the iodine content of the water and other foods in those areas.

56. Federal and state public health authorities seek to encourage and increase the consumption of iodine in those areas.

57. As a means of supplying adequate quantities of iodine to the diet in those areas, such authorities have induced the manufacturers of salt, inasmuch as salt is common to all adequate diets, to produce iodized salt by the addition to salt of 0.023 percent by weight of potassium iodide, equivalent to 0.0176 percent iodine.

58. The distribution of iodized salt has resulted in a great decrease in the incidence of simple goiter in those areas.

59. Under the program so agreed upon between health authorities and salt manufacturers, the quantity of iodine in the usual daily intake of iodized salt is approximately 10 times the minimum daily requirement for iodine of persons other than infants.

60. The statement on the label of iodized salt that the usual daily intake thereof contains 10 times the minimum daily requirement for iodine would be reasonably calculated to result in a decrease in the consumption of iodized salt, even in those areas where goiter is endemic, and thus cause an increase in the incidence of simple goiter.

61. It is the established practice of manufacturers of iodized salt to declare on the label the percent by weight of potassium iodide in the iodized salt.

62. Purchasers of iodized salt are adequately informed of its value in the prevention of simple goiter by the declaration on the label of the percent by weight of potassium iodide present therein.

63. In the consumption of vitamins and minerals it is desirable to have a safety factor above the minimum daily requirements, and fractional proportions of requirements above the minimum daily requirements for vitamins and minerals may be regarded as such a safety factor.

64. Such fractions may be disregarded in label statements without depriving the purchaser of essential information.

65. The dietary requirements of age groups other than adults are usually estimated by reference to adult intakes as a standard.

66. A statement of the proportion of the minimum daily requirements of adults for vitamins and minerals suffices to furnish full

information as to such requirements for persons generally; but, where the food is for the use of a specific age group or groups, full information as to its value for such use includes a statement of the proportion of the minimum daily requirement for such vitamin or mineral for such age group or groups.

67. A food may have special dietary use by reason of its content of some vitamins other than A, B_1, C, D, or riboflavin, or some minerals other than calcium, phosphorus, iron, or iodine. The minimum daily requirements and, in some cases, the need in human nutrition for such other substances have not been established by the opinion of experts qualified by scientific training and experience to determine such facts; but in the cases of some such other substances there is substantial, though inconclusive, support in the opinions of such experts of a determination of one or both of such facts.

68. When the need for such a substance has not been so established, information necessary fully to inform the purchaser of the value for special dietary use of a food containing it includes a statement that the need for such substance has not been established.

69. When the need for a vitamin or mineral has been so established, it is frequently still unknown what is the minimum daily requirement therefor.

70. When the minimum daily requirement for such a substance has not been established, whether or not evidence of human need therefor is conclusive, purchasers must rely on the best available scientific information or professional advice; and in order to evaluate such food in terms of such information or advice, it is necessary that the purchaser be informed of the quantity of the vitamin or mineral present in a specified quantity of such food suitable for daily consumption.

71. The quantity of such a vitamin or mineral necessary to prevent a disease resulting from a dietary deficiency of such substance, is usually unrelated to the quantity necessary for use in treating the disease; when such a vitamin or mineral purports to be or is represented for use in treating such a disease, in addition to adequate directions for use, a statement of the quantity of the substance present in a specified quantity of the food is information necessary for the purchaser to evaluate the food for such use in terms of the best available scientific information or professional advice.

72. The value of a food for special dietary use may depend on its suitability as a food for infants.

73. The diet of infants is more restricted than that of normal persons of other age groups and the suitability of a food for infant use depends on its ingredients or character.

74. Information necessary fully to inform the purchaser of the value of a food for such use includes the common or usual name of each ingredient thereof.

75. Infants are more susceptible to allergies resulting from plant or animal substances than persons of other age groups.

76. Information concerning the source of a food of plant or animal origin for use by infants is necessary properly to evaluate its suitability for use by particular infants.

77. The value of an infant food may depend upon its simulation of, or suitability as a complete or partial substitute for, human milk.

78. Normal human milk contains adequate quantities of all the factors essential to infant nutrition, except that its content of vitamin C, vitamin D, and iron is insufficient in many cases to prevent scurvy, rickets, and nutritional anemia, respectively.

79. The value of a food as a complete or partial substitute for human milk in infant feeding depends on its content of such factors as moisture, protein, fat, carbohydrates, crude fiber, calcium, phosphorus, iron, and vitamins A, B_1, C, and D, and the calories supplied by such food.

1956

80. Information necessary to evaluate a food as a complete or partial substitute for human milk in infant feeding includes a statement of the percent by weight of moisture, protein, fat, available carbohydrates, crude fiber, calcium, phosphorus, and iron, a statement of the number of available calories, and a statement of the number of units of vitamin A, vitamin B_1, vitamin C, and vitamin D supplied by the food.

81. The most common dietary deficiency diseases in infants are scurvy, rickets, and nutritional anemia, caused respectively by deficiencies of vitamin C, vitamin D, and iron in human milk or in preparations used as substitutes for human milk, including, among others, cows' milk and evaporated milk in which the quantities of such substances have not been increased.

82. Many purchasers are unaware of the deficiencies in these respects of such substitutes.

83. Such substitutes are customarily diluted and mixed with a soluble carbohydrate for infant feeding. In the proportions usually recommended by pediatricians each 100 calories of the mixed substitute must contain 30 U. S. P. units of vitamin C, 50 U. S. P. units of vitamin D, and 0.75 milligram of iron to supply the minimum daily requirements of infants for such substances.

84. Where a food for use as a complete or partial substitute for human milk in infant feeding contains less than such quantities of vitamin C, vitamin D, or iron, information necessary for the purchaser to determine the value of the food includes a statement that such factors must be supplemented from other sources.

85. The value of cows' milk and evaporated milk used as a complete or partial substitute for human milk in infant feeding is sufficiently well known that, aside from their deficiency in vitamin C, iron, and vitamin D when the quantity of vitamin D has not been adequately increased, a statement relative to their constituents is not necessary to inform the purchaser of their value for such use.

86. 135 U. S. P. units of vitamin D per quart of cows' milk and 7.5 U. S. P. units per avoirdupois ounce of evaporated milk, the equivalent of 135 units per quart of milk when the evaporated milk is reconstituted by the addition of water, being usually sufficient, when fed in customary quantities, for the prevention of clinical rickets in normal infants due to its greater efficacy in milk, a statement that vitamin D must be supplied from other sources is not necessary when the milk or evaporated milk contains such quantities of vitamin D.

87. The value of a food for special dietary use may depend on its suitability for use in the control of body weight through regulating the intake of protein, fat, carbohydrates, or calories.

88. The quantity and relative proportions of protein, fat, and carbohydrates, and the number of calories consumed, are important factors in the regulation of body weight.

89. The value of a food for special dietary use may depend on its suitability for use in dietary management with respect to disease through regulating the intake of protein, fat, carbohydrates, or calories; such management is an important factor in the treatment of many diseases.

90. Some carbohydrate substances are not digested or assimilated by the human organism and supply no food energy. Only the carbohydrates which may be digested and assimilated are available to the metabolic processes of the organism.

91. Carbohydrates which are non-available to the metabolic processes have a theoretical caloric value but supply no calories to the human organism.

92. Information necessary for the purchaser to evaluate a food for use in the control of body weight, or in dietary management with respect to disease, includes a statement on the label of the percent by weight of protein, fat, and available carbohydrates in such food and a statement on the label of the number of available calories supplied by a specified quantity of the food.

93. The value of a food for special dietary use may depend on the presence therein of a constituent which is not utilized in normal metabolism and which consequently has no nutritive value.

94. Its use may be for the reduction of caloric intake, as in the case of mineral oil; for the promotion of laxation, as in the case of fibrous plant matter; or for the satisfaction of taste desires without increasing food value, as in the case of saccharin.

95. Information necessary to inform the purchaser of the value of a food for special dietary use by reason of its content of such a constituent includes a statement of the percent by weight of the constituent in the food, preceded or followed by the word "nonnutritive," except as hereinafter noted in Finding 98 with respect to saccharin.

96. If such constituent is fibrous plant matter it is commonly determined as and expressed as crude fiber.

97. Saccharin, alone or in combination in a saccharin salt, is a nonnutritive, synthetic sweetening substance sometimes used to satisfy the psychological desire for sweets in the diets of persons who must restrict their intake of carbohydrates. It has not other use as a food and is not utilized in normal metabolism.

98. Information necessary to inform the purchaser of the value of a food for special dietary use by reason of its saccharin content is a statement that it contains a specified percent by weight of saccharin, a nonnutritive, artificial sweetener which should be used only by persons who must restrict their intake of ordinary sweets.

99. The value of a food for special dietary use may depend on its hypoallergenic property; that is, the absence or, or greatly reduced quantity of; a substance which causes allergic reaction.

100. Allergic effects are abnormal, toxic tissue disturbances and may be produced by any food constituent.

101. Decrease of an allergenic constituent may be accomplished by treatment or processing of the constituent.

102. When a food or ingredient is a plant or animal substance the allergenic property thereof is usually based on a specific factor, most frequently a protein, derivable only from the plant or animal which is its source.

103. Persons subject to gastrointestinal allergic effects can avoid them only by elimination of the allergenic substances from their diets or by such a reduction thereof that the quantity is insufficient to produce the toxic disturbances, and in some cases by hyposensitization measures.

104. Information necessary to inform the purchaser of the value of a food for hypoallergenic use includes the following: The common or usual name and the quantity or proportion of each ingredient, in case it is fabricated from two or more ingredients; a qualification of the name of the food, in case it consists of a single ingredient, or of the name of each ingredient, in case it is fabricated from two or more ingredients, to reveal the specific plant or animal which is the source of such food or such ingredient, if such food or such ingredient consists in whole or in part of plant or animal matter and such name does not clearly reveal the specific plant or

animal which is such source; a statement indicating the nature and effect of any treatment or processing, if the changed allergenic property results from such treatment or processing.

On the basis of the foregoing detailed findings of fact it is found and determined that the label of a food which purports to be or is represented for special dietary uses by man should bear the information concerning the vitamin, mineral, and other dietary properties of such food prescribed in the regulations hereinafter set forth, and that such information concerning such properties of such food is necessary in order fully to inform purchasers as to its value for such uses.

It is therefore, ordered, That the following regulations be and they hereby are promulgated:

Regulations

Sec.

125.01 Definitions and interpretations of terms.
125.02 General label statements.
125.03 Label statements relating to vitamins.
125.04 Label statements relating to minerals.
125.05 Label statements relating to infant food.
1957 125.06 Label statements relating to certain food used in control of body weight or in dietary management with respect to diseases.
125.07 Label statements relating to nonnutritive constituents.
125.08 Label statements relating to hypoallergenic food.

§ 125.01 *Definitions and interpretations of terms.* (a) The definitions and interpretations of terms contained in section 201 of the Act shall be applicable also to such terms when used in these regulations.

(b) Any requirement of the regulations in this part with respect to the quantity of vitamin A means the biologically measured activity of vitamin A and its precursors; but if any such precusor is sold as such or is added to a food the label shall designate such precursor by its common or usual name and not as vitamin A.

(c) Specification in the regulations in this part of a quantity of any vitamin, mineral, or other dietary property as a minimum daily requirement shall not be construed as a determination that such quantity is sufficient for the treatment of any disease resulting from a deficiency in such vitamin, mineral, or other property.

(d) For the purposes of the regulations in this part, the terms "infant," "child," and "adult" mean persons not more than 12

months old, more than 12 months but less than 12 years old, and 12 years or more old, respectively.

§§ 125.01 to 125.08, inclusive, issued under the authority contained in secs. 403 (j), 701 (e), 52 Stat. 1048, 1055, 53 Stat. 561; 21 U.S.C., Sup. 343 (j), 371 (e), 5 U.S.C., Sup., 133-133t, and Reorganization plans I, IV, 53 Stat. 1423, 54 Stat. 1234; 4 F.R. 2727, 5 F.R. 2421.

§ 125.02 *General label statements.* (a) If a food (including food to which any one or more of §§ 125.03 to 125.08, inclusive, of the regulations in this part is applicable) purports to be or is represented for any special dietary use by man, its label shall bear a statement of the dietary properties upon which such use is based in whole or in part. Such statement shall show the presence or absence of any substance, any alteration of the quantity or character of any constituent, and any other dietary property of such food upon which such use is so based.

(b) If a food (including food to which any one or more of §§ 125.03 to 125.08, inclusive, of the regulations in this part is applicable) purports to be or is represented for special dietary use by reason of its use for treating any disease resulting from a dietary deficiency in man, its label shall bear, in addition to the information required under paragraph (a) hereof, adequate directions for such use.

§ 125.03 *Label statements relating to vitamins.* (a) (1) If a food purports to be or is represented for special dietary use by man by reason of its vitamin property in respect of—

Vitamin A or its precursors,
Vitamin B_1 (thiamine),
Vitamine C (ascorbic acid),
Vitamin D, or
Riboflavin (vitamin B_2, vitamin G),

the label (except as hereinafter provided with respect to cows' milk and evaporated milk, and unless the exemption under subparagraph (4) of this paragraph applies) shall bear a statement of the proportion of the minimum daily requirement for such vitamin supplied by such food when consumed in a specified quantity during a period of one day. If such purported or represented special dietary use is for persons within two or more age groups for which minimum daily requirements are set forth in paragraph (b), such statement shall include such proportion for each such group; but if such use is for persons irrespective of age groups, such statement may be limited to the proportion of the minimum daily requirement set forth in paragraph (b) for an adult. The quantity specified as above re-

quired shall be the quantity customarily or usually consumed during a period of one day, or a quantity reasonably suitable for and practicable of consumption within such period. When such proportion is a whole number and a fraction it may be expressed as the whole number and the fraction may be disregarded. The foregoing requirements of this paragraph shall not apply to cows' milk and evaporated milk which purport to be or are represented for special dietary use by reason of their content of vitamin D; but in the case of cows' milk in which the vitamin D content has been increased by any means, and in the case of evaporated milk with increased vitamin D content as prescribed in the definition and standard of identity for evaporated milk (§ 18.520), the label shall bear a statement of the number of U. S. P. units in a specified quantity of such milk or evaporated milk. In the case of cows' milk in which the vitamin D content is increased to less than 135 U. S. P. units to each quart, the label shall also bear a statement that additional vitamin D should be supplied from other sources.

(2) If a food purports to be or is represented for special dietary use by man by reason of its vitamin property in respect of any vitamin not listed in subparagraph (1) of this paragraph, the label shall bear a statement of the quantity of such vitamin in a specified quantity of such food. The quantity of food specified as required herein shall be the quantity customarily or usually consumed during a period of one day, or a quantity reasonably suitable for and practicable of consumption within such period. If the need in human nutrition for such vitamin has not been established, the label shall also bear the statement "The need for ..... in human nutrition has not been established," the blank to be filled in with the name of such vitamin.

(3) If a food purports to be or is represented for special dietary use by man by reason of its vitamin property, and any such use is for treating any disease resulting from a dietary deficiency of any vitamin, the label shall bear a statement of the quantity of such vitamin in a specified quantity of such food. If the represented special dietary use of such food is solely for treating any such disease, such food shall be exempt from the labeling requirements of subparagraphs (1) and (2) of this paragraph when otherwise applicable.

(4) Compliance with the provisions of subparagraphs (2) and (3) of this paragraph shall not be construed as relieving any food which purports to be or is represented for special dietary use by reason of its vitamin property from the application of sections 403 (a) and 201 (n) of the Act, as in the case where the need for such vitamin in human nutrition is not substantially supported by the opinion of experts qualified by scientific training and experience to determine such needs.

(b) For the purposes of the regulations in this section the following are minimum daily requirements:

(1) For vitamin A, 1,500 U. S. P. units for an infant, 3,000 U. S. P. units for a child, 4,000 U. S. P. units for an adult.

(2) For vitamin B_1 (thiamine), 0.25 milligram (83 U. S. P. units) for an infant, 0.5 milligram (167 U. S. P. units) for a child less than six years old, 0.75 milligram (250 U. S. P. units), for a child six or more years old, 1 milligram (333 U. S. P. units) for an adult.

(3) For vitamin C (ascorbic acid), 10 milligrams (200 U. S. P. units) for an infant, 20 milligrams (400 U. S. P. units) for a child, 30 milligrams (600 U. S. P. units) for an adult.

(4) For vitamin D, 400 U. S. P. units for an infant, child, or adult.

(5) For riboflavin (vitamin B_2, vitamin G), 0.5 milligram for an infant, 2.0 milligrams for an adult.

§ 125.04 *Label statements relating to minerals.* (a) (1) If a food purports to be or is represented for special dietary use by man by reason of its mineral property in respect of—

Calcium,
Phosphorus,
Iron, or
Iodine,

the label (except as hereinafter provided with respect to iodized salt, and unless the exemption under subparagraph (4) of this paragraph applies) shall bear a statement of the proportion of the minimum daily requirement for such element supplied by such food when consumed in a specified quantity during a period of one day. If such purported or represented special dietary use is for persons within two or more age groups or other groups having special dietary requirements, for which minimum daily requirements are set forth in paragraph (b), such statement shall include such proportion for each such group; but if such use is for persons irrespective of such groups, such statement may be limited to the proportion of
1958 minimum daily requirement set forth in paragraph (b) for an adult other than a pregnant or lactating woman. The quantity specified as above required shall be the quantity customarily or usually consumed during a period of one day, or a quantity reasonably suitable for and practicable of consumption within such period. When such proportion is a whole number and a fraction it may be expressed as the whole number and the fraction may be disregarded. The foregoing requirements of this paragraph shall not apply to iodized salt which purports to be or is represented for special dietary use by reason of its iodine content, if the label bears a statement of the quantity or proportion of iodine, or salt thereof, in the iodized salt and the quantity of iodine present therein is not more than 0.2 percent by weight.

(2) If a food purports to be or is represented for special dietary use by man by reason of its mineral property in respect of any element not listed in subparagraph (1) of this paragraph, the label shall bear a statement of the quantity of such element in a specified quantity of such food. The quantity of food specified as required herein shall be the quantity customarily or usually consumed during a period of one day, or a quantity reasonably suitable for and practicable of consumption within such period. If the need in human nutrition for such element has not been established, the label shall also bear the statement "The need for ..... in human nutrition has not been established," the blank to be filled in with the name of such element.

(3) If a food purports to be or is represented for special dietary use by man by reason of its mineral property, and any such use is for treating any disease resulting from a dietary deficiency of any element, the label shall bear a statement of the quantity of such element in a specified quantity of such food. If the represented special dietary use of such food is solely for treating any such disease, such food shall be exempt from the labeling requirements of subparagraphs (1) and (2) of this paragraph when otherwise applicable.

(4) Compliance with the provisions of subparagraphs (2) and (3) of this paragraph shall not be construed as relieving any food which purports to be or is represented for special dietary use by reason of its mineral property from the application of §§ 403 (a) and 201 (n) of the Act, as in the case where the need for such element in human nutrition is not substantially supported by the opinion of experts qualified by scientific training and experience to determine such needs.

(b) For the purposes of the regulations in this section, the following are minimum daily requirements:

(1) For calcium (Ca), 750 milligrams for a child or an adult, except a pregnant or lactating woman in which case the minimum daily requirement is 1.5 grams.

(2) For phosphorus (P), 750 milligrams for a child or an adult, except a pregnant or lactating woman in which case the minimum daily requirement is 1.5 grams.

(3) For iron (Fe), 7.5 milligrams for a child less than six years old, 10 milligrams for a child six or more years old or for an adult, except a pregnant or lactating woman in which case the minimum daily requirement is 15 milligrams.

(4) For iodine (I), 0.1 milligram for a child or an adult."

§125.05 *Label statements relating to infant food.* If a food which purports to be or is represented for special dietary use is a food for infants, the label shall bear, in case such food is fabricated from two or more ingredients, the common or usual name of each such in-

gredient including spice, flavoring, and coloring; if such food, or any ingredient thereof in case it is fabricated from two or more ingredients, consists in whole or in part of plant or animal matter and the name of such food or ingredient does not clearly reveal the specific plant or animal which is its source, such name shall be so qualified as to reveal clearly the specific plant or animal which is such source. If such use of the food is by reason of its simulation of human milk or its suitability as a complete or partial substitute for human milk, the label shall also bear,

(a) a statement of the percent by weight of moisture, protein, fat, available carbohydrate, crude fiber, calcium (Ca), phosphorus (P), and iron (Fe) contained in such food;

(b) a statement of the number of available calories and of U.S.P. units of vitamin A, vitamin B_1, (thiamine), vitamin C (ascorbic acid), and vitamin D supplied by a specified quantity of such food; and

(c) If less than 30 U.S.P. units of vitamin C (ascorbic acid), less than 50 U.S.P. units of vitamin D, or less than 0.75 milligram of iron (Fe), is supplied by the quantity of such food which, as customarily or usually prepared for consumption, supplies 100 available calories, a statement that additional quantities of such vitamin or iron, as the case may be, should be supplied from other sources.

The provisions of paragraphs (a) and (b) of this section shall not apply to cows' milk and evaporated milk. The provisions of paragraph (c) of this section with respect to vitamin D shall not apply to cows' milk or evaporated milk in which the vitamin D is increased by any means to not less than 135 U.S.P. units to each quart in the case of cows' milk and not less than 7.5 U.S.P. units to each avoirdupois ounce in the case of evaporated milk."

§125.06 *Label statements relating to certain food used in control of body weight or in dietary management with respect to disease.* If a food purports to be or is represented for special dietary use by man by reason of its use as a means of regulating the intake of protein, fat, carbohydrate, or calories, for the purpose of controlling body weight, or for the purpose of dietary management with respect to disease, the label shall bear a statement of—

(a) the percent by weight of protein, fat, and available carbohydrates in such food; and

(b) the number of available calories supplied by a specified quantity of such food."

§125.07 *Label statements relating to nonnutritive constituents.* If a food purports to be or is represented for special dietary use by man by reason of the presence of any constituent which is not utilized in normal metabolism, the label shall bear a statement of the percent by weight of such constituent, and, in juxtaposition with the name of such constituent, the word "nonnutritive". If such constituent is

fibrous plant matter, it shall be considered to be crude fiber and its percent expressed as such. But if such constituent is saccharin or a saccharin salt, the label shall bear, in lieu of such statement and word, the statement "Contains .... saccharin (or saccharin salt, as the case may be), a nonnutritive, artificial sweetener which should be used only by persons who must restrict their intake of ordinary sweets", the blank to be filled in with the percent by weight of saccharin or saccharin salt in such food. The provisions of this section shall not be construed as authorizing the use of saccharin or its salts in any food other than one for use by persons who must restrict their intake of carbohydrates, or as relieving any food from compliance with any requirement of sections 402 (b) or (d), 403 (g), or other provisions of the Act."

§ 125.08 *Label statements relating to hypoallergenic food.* If a food purports to be or is represented for special dietary use by man by reason of the decrease or absence of any allergenic property, the label shall bear

(a) the common or usual name and the quantity or proportion of each ingredient including spices, flavoring, and coloring in case the food is fabricated from two or more ingredients;

(b) a qualification of the name of the food, or of the name of each ingredient thereof in case the food is fabricated from two or more ingredients, to reveal clearly the specific plant or animal which is the source of such food or of such ingredient, if such food or such ingredient consists in whole or in part of plant or animal matter and such name does not clearly reveal the specific plant or animal which is such source; and

(c) a statement indicating the nature and effect of any treatment or processing of the food or any ingredient thereof, if the changed allergenic property results from such treatment or processing."

These regulations shall be effective from and after the 180th day from this day.

WATSON B. MILLER,
Acting Administrator.

NOVEMBER 18, 1941.

1959 PLAINTIFF'S EXHIBIT 9

In reply refer to 82-031/33 H, 82-036 H, Drugs.

Federal Security Agency
FOOD AND DRUG ADMINISTRATION
Los Angeles Station

NOTICE OF HEARING

June 18, 1947

Mytinger & Casselberry
194 Park Avenue
Long Beach, California

Investigation by this Administration indicates that violation of the Federal Food, Drug, and Cosmetic Act has occurred, as shown in the attached charges, with respect to the following:

See Attached Sheet.

The facts in our possession indicate your responsibility for the violation. An opportunity will be given you on Thursday, June 26, 1947, at 2:00 P.M., in Room 514, California Medical Building, 1401 South Hope Street, Los Angeles 15, California. *(Hearing postponed to 7-14-47.)*

to present informally your views with respect to the charges before a decision is reached as to whether the matter should be referred to the Department of Justice for prosecution. You may appear in person or by attorney, or you may submit your response to this notice in the form of a letter in lieu of personal appearance. If written response is made, please submit your letter and all accompanying documents in quadruplicate. Documents submitted at personal appearance should be in quadruplicate. If no response is received on or before the date of the hearing, the matter will be decided on the evidence at hand.

By direction of the Administrator of the Federal Security Agency:

(S.) R. B. BORN,
Asst. Chief of Station.

Enclosures: Legal Status Form; Charge Sheet.

1960 OBJECT OF THE HEARING

Before any violation of the act is reported by the Administrator for the institution of a criminal proceeding the party or parties who appear to be responsible, are through this notice, given the opportunity to explain *voluntarily* any incidents connected with the preparation or handling of the shipment mentioned which would indicate that prosecution should not follow for the violation specified in the charge sheet attached. *If the shipment has been seized such action does not preclude prosecution of those responsible for the violation; the hearing concerns the possible criminal action and not the action involving the seizure of the article.* A circular giving the text of the act and regulations for its enforcement may be had upon request.

NATURE OF THE HEARING

This hearing is informal and confined to questions of fact. For your convenience in submitting required information concerning the status of your firm both on date of response to this notice and on the date of shipment the attached legal status forms may be filled out and returned with your answer. Your answer may consist of the disclosure of any pertinent facts, letters, files, guaranties, shipping documents, analyses, arguments, etc., which you feel may disclose valid reasons why you should not be prosecuted. *Documents to be submitted at the hearing to support your statements should be prepared in quadruplicate.*

In the case of articles that are adulterated or misbranded when introduced in interstate commerce the Federal Food, Drug and Cosmetic Act places responsibility on the interstate shipper, even though he may be only the distributor and not the manufacturer. Distributors may relieve themselves of responsibility if they hold a legal guaranty under section 303 (c) of the act. If the goods were sold to you by a party residing in the United States and guaranteed by such party to comply with the provisions of the act, you should submit in response to this notice evidence of that fact, and a statement as to whether the product at the time of the apparent violation by you was in the identical condition and bore the same labels as when received by you from the guarantor and the full name of the facts as you represent them.

RESULT OF THE HEARING

If, after the hearing has been held and consideration given to all the facts, it is the conclusion of the Federal Security Administrator that prosecution should be recommended, the facts in the case will be transmitted to the Department of Justice for appropriate action.

1961 List of Violations

Sample No.	Product	Shipped to:	Date Shipped (On or About)
82-031 H	"Bone-Meal Calcium Lozenges*** Contents: More than 31 34-grain Lozenges*** Price $1.00***"	Ernest C. Stapenhorst 2810½ Oakes St. Everett, Washington	1/3/47
82-032 H	"Nutrilite Capsules No. 10*** Contents 31 5½ grain capsules*** Price $10.00**" "Mineral Supplement Tablets*** Contents: 62 6½ grain tablets***"	Same	Same
82-033 H	"Nutrilite B & E Concentrate*** Contents 1 fluid oz. (25 grams)** Price $3.59**"	Same	Same

1962 CHARGE SHEET

sample nos. 82-013 33 H

Prohibited Act: The introduction or delivery for introduction into interstate commerce of any food or drug that is adulterated or misbranded.

Misbranded: Statements in the labelings of the articles, namely: Manual entitled, "How to Get Well and Stay Well", Circular entitled, "Your Body Will Thank You", Card headed, "Purchaser's check of disorders at start of program", Sales Manual for Nutrilite Products Company entitled, "Sales Ideas for Increasing Earnings", Circular entitled, "Read this First", Deficiency Disease Chart containing alphabetical list of diseases, Circular entitled, "Suggested Use of Nutrilite Products", Circular entitled, "What's Wrong With You", are false and misleading, since they create the impression that the products are effective in the treatment of the diseases and abnormal conditions mentioned therein, whereas they are not effective in the treatment of such diseases and abnormal conditions.

The labels of the articles fail to bear adequate directions for their use in the treatment of the diseases and abnormal conditions mentioned in the above-listed labelings.

Bone-Meal Calcium Lozenges (82-031 H). The name, "Bone-Meal Calcium Lozenges", is false and misleading as applied to a lozenge containing bone meal without added calcium.

Nutrilite Capsules No. 10, Mineral Supplement Tablets) (82-032 H). Its label fails to bear the common or usual names of each ingredient of which it is fabricated. Its label fails to reveal the material fact that potassium and magnesium salts of citric, hydrochloric, and sulfuric acids contained in the article contribute nothing to its nutritive properties. The name, "Mineral Supplement Tablets", creates the false and misleading impression that the

article is an effective mineral supplement when used as directed, whereas it does not effectively supplement the diet with calcium, phosphorus, or iron.

1963 *Nutrilite B & E Concentrate.* The name "B & E Concentrate" is false and misleading as applied to a product which supplied only one of the B vitamins. The designation "Concentrate" is false and misleading since the article is not a concentrate but rather a weak solution of vitamin B_1 and alpha-tocopherol. Its label fails to reveal that the need for vitamin E in human nutrition has not been established. Information required by and under the authority of the act to appear upon the label, namely, the list of its ingredients, the proportion of the minimum daily requirement for vitamin B_1 supplied by a specified amount of the article, the fact that the need for vitamin E in human nutrition has not been established, and the declaration of quantity of contents of the package, does not appear conspicuously so as to be likely to be read by the purchaser; and label space which might be used for this purpose is used for other purposes.

WBR:AGM:mae

1964 82-036-H.

Nutrilite Capsules No. 15.
Mineral Supplement Tablets.
Bone-Meal Calcium Lozenges.
Nutrilite B & E Concentrate.

CHARGE SHEET

Prohibited Act: The introduction or delivery for introduction into interstate commerce of any food or drug that is adulterated or misbranded.

Misbranded: Statements in the labelings of the articles, namely:

Manual entitled, "How to Get Well and Stay Well", Circular entitled, "Your Body Will Thank You", Card headed, "Purchaser's check of disorders at start of program", Sales Manual for Nutrilite Products Company entitled, "Sales Ideas for Increasing Earnings", Circular entitled, "Read This First", Deficiency Disease Chart containing alphabetical list of diseases, Circular entitled, "Suggested Use of Nutrilite Products", Circular entitled, "What's Wrong With You", are false and misleading since they create the impression that the products are effective in the treatment of the diseases and abnormal conditions mentioned therein, whereas they are not effective in the treatment of such diseases and abnormal conditions.

The labels of the articles fail to bear adequate directions for their use in the treatment of the diseases and abnormal conditions mentioned in the above-listed labelings.

Nutrilite Capsules No. 15. The label fails to list the proportions of the minimum daily requirements for vitamins A, B_1, C, D, and riboflavin supplied by one capsule.

Mineral Supplement Tablets. Its label fails to bear the common or usual names of each ingredient of which it is fabricated. Its label fails to reveal the material fact that potassium and magnesium salts of citric, hydrochloric, and sulfuric acids contained in the article contribute nothing to its nutritive properties. The name "Mineral Supplement Tablets" creates the false and misleading impression that the article is an effective mineral supplement when used as directed, whereas it does not effectively supplement the diet with calcium, phosphorus, or iron.

Bone-Meal Calcium Lozenges. The name "Bone-Meal Calcium Lozenges" is false and misleading as applied to a lozenge containing bone meal without added calcium.

1965 *Nutrilite B & E Concentrate (82-033 H).* The name, "B & E Concentrate", is false and misleading as applied to a product which supplies only one of the B vitamins. The designation, "Concentrate", is false and misleading since the article is not a concentrate but rather a weak solution of vitamins B_1 and alpha tocopherol. Its label fails to reveal that the need for vitamin E in human nutrition has not been established. Information required by and under the authority of the act to appear upon the label, namely, the list of its ingredients, the proportion of the minimum daily requirement for vitamin B_1 supplied by a specified amount of the article, the fact that the need for vitamin E in human nutrition has not been established, and the declaration of quantity of contents of the package, does not appear conspicuously so as to be likely to be read by the purchaser; and label space which might be used for this purpose is used for other purposes. The article is materially deficient in vitamin B_1.

1966 PLAINTIFF'S EXHIBIT 10

Los Angeles, California, July 23, 1947
Date of Hearing: July 15, 1947

82-031, et al — Mytinger & Casselberry
Drugs — Long Beach, California

RECORD OF HEARING

Present: Mr. Lester L. Lev, Mr. Lee S. Mytinger, Mr. Lee J. Myers, Mr. C. F. Rehnborg, Dr. Wm. S. Casselberry.

Mr. F. Leslie Hart, Acting Chief, Los Angeles Station.

Response was made to citation by Messrs. Lee S. Mytinger and Dr. William S. Casselberry of Mytinger and Casselberry, Mr.

C. F. Rehnborg representing Nutrilite Products, and Mr. Lee J. Myers and Lester L. Ley, attorneys. Response was in the main made by Mr. Myers. Mr. Myers stated that the citees are not the manufacturers. These products are manufactured by Nutrilite Products and are distributed by the Nutrilite Products under the Nutrilite labeling. These products were bought under a continuing guarantee embodied in a contract dated September 1, 1945. The thiamin which is an ingredient of 82-033 H was crystalline thiamin purchased from Merck under invoice guarantee, copies of these two guaranties will be supplied us in quadruplicate.

Nutrilite Products has been in business some 15 years. Up to five years ago they had been bringing labeling to this office for comment and there has been no change in the labeling in the past five years. Mr. Myers said while he does not admit definite violation the labels can, of course, be materially improved and this he intends to do. The accompanying literature mentioned in the charge sheet was written by Mytinger and Casselberry. Since citation issued, they have retained Mr. Myers who will revise this labeling.

The specific charges were then discussed. 82-033-36 H, Nutrilite B and E Concentrate—Mr. Myers was told there was approximately a 30% shortage in thiamin. He will formally request a portion of this product for assay. He has no further answer until assay on this sample has been concluded. I informed Mr. Myers that we have very little sample left but I would endeavor
1967 to get him a portion of the sample as soon as his request was received.

In discussing the labeling charges on this product, Mr. Myers said that the labeling will be completely revised so that to make the quantity of contents more conspicuous and to bring the remainder of the label in harmony with the Act in line with the charges.

82-031 H—These Lozenges were first made entirely from bone meal and later, because of the fluorine content, it was diluted with dicalcium phosphate. I stated that while we did not charge it the fluorine content was still, in my opinion, rather high. Mr. Rehnborg said that he will try to use dicalcium phosphate or bone meal from another source so that he will lower the fluorine content.

82-032 H—In discussing the charge on this number that potassium and magnesium salts of citric, hydrochloric and sulfuric acids failed to contribute anything in it's nutritive properties, Mr. Myers stated that this will be modified in his revision of the label. As a response to our charge that the product does not supplement the diet with calcium, phosphorus, or iron, it was pointed out that the directions call for the use of this product along with the Bone-

Meal Calcium Lozenges and that the intake of the combined products does furnish material amounts of these three elements.

Dictated in presence of respondents.

Mr. Hart: Does this summary, gentlemen, fairly summarize your response to this citation.

Answer: Mr. Myers stated that all labeling including literature will be revised by him.

Answer: I think that is a fair statement.

Mr. Myer-: I will ask that you send a copy to me at my office, 608 South Hill, Los Angeles 14.

F. Leslie Hart, Hearing Officer, Los Angeles Station.

MATERIAL TAKEN OUT OF CUSTOMER BOOK

By this time you should have received notice from your Sponsor to take pages 37 to 58 inclusive out of your present Customer Books and to continue to use the Customer Book in your work without these pages.

Since this word was sent out by telegram to Potentates and top Agents and also relayed to members of their groups, there has been much speculation. The following is the explanation.

As you know, we have always endeavored to comply with the regulations of the Food and Drug Administration. As soon as we found that part of our original Customer Book was controversial, we made important changes at once and rewrote the book as fast as we could, so that the old Customer Book has not been published for many months.

We got the best advice we could, when we rewrote the Customer Book but now we find there is a difference of opinion as to what may be said. Anyway, we now have an expression of opinion from the Food and Drug Administration and they object to the last part of the Customer Book. Regardless of whether they are right or wrong, we want to comply with their views. Consequently, we are instructing you, as an Agent or Distributor, to remove from all Customer Books in your possession, pages 37 to 58 inclusive.

We suggest you do this by removing the cover and simply cut along the fold with a sharp knife, removing pages 37 through 58 in this way with one cut. Then the cover may be put back on the book and you may continue to use it.

As fast as you pick up books from prospective customers, be sure to make this change and if you have any books in the hands of customers, who are assisting you in getting leads, change their books too.

At the same time, discontinue the use of Nutrilifes Nos. 1 and 3, which are also, rightly or wrongly, criticized by the Food and Drug Administration. Put all your Nutrilifes Nos. 1 and 3 and all pages 37 through 58 from the Customer Books in a package, wrap, seal and get into the hands of some person who will keep them for you until the matter is settled.

In the meantime, we shall send you some additional pages to be put in the back of your revised Customer Books, following page 36, as soon as the material can be written and printed. This material will include a revised epilogue, which will fit the new book.

LEE J. MYERS

Attorney and Counselor at Law
608 South Hill Street
Los Angeles 14
TUcker 8930

Federal Security Agency
Food and Drug Administration,
Washington 25, D. C.

October 12th, 1948.

Gentlemen:

Yesterday, my clients, Mytinger & Casselberry of Long Beach, California received a copy of the Libel filed against certain of their products in the United States District Court for the District of New Jersey. I was immediately called into conference and it was decided to immediately discontinue the use of the leaflets entitled "Nutrilife Vol. 1, No. 3" and "Nutrilife Vol. 1, No. 1", and to delete from the booklet "How to get Well and Stay Well" all pages after page 36. This eliminates all statements and material to which objection was made in the Libel of Information.

Telegrams were sent to all general agents instructing them accordingly, and urging them to issue similar instructions to all of their sub-agents. Bulletins confirming these telegrams have also been sent to all agents in order that there may be no misunderstanding on their part.

In this connection I want to say that the filing of this Libel in New Jersey was the first intimation that we had received that any of the literature we are using at present was objectionable to your office. In the future I will appreciate it if you will advise me if you find anything in our literature that you take exceptions to. Mytinger & Casselberry are a reputable firm, and are desirous of co-operating with your Agency in every possible way. I need not point out that the offense of "misbranding" is not a well-defined one in the light of present day scientific knowledge, and it is very easy for a firm in the nutritional supplement field to make statements in the best of faith which do not "square" with the views of your office. In this case a letter from your Agency pointing out your objections would bring about a correction without the necessity of court action.

"Nutrilite" is an excellent food supplement, and thousands of persons have been benefitted by it. I am sure that it is not the intention of your Agency to prevent the public from using it. With mutual co-operation, I believe that much trouble and expense can be saved for all parties concerned.

Yours very truly,

(S.) LEE J. MYERS.

Nutrilite Prods Inc
Los Angeles Cal (AF 28-002)

9-082 K et al

Mr. Lee J. Myers
608 S. Hill Street
Los Angeles 14, California

Dear Mr. Myers:

We regret that through inadvertence your letter of October 12 concerning a libel action filed in the United States District Court for the District of New Jersey against certain products distributed by your clients, Mytinger and Casselberry of Long Beach, California did not receive a prompt reply.

In your letter you state that in the future if any objectionable labeling is encountered dealing with products distributed by this firm, you would appreciate receiving a letter from this agency pointing out the objections and appropriate corrections would be undertaken by the firm. As you are aware, the FFDC Act places the responsibility for compliance upon those who bring products within the jurisdiction of the federal law. There is no provision in the federal act for the approval of labeling. Experience of more than forty years in the enforcement of the FFDC Act and its predecessor, the Food and Drugs Act of 1906, has demonstrated that a procedure such as you suggest is not effective in affording consumers the protection Congress intended when these laws were enacted.

We recognize the desirability of discussing in advance labeling and other problems which arise under the federal laws which we enforce with manufacturers and distributors and have for many years followed a policy of offering freely our advice and cominents when requested. This procedure does, of course, prevent many violations. We cannot, however, assume the burden of taking these questions up with manufacturers in an informal fashion when misbranded or adulterated articles are encountered within the jurisdiction of the Act. We have likewise learned through long experience that
1973 when litigation is pending against a firm, discussions with the manufacturer or distributor concerning the same or similar issues which are involved in the pending cases have led to serious misunderstandings and ineffective enforcement operations.

Since there are both a prosecution action and several seizure actions pending against Mytinger and Casselberry and products distributed by that firm, we are not in a position at this time to discuss the propriety of the labeling which it is using or which it may contemplate using in the future. When the present cases have been terminated, we will be pleased to discuss with complete frankness our

views as to the requirements of the FFDC Act as they relate to the firm's business.

Very truly yours,

cc LA, cc Div Med, RFK: vqm, 11-4-48; AGM, 12/28

1974 AF 28002 Nutrilite Prods. Los Angeles.

Memo re Lee J. Myers ltr Oct 12th 1948.

This letter comes up for Answer Dec 28 1948 Myers is an astute attorney specialist in F & D cases. He is thoroly aware of procedure. He well knows the scheme of Nutrilite is not in our opinion a slight matter to be settled by talk or correspondence. He really doesn't say anything in his 10-12-48 letter that requires an answer. Our failure to answer cannot prejudice any finding or future action. The letter may be filed without answer with this memo.

PLAINTIFF'S EXHIBIT 16

STANDARD FORM NO. 64

5-31-49

Office Memorandum • UNITED STATES GOVERNMENT

TO : DIVISION OF FIELD OPERATIONS DATE:

FROM : Administration (Interstate)

SUBJECT: Nutrilite

Mytinger & Casselberry Inc
Long Beach Calif (AF 28-002)

As you know, the Administration plans to keep a sustained pressure against this company until an injunction is granted or the criminal case goes to trial. Since we are assuming for the purposes of the seizure actions we are taking, that the composition of the product is that claimed on the label and are basing our seizures principally on the accompanying labeling, we suggest it will be sufficient in the future to collect documentary samples only.

We have prepared a set of mimeographed copies of the principal labeling, the booklet "How to Get Well and Stay Well" for transmitting to the District Attorneys with request for seizure. We have also prepared mimeographed copies of the pertinent portions of the labels on the packages of Nutrilite. Perhaps when you report shipments for sampling, if the plan meets with your approval, you can enclose with the request one of the mimeographed copies of the booklet and package label. The inspector can compare those exhibits with the stock of Nutrilite and its labeling and wire the Administration if they are identical. The seizure recommendation to the General Counsel can then be prepared ~~and held in readiness for the receipt of the documentary sample from the Inspector~~ on the basis of the wire information as to date of shipment, amount, etc.

We hope such procedures will enable us to effect seizure more quickly and will save the cost of the physical samples, which is $19.50 each.

October 4th, 1947

Food & Drug Administration
1401 South Hope Street
Los Angeles 15, California

Re. 82-031/33 and 83-036H.

Gentlemen:

Pursuant to my telephone conversation with your Mr. Born, I submit herewith a written response to the Citation issued under the above number to Lee S. Mytinger and William S. Casselberry.

1st. I request that the response made July 15th, 1947, at the hearing before F. Leslie Hart, Acting Chief of Los Angeles Station, be made a part of this response, and that the information contained herein be added to the response of that date.

2nd. At the hearing held July 15th, 1947, respondents stated that the literature referred to in the Citation had been written by them without benefit of counsel, and that since the receipt of the Citation they had retained the writer to guide them in a revision of all of their labeling, including material not listed in the Citation. Rewriting of the literature used commenced promptly after the hearing of July 15th, 1947, and has progressed as rapidly as possible, considering the quantity of material involved, and corrections required by the writer. The revision of some of the pamphlets has been approved by me, while others are being rewritten to meet objections and criticisms made by me. When finally completed, I am sure that none of the literature will be objectional to the Administration.

3rd. The Deficiency Disease Chart has been discontinued, and all charts on hand have been destroyed.

4th. Labels for all Nutrilite Products have been revised, and proofs have been furnished you by Nutrilite Products Co.

5th. The revision of the labeling has been built around one theme which can be summarized as follows:

"Nutrilite Products are foods for use as a supplement to the regular diet; they do not cure, and are not offered as a cure for anything; their chief purpose is that of a food—to nourish

the body and to provide it with materials for its proper growth and function."

Respectfully submitted,

(S.) LEE J. MYERS,
Attorney for Lee S. Mytinger and
William S. Casselberry.

1982 PLAINTIFF'S EXHIBIT 20

IN THE DISTRICT COURT OF THE UNITED STATES IN AND FOR THE SOUTHERN DISTRICT OF CALIFORNIA—CENTRAL DIVISION

HONORABLE BEN HARRISON, JUDGE PRESIDING

No. 20,289—Criminal

UNITED STATES OF AMERICA,

Plaintiff,

vs.

LEE S. MYTINGER, ET AL.,

Defendants.

REPORTER'S TRANSCRIPT OF PROCEEDINGS

Los Angeles, California

Monday, June 6, 1949

APPEARANCES:

For the Plaintiff: T. G. Klinger, Esq.
For the Defendant Mytinger: J. E. Simpson, Esq.
For the Defendant Caselberry: Lee J. Myers, Esq.

1983 Los Angeles, California, Monday, June 6, 1949. 10:00 A. M.

THE COURT: You may proceed.

THE CLERK: United States of America, plaintiff, vs. Lee S. Mytinger and others, No. 20,289 Criminal.

Mr. KLINGER: Ready for the plaintiff.

Mr. MYERS: May it please the Court, I am Lee Myers. My associate counsel informs me that your Honor gets an impression from a reading of the affidavits, and I am addressing myself to the motion to suppress, that there is a conflict as to whether the defendants submitted to search, as we call it, and the government calls it an inspection of our records, prior to the time we demanded identification and authority from Inspector Gray, or whether we opened our records and then asked him who he was.

I didn't get that impression from reading these affidavits. I thought we were in agreement that the demand was made immediately upon Mr. Gray's coming into the office.

I wanted to make that observation, that if your Honor feels that there is a conflict raised by the affidavits, then I appreciate that you probably did not pass upon this motion.

THE COURT: Counsel, one of the authorities cited to me, that it was within the discretion of the court to pass upon this at the time of trial, I think one of the authorities cited holds something
1984 to that effect. I felt, however, that the motions had to be made in advance of trial to protect your record. I also felt that this is a matter that I could handle better at the time of trial after hearing the evidence. If I hold with you, then I can dismiss those counts and eliminate that from the picture. That is the way I felt. There may be no conflict—I don't know—but I felt I could take better care of it at the time of trial than I could in advance.

Mr. MYERS: Very well, we don't object to that.

THE COURT: I wasn't making any final ruling. The fact of the matter is, I felt there probably was some merit to your position but I felt that I would pass on it at the time of trial. Of course you have asked me to order a return of something to somebody in Washington or Oregon, some merchandise that was bought and paid for at that place.

Mr. MYERS: That is right. I think if your Honor granted the motion to suppress——

The Court: If I suppressed it, they still would have the information but as I say I think that is a matter for the court's discretion and to pass upon at the time of trial.

Mr. MYERS: Very well.

THE COURT: And if I feel at the time of trial that the information was wrongfully obtained, the court can easily take care of those two points.

Mr. Myers: Very well.

Now, we have another matter that I want to bring to your
1985 Honor's attention.

You will recall that in our conference in chambers a few weeks ago I made the suggestion, in the interest of shortening the trial time, that your Honor determine a question which we propose to raise, and that is whether certain literature, which never goes to the customer, can be considered labeling and made the basis of a misbranding count.

I thought we had agreed upon a stipulation and an accounting upon that assumption. I have already brief the questions involved and I have my briefs here. However, we have been unable to agree upon a stipulation. Counsel for the Food and Drug Administration insists upon inserting into the stipulation some controversial matters,

namely, as to what is in these pieces of literature that we say they admit do not go to the customer but go to the salesmen.

They want us to stipulate as to what they contain, and it is our position that it doesn't make any difference what they contain if they cannot be construed as labeling under the Act on the basis that they never go to the customer.

THE COURT: Counsel, I don't want to interrupt you, but you were not present when Mr. Simpson and I had a discussion a few days ago, when I made the statement that the government would have the burden of establishing the use of that literature that went to the salesmen and was not available to the customer or consumer. I told him that they might as well brief that question in advance of trial; and I want to say frankly that I haven't seen the literature that went to the consumer or the literature that went to the salesmen, but I got the idea that there was going to be a dispute as to the meaning of the literature that did go to the consumer. In other words, they make one interpretation and you make another. It is similar to an innuendo in a slander or libel suit.

The thought occurred to me, and I don't know whether it is worth anything or not, but if that dispute does arise it might be that the meaning could be explained by the circulars themselves.

As I say, I have never seen the literature but you say by indirection it may be good—it has curative value for certain things, and leave that impression, and you say it doesn't leave that impression.

Mr. MYERS: May I interrupt? Are you talking about the literature that goes to the customer?

THE COURT: Yes. That might be admissible to explain the meaning of the circular that was sent to the consumer.

Mr. MYERS: You mean the literature that never goes to the customer?

THE COURT: That is just a question or a thought that has come to my mind since discussing the matter in chambers with Mr. Simpson. This subject should be briefed. I realize that it presents a very serious legal question, and when I see the literature I may say, "Well, the literature speaks for itself and the other is immaterial."

As I told counsel for the government, I expect him to brief it and he is going to have the heavy burden of convincing me that that could be used.

Now, that is the way the thing stands.

MR. MYERS: I was hoping we could have a stipulation to the effect——

THE COURT: The question should be briefed and both pieces of literature submitted to the court, and then the court will be able to pass upon the question intelligently when it comes up and during the course of the trial I can rule.

Mr. MYERS: Very well. I have already briefed it.

THE COURT: You may have briefed it but it hasn't done me any good and I haven't had the benefit of the government's brief because I felt the government should have the burden of proof and that their brief should come first.

Mr. MYERS: Very well.

THE COURT: In any event I can't try it until fall. I am not sure just when I can try it.

Mr. MYERS: Then your Honor is perfectly willing to let us submit authorities on that point without a stipulation?

THE COURT: Not only willing but I want to invite it.

Mr. MYERS: Fine. Our only thought was we might shorten
1988 the time of trial considerably.

THE COURT: I realize that, but it presents a very serious question and it might mean the difference; so far as you are concerned, between placing the importance that you do upon it—it may mean the difference of there being a case against your client and not a case, and a ruling on that question is going to be vital to the case.

Mr. MYERS: We feel it will be.

THE COURT: And I would a good deal rather have an opportunity to study it in advance and try to give an intelligent ruling—at least satisfy myself I am ruling on it to the best of my ability—rather than give snap judgment. As a matter of fact, if I were to make snap judgment at the moment I would probably rule against the government, as I told counsel the other day, and you might have been better off to await the time of trial. At that time he may be able to convince me it can be used.

Mr. MYERS: Then the government will submit their points and authorities on that first and then we will reply.

THE COURT: I don't care how you submit them. All I want is the points and authorities.

Mr. MYERS: We have our own.

THE COURT: You might as well submit them and the government will submit theirs within 15 days. Maybe he has his ready. I don't know.

1989 Mr. KLINGER: Not yet, your Honor.

Mr. MYERS: We will serve counsel and file these with your clerk.

THE COURT: Is there anything further you want to add? You wanted to make a speech, didn't you, Mr. Simpson?

Mr. SIMPSON: No; I wanted to try to clarify some matters here which I think will be helpful if we go to trial on this, in settling the issues.

Your Honor has seen the objections that we had filed and the motions to strike from the files the affidavit of Mr. Rowe on our question of guaranty.

THE COURT: Yes.

Mr. SIMPSON: An objection to considering Mr. Rowe's affidavit upon several grounds—one that it was incomplete and lifted excerpts from letters supposedly written by Mr. Myers which were clearly hearsay.

THE COURT: I don't know that I can recall seeing all of those affidavits, but the point that was raised, as I viewed it, was that you have, you might say, two groups of defendants in this case, have you not?

Mr. SIMPSON: Manufacturers and distributors.

THE COURT: Manufacturers and distributors. Now, if this literature was put out by the manufacturer, that would present one picture as far as I am concerned. On the other hand, if this literature,
1990 assuming that it is objectionable, was put out by the distributor, that presents another picture, and I take the position that could not be fully developed in advance of the trial.

Of course our discussions here and the record in court is only partially complete because we have had so many conferences in chambers concerning the trial of this case. As I understand it, the government makes no contention that the product in dispute is not in accordance with the label as to its contents.

Mr. SIMPSON: The labels on the containers themselves. That is my understanding.

THE COURT: And that the government's case is predicated upon a false representation of the curative values of the product.

Now, if the manufacturer had nothing to do with that false representation I don't think the guaranty makes any difference. There is a question as to whether the product conforms to the guaranty—as to its chemical contents—and for that reason I felt that the guaranty in this case, under the facts as they have been represented to me, may or may not be a defense that I couldn't pass on until time of trial.

Mr. SIMPSON: This is what I have been trying to get clear. There is no question about the fact that there is a guaranty contained in this contract.

1991 THE COURT: I understand that, but that doesn't allow you to go out and cause a man to say: "This is common, ordinary table salt," and, because he guarantees that salt, to go out and say that it will cure a person of tuberculosis or something else.

Mr. SIMPSON: Now, here is the point I am trying to get at. This guaranty, which is referred to here, is dated the 1st of September, 1945, and, as I read it, it will protect the person guaranteed that the product is not misbranded within the meaning of the Food and Drug Act.

Now, the point that I am concerned about, and I think counsel for the government should also be, is this: They are seeking here

to hold the manufacturer, and yet they turn right around and attempt to show that the manufacturer isn't liable. They quote from a letter of Mr. Myers in which they say that the manufacturer didn't have anything to do with preparing or delivering the labeling which is involved. If he didn't, then the manufacturer should be eliminated from the case.

Now, let us turn it around the other way. They say in the same affidavit that the distributors prepared the literature which is involved in the case. Now, let us assume that that is true. The question is, When did they prepare that literature and when did the manufacturer have knowledge of it?

Now, my point is this: If this guaranty protects us for
1992 the labeling which was used in connection with the sale of this product as to literature which was prepared before the date of the guaranty—that is the question—are we protected if this literature was prepared before September 1, 1945? In other words, isn't that literature or labeling which was within the knowledge of the manufacturer at the time that he gave the guaranty, and if it was then aren't we protected by the guaranty?

THE COURT: Well, Mr. Simpson, I can't help but think that your experience on the other side of the fence would make it possible for you to easily understand what is happening. Both sides are working against the middle to eliminate the other, and thereby hoping to eliminate both. The trial will develop the facts, and probably at the trial one side is going to fall. If I had my way they would all fall.

Mr. SIMPSON: That would be fine with us.

THE COURT: I feel it is a waste of government money, but as long as the government wants to throw its money away I can't stop it. The new literature that is out cannot be affected by this case, but that is neither here nor there. But having been on both sides of the fence as you have, you can readily appreciate that the first thing you want to do is eliminate the manufacturer, and when he gets through, then he will help the distributor to eliminate himself. That being true, there is only one thing to do and
1993 that is put the whole matter before a jury and if the evidence develops the fact that the manufacturer didn't have anything to say about that, he will go out the door before it ever gets to a jury. But if he did have something to do with it, the jury may well convict them all. They may all be responsible.

Mr. SIMPSON: And that something that he did have to do with it, if he did, was before the date of the guaranty. That being true, then where do we stand? I represent a distributor and not a manufacturer.

THE COURT: I think the label refers to the chemical contents. I think you are trying to work both ends against the middle and I think further it is a question of fact for a jury.

Mr. SIMPSON: I am trying to clarify a question that may be partly factual and may be legal. I don't think the government can ever prove in this case that any of the literature which they are claiming was misbranded was ever prepared subsequent to the date of the guaranty.

Now, my point is that. If I am correct in that assumption, what we want to know is, aren't we protected by the guaranty? and if we are, there is no use in trying the lawsuit as to those people because they would be out.

We think that the guaranty protects us as to literature which was prepared prior to the date of the guaranty. That is part of your general law of guaranty in addition to bring covered
1994 by the scope of the Food and Drug Act itself. That is the point,

THE COURT: According to your contention the manufacturer would be responsible.

Mr. SIMPSON: I am not contending that he is. I am contending the distributor is not. That is the point.

THE COURT: But how can we tell until we get the facts, counsel?

Mr. SIMPSON: If we can get an indication from your honor——

THE COURT: And I am not going to make any.

Mr. SIMPSON: No; what I mean is this. I am not trying to get you to commit yourself, but suppose your Honor in considering the question here involved should say that (if the literature involved in this case and which the government claims constitutes the misbranding) was prepared prior to the date of the guaranty that is involved, then it will be covered by the guaranty.

THE COURT: And yet you ask for no commitment on my part.

Mr. SIMPSON: No. I would probably ask the government for a bill of particulars on the date that they claim the literature was prepared, because, according to my information, it was prior, and if it was, then if your Honor takes the view of the law which we think is correct, the distributors would be out.

1995 THE COURT: I thought you were asking for no advance ruling or commitment.

Mr. SIMPSON: I am only asking for an indication of it and then it would be covered by a bill of particulars.

If your Honor on the other hand says: "Well, you are not protected by your guaranty"——

THE COURT: What difference would it make as long as you are not asking for a commitment?

Mr. SIMPSON: It might have a little persuasive effect.

THE COURT: If what I have said hasn't any persuasive effect, I don't believe my ruling would.

Mr. SIMPSON: I think they are on the wrong track and I think in clarifying some of these things for them they might help, and if they had to sit down and find out specifically the dates that

we are talking about here and they knew that anything written before a given date was protected by the guaranty, they would soon find out whether they think they have a lawsuit and want to spend the taxpayers' money.

THE COURT: You are so far in the clear. I don't know what you are worrying so much about.

Mr. SIMPSON: Well, your Honor, as one who is always urging the saving of time and trying to clarify matters, I think certainly this would clarify it one way or the other.

THE COURT: These are matters that you and counsel will have to settle between yourselves.

1996 If there are any legal problems you want to brief in advance, you may do so and I will rule on them like on the question involved.

Mr. SIMPSON: There is a legal problem that is before your Honor right now and that is this, that we set up a guaranty.

THE COURT: I know that.

Mr. SIMPSON: A continuing guaranty.

THE COURT: After all, what we are doing here is more or less a pretrial. You are asking the government to disclose its hand and maintaining the position that you do not have to disclose anything.

Mr. SIMPSON: I am saying they have to disclose what they claim to——

THE COURT: I don't think so.

Mr. SIMPSON: —and what they show constitutes a defense against the guaranty. That is the basis of our motion to dismiss.

THE COURT: I told you the other day what I was going to do with it.

Mr. SIMPSON: I know you did.

THE COURT: I told you I would listen to you today, or you could hire a hall.

Mr. SIMPSON: Well, I am not hiring a hall. The illustration which we made the other day was a case of an advertising

1997 agency that was hired to write literature, and after it had been written they decided that the manufacturer——

THE COURT: Pardon me, counsel, but the only thing you are asking me to do is to virtually grant a summary judgment.

Mr. SIMPSON: No, I have a motion to dismiss here.

THE COURT: It would have the same effect and that would be a one-sided approach and the defendants wouldn't have to say anything. They wouldn't have to commit themselves. All you are asking for is something from the government. As I told you, I think it should be tried and it is going to be tried. It is my duty to try the case. I am not the United States Attorney. Probably, if I was, you wouldn't be here today or I wouldn't be the United States Attorney very long, one or the other. But that is neither

here nor there. I have to try the case and if there is a violation of the law the chips will have to fall where they may. I feel that this case in many respects is moot, but I will try it and rule the best I can. The facts will be up to a jury unless there is a ruling that is vital to the case, then I would have to grant a motion.

Mr. SIMPSON: That was the purpose of this motion, your Honor.

THE COURT: But you are asking me to do something in advance and I am not going to do it. You are asking me to pre-judge and pre-try a case, and I am not going to do it.

1998 Mr. SIMPSON: We are asking you to pass on this motion to dismiss on the grounds of the guaranty.

THE COURT: And I told you I wasn't going to do it.

Mr. SIMPSON: Then what are you going to do?

THE COURT: Deny your motion. You knew that Friday when you talked to me when you were in chambers with Mr. Klinger.

Mr. SIMPSON: So we may have the record clear, your Honor, will you now rule upon the objections which we made to Mr. Rowe's affidavit?

THE COURT: I will deny the motion to dismiss.

Mr. KLINGER: Before the denial, there were objections to Mr. Rowe's affidavit because I didn't quote from an entire letter. We did that in an effort to keep the document to a minimum, but in order to cure that defect, if such it be, we are prepared to prepare a supplemental affidavit which I will give to Mr. Simpson and Mr. Myers that has duplicate originals of the letters in their entirety, and I ask leave to file this supplemental affidavit at this time.

THE COURT: Did you furnish copies to counsel?

Mr. KLINGER: Yes.

Mr. SIMPSON: We agree the objections heretofore filed may be applied to this affidavit?

Mr. KLINGER: Yes.

THE COURT: I am simply denying the motion.

Mr. SIMPSON: Then I take it your Honor is also overruling
1999 the objections and the motion to strike the Rowe affidavit?

THE COURT: It is covered by your general motion, your motion to dismiss.

Mr. SIMPSON: No. There should be a subsidiary ruling on that.

THE COURT: I will deny it.

Mr. SIMPSON: If the affidavit of Mr. Rowe is not in the file, then we would have an uncontradicted motion which your Honor —I don't know that he would grant it or deny it in view of the state of the record.

THE COURT: I am still going to deny the motion.

Mr. SIMPSON: Then both motions will be denied?

THE COURT: Yes; three of them if necessary, counsel.

Mr. SIMPSON: I don't know of any others.

Mr. KLINGER: May I ask, was there a ruling that we would have 15 days to file authorities on the other subject? We would like a little more time.

THE COURT: I am starting tomorrow morning on a case that will take three weeks to try, and I will not have time to consider them before that time.

Mr. KLINGER: We would like at least 30 days.

THE COURT: I told you before, it will be after the summer vacation before this case can be tried, so there is no reason why anybody should be rushed.

Mr. KLINGER: Will your Honor set a date for the setting?

2000 THE COURT: I am not going to set a date until the second Monday in September.

Mr. KLINGER: It will be on for setting at that time?

THE COURT: Yes.

Mr. KLINGER: What date is that?

THE COURT: The Clerk will give you the date.

Mr. SIMPSON: And may we have 10 days to answer?

THE COURT: Yes.

THE CLERK: That is September 12th, the second Monday in September.

(Whereupon, at 3:00 o'clock p. m., the above-entitled matter was concluded.)

2001-2002 CERTIFICATE

I hereby certify that I am a duly appointed, qualified and acting official court reporter of the United States District Court for the Southern District of California.

I further certify that the foregoing is a true and correct transcript of the proceedings had in the above entitled cause on the date or dates specified therein, and that said transcript is a true and correct transcription of my stenographic notes.

Dated at Los Angeles, California, this 17 day of June, A. D. 1949.

J. D. AMBROSE,
Official Reporter.

2003 PLAINTIFF'S EXHIBIT 21

IN THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF NEW JERSEY

Civil Actions
No. C 11705—F.D.C. 25789
No. C 11878—F.D.C. 26123

UNITED STATES OF AMERICA, *Libelant*,

v.

91 PACKAGES, MORE OR LESS, LABELED IN PART: "NUTRILITE FOOD SUPPLEMENT . . .", ETC., *Respondent*,

89 PACKAGES, MORE OR LESS, LABELED IN PART: "NUTRILITE FOOD SUPPLEMENT . . .", ETC., *Respondent*,

MYTINGER AND CASSELBERRY, INC., A CALIFORNIA CORPORATION, 1724 SANTA FE AVENUE, LONG BEACH, CALIFORNIA, *Claimant*.

[Hearing on motion to consolidate and remove case to California.]

Newark, N. J., Monday, September 19, 1949.

Before THE HONORABLE GUY L. FAKE, U.S.D.J.

APPEARANCES:

Roger M. Yancey, Assistant United States Attorney, and Alvin Gottlieb, Attorney for Federal Security Agency, for Libelant.

Stryker, Tams & Horner, by Walter F. Waldau; and Charles S. Rhyne [Of Washington, D. C.], for Claimant.

2004 Mr. WALDAU: If the Court please, I have a motion which was on the list this morning. It had originally been on your list and was taken off pending proceedings in the United States Supreme Court. We were waiting in Judge Meaney's court and he has asked me if I could make an application to yo if you would hear it because he has just started a motion which counsel assures him will take two hours.

THE COURT: Very good, I will hear it. Take a recess for a minute.

(At this point a short recess was taken.)

THE COURT: What is the nature of this?

Mr. WALDAU: This is the removal of a case from this District to California.

THE COURT: Proceed.

Mr. WALDAU: If the Court please, in these motions in two matters, the motion is identical, and Mr. Charles Rhyne, of the Washington Bar, also a member of the Bar of the Supreme Court, is going to argue this matter for the defendant.

THE COURT: Very good.

Mr. WALDAU: May I introduce him and have him admitted in this cause?

THE COURT: Very glad to have you speak in the cause, sir. What is the title of this?

THE CLERK: There are two motions, No. 35 and No. 37, to be argued, as I understand it,——

2005 Mr. WALDAU: As one.

THE CLERK: As one motion.

Mr. WALDAU: As one motion. It is the same motion for both cases. The United States of America——

THE COURT: 35 and 37?

Mr. WALDAU: That's right.

Mr. YANCEY: If your Honor please, before we proceed I would like at this time to present to the Court Mr. Alvin Gottlieb, of the Federal Security Agency, a member of the District of Columbia Bar, who may participate in this hearing.

THE COURT: Very glad to have the gentleman speak in the cause.

Mr. WALDAU: May I submit our brief (handing up)?

Mr. RHYNE: May it please the Court, in this case, in these consolidated motions, the question is whether ten libel actions filed by the Government in nine different federal courts throughout the country should be consolidated for one trial and removed to Los Angeles, California, within twenty-five miles of our principal place of business. Our position is that since we have fifty witnesses who will be called and it will take about a month to try the case, and all of those witnesses are within this Los Angeles area; where our principal place of business is located, and since the Government worked up its entire case against us in Los Angeles and we believe that nearly all of their witnesses are there, that is the logical and
2006 most convenient place both for the parties and in the interest of justice to have the trial of this case.

Now, in a moment I will call your attention to the provision of the statute which gives us a right to a consolidation and to removal, so the only question before your Honor is the place of removal. I don't know just exactly what the Government's contention will be on that but I assume that they will make a contention which they have made in other cases, that these can only be consolidated and removed to the adjacent district, federal district, which in this instance would be five hundred miles away, in San Francisco, California, or five hundred miles in the other direction, in Phoenix, Arizona. I don't know whether that is the argument they will make but it is an argument they have made in other cases, so I assume

they will make it here; and it is our position, of course, that the trial should be in Los Angeles.

I would like to give your Honor just a word as to the background and the facts in these cases. The Government does not contend there is anything wrong with our product. Their entire attack is on our advertising pamphlet. The first seizure was made in Belleville, New Jersey, on October 6, 1948, and in that seizure they said that pages 37 through 58 of our pamphlet, containing certain testimonials, were false and misleading, and then they proceeded to make certain other seizures, in Spokane, Washington, St. Petersburg,
2007 Florida, Hastings, Nebraska, Clarkfield, Minnesota, Buffalo, New York, New York City, and Chicago, Illinois, and then another one here at Belleville, New Jersey.

The reason there are two motions is that when we received notice of the first seizure and what the Government was objecting to we notified all our salesmen to tear pages 37 through 58 out of the pamphlet and we would sell only with the first 36 pages. Then the Government made a finding that those 36 pages were misleading and started making more seizures, and then we added six pages to try to round out the pamphlet a little bit and they said that was misleading, too; and so then we conferred in Washington with them as to what we could do to try to comply with the law and they said that since we are in litigation, there was no advice they could give us. So we brought an action for an injunction in Washington and at the present time we are before a three-judge court in Washington and that court has enjoined the Government from making further seizures. We had claimed oppressive conduct in that they had deliberately planned these seizures so as to get us a long ways from our home in Long Beach, California, and we also attacked the constitutionality of one phase, one part, of the act that allowed the administrator of the Federal Security Agency to make a decision condemning our literature without giving us a hearing.

Now, they gave us this injunction, and then the reason the
2008 motion was taken off your Honor's calendar before was that the Government went to the Supreme Court of the United States, asking a writ of prohibition or mandamus and vacation of the injunction. The matter was argued at great length before the Supreme Court on the 16th of May and then they summarily denied the Government's petition asking that the injunction be vacated and set aside before we have a full hearing on the merits in this case——

THE COURT: Well, why can't everything be stayed until that issue in Washington is decided?

Mr. RHYNE: The contention of the Government, your Honor, is that that court can only hear the issue of oppressive conduct and constitutionality; that it can't hear the issue as to the nature of our label.

THE COURT: Yes, but why then can't everything be held? Why should there be so many suits?

Mr. RHYNE: Well, of course, the suits were stopped, you see, by the injunction, and we thought that we should move as expeditiously as possible to get these consolidated and removed out to Los Angeles for trial.

THE COURT: Aren't these suits all stayed now?

Mr. RHYNE: Yes, they are, your Honor; they are prohibited from doing anything.

THE COURT: What are you seeking now? Why are you seeking consolidation?

2009 Mr. RHYNE: The reason we are seeking consolidation and removal to Los Angeles is this, your Honor: The Government has advised us that they are going to file an injunction action out there against us, raising all the same issues that are involved in these libel actions. They contend that this issue of the misleading character of our pamphlet is not before the three-judge court, and of course——

THE COURT: Well; now, if they bring that action out there in Los Angeles, all these other actions will be stayed pending decision there—not actually stayed, but they wouldn't proceed with them, would they? or is it the Government's intention to proceed in all these different districts at about the same time?

Mr. RHYNE: Well, of course, the injunction keeps them from proceeding in these particular libel actions except the first one, they can proceed with that, and that is set for trial here or would be set for trial here in New Jersey, you see, and of course we want that one removed out to the Pacific coast, because we want a jury trial in these cases, and of course if they go by injunction we don't get a jury trial.

THE COURT: Why shouldn't this court stay its hand until the issue of constitutionality is disposed of? Why shouldn't all the courts wait, when so important an issue as that is being argued before the United States Supreme Court and in which they have refused

2010 to discontinue their injunctive order? Why shouldn't all the courts wait, including this one, holding everything in status quo?

Mr. RHYNE: Well, if the Government would agree as to the issues that are to be tried before that three-judge court—you see, the three-judge court has fixed two issues: one, the oppressive conduct of the Government, and two, the constitutionality——

THE COURT: Well, the three-judge court sits on the constitutionality of the statute primarily, doesn't it?

Mr. RHYNE: Yes, your Honor.

THE COURT: Nothing else.

Mr. RHYNE: They can consider——

THE COURT: Aside from factors that are necessary to——

Mr. RHYNE: —To pass on it.

THE COURT: —raise the issue.

Mr. RHYNE: That's right, your Honor. So we still have got to find out what we can do about this advertising pamphlet. Otherwise, when the three-judge court is finished, why, we still have this issue to be decided. So we would like to get it removed——

THE COURT: If the three-judge court decides the act is unconstitutional, that would set you free all around, wouldn't it?

Mr. RHYNE: No, your Honor, it wouldn't, I don't believe; because they don't pass on this issue——

2011 THE COURT: Well, then, there wouldn't be any act under which they can do what they are doing now.

Mr. RHYNE: There would be because the part that we attack is only the part that allows them to condemn our label——

THE COURT: Oh, yes

Mr. RHYNE: —at an administrative hearing without giving us a hearing, you see. They had an ex parte hearing and made this decision and our attack is on that, that they didn't give us a hearing before they made the decision that our label was bad, this pamphlet. So we still have the issue of what we can do and whether or not we are right or whether the Government is right about this advertising pamphlet.

This statute provides specifically for consolidation of this type of case and removal to a district——

THE COURT: What is the language of the statute on that?

Mr. RHYNE: It says, "When libel for condemnation proceedings under this section, involving the same claimant and the same issues of adulteration or misbranding, are pending in two or more jurisdictions, such pending proceedings upon application of the claimant seasonably made to the court of one such jurisdiction shall be consolidated for trial by order of such court and tried in (1) any district selected by the claimant where one of such proceedings is pending or (2) a district agreed upon by stipulation between the
2012 parties. If no order for consolidation is so made within a reasonable time, the claimant may apply to the court of one such jurisdiction, and such court (after giving the United States attorney for such district reasonable notice and opportunity to be heard) shall by order, unless good cause to the contrary is shown, specify a district of reasonable proximity to the claimant's principal place of business, in which all such pending proceedings shall be consolidated for trial and tried."

And of course, as I say, your Honor, we say that Los Angeles, the district court there, is a district of reasonable proximity to claimant's principal place of business because it is twenty-five miles away.

THE COURT: And I suppose they take the position that "proximity" means outside that jurisdiction.

Mr. RHYNE: Yes, they do, your Honor; which, as I understand, would be San Francisco, five hundred miles away, or Phoenix, Arizona, five hundred miles in the other direction. Now, I think that the situation on proximity—we think that on this very language we are entitled to have it moved to Los Angeles but there is something that has happened since that language which we think governs now; that is, the new judicial code, which your Honor may be familiar with; section 1404, that provides for removal of any civil action, to any district court where it might have been brought,
2013 and of course this could have been brought in California; and the Supreme Court of the United States in three very sweeping decisions on the 31st of May held that that language, "any civil action," means exactly what it says. And the Government participated in one of those cases. This is the case of United States vs. National City Lines. There the Supreme Court on the 7th of June, 1948, held that since the anti-trust law gives the plaintiff his option of where to maintain his suit, you couldn't remove a case from Los Angeles to Chicago, under the doctrine of forum non conveniens, because there was no statutory provision allowing it. As quick as this new judicial code went into effect in September, 1948, they again moved to move it to Chicago and an order was so entered by the district court out in California, and then the Government contended that since the anti-trust laws were not named in the new judicial code, you couldn't make such an order, that still the anti-trust laws controlled; and the Supreme Court of the United States said this:

"In taking the position that the District Court lacked authority to enter its order of transfer, the Government has advanced many of the arguments which we have already considered today—and rejected—in Ex parte Collet, ante, * and Kilpatrick v. Texas and Pacific R. Co., ante, * in which we held that actions under the Federal Employers' Liability Act were now subject to the
2014 doctrine of forum non conveniens. The Government contends, for example, that Congress intended § 1404 (a) to apply only to actions the venue provisions of which were formerly contained in Title 28, rather than to 'any civil action' "—and they point out that ("the venue requirements in antitrust cases are defined in 15 U. S. C. § 22; in Liability Act cases, 45 U. S. C. § 56); and that the legislative history establishes very clearly that Congress had no desire substantially to change the law—indeed, the Government urges us to disregard the reviser's notes which were printed in the House Reports. We cannot accept this position for the reasons discussed in our previous decisions today."

And in those previous decisions the court simply said that when they said that a district court could transfer any civil action for the

convenience of parties and witnesses, in the interest of justice, it meant just what it said, and their argument that Congress didn't understand what they were talking about was all wrong, simply because they didn't refer to anti-trust cases.

Now, there is one other provision of law I would like to call to your Honor's attention; I think it is very important here. It is in section 1404 subsection (b), the second sentence. It provides this:

"Transfer of proceedings in rem brought by or on behalf of the United States may be transferred under this section without the consent of the United States where all other parties request
2015 transfer."

And of course we are the only party and we do request transfer.

And so we believe, if your Honor please, that this is a case where, as I say, all the witnesses and records are in Los Angeles, are near Los Angeles, at our plant, twenty-five miles away, and we think that for the convenience of the parties and witnesses and in the interest of justice, there is where the trial should take place. It will take over a month to try the case. It is a very complicated case. I haven't gone into——

THE COURT: What is it; a health product?

Mr. RHYNE: No, your Honor, it is a vitamin product.

THE COURT: A vitamin.

Mr. RHYNE: And as I say, they don't say there is anything wrong with the product; they say that a pamphlet we use is false and misleading; and as I explained to you, when they first pointed out the parts of it they objected to, we took them out, and then we tried to go ahead with the other and when we did that, they said they couldn't talk to us while the litigation was on. So there is nothing else we can do but try the issues; we are just right up against it. And we think, if your Honor pleases, that aside from the argument that they will try to make about this Food and Drug Act only letting us come to the adjacent district—and I am not going
2016 into that in detail; I have a complete answer to that, I think, because the words "a district of reasonable proximity" would certainly mean twenty-five miles rather than five hundred miles. There has never been a case—they have won three cases holding it is the adjacent district there but there has never been a case involving the great distance we have here, and there has never been an appellate court case. Three district courts have made that holding that it is the adjacent; but aside from that, as your Honor can see, this new judicial code superseded the anti-trust law, superseded the Federal Employers' Liability Act, and certainly it superseded that, and it simply means that your Honor does have the authority to move this case where it will be most convenient for the parties and witnesses, in the interest of justice.

Mr. YANCEY: May it please the Court, the Government objects to the motion made by counsel for removal and consolidation of these cases to its home district in Long Beach, California. I might say at the outset, sir, that the history of this case as outlined by Mr. Rhyne really has no place at this particular hearing. Whether or not there are suits pending in Washington before a three-man court, whether the Government's actions were arbitrary and oppressive and what-not, has no place in the issue which is brought squarely before your Honor this morning.

There are two things, it seems to me, which should disclose
2017 and bring clearly to this Court the reasons why this suit or these suits should not be consolidated and removed to the Southern District of California at Los Angeles, which as I understand it, is about twenty or twenty-five miles from the place of business of the claimant company. In the first place, as counsel stated, for the claimant, some of these suits were instituted back in October of 1948, and one of the provisions of the act says that the application for removal should be "seasonably" made. It is our understanding that, as a matter of fact, when one of the seizures now pending in the District of Nebraska is ready to go to trial, they have made no effort at all to proceed seasonably with this motion.

Number two, it points up very clearly to us that if we do not consent, and we have refused to stipulate, that this be taken to any particular district, upon application to the court and good cause being shown, the court can order the removal for trial to a district of reasonable proximity.

Now, I might call to your Honor's attention that the Food and Drug Act did not——

THE COURT: Proximity to what?

Mr. RHYNE: To the place of business of the claimant.

A careful study, sir, of the legislative history of this act points up clearly the reasons for it. We didn't write the act; we simply
2018 are attempting to carry out the legislative intent of Congress; and with your Honor's permission, during the debate on this bill, in discussing what is reasonable proximity, one of the members of the House stated, Mr. Houston: "Then as I understand it, under the provisions of this bill, it is providing for what might be called neutral ground."

Mr. Lee, another member of Congress, said "That is the object."

THE COURT: Well, apparently from what counsel on the other side said, those notes were stricken out; the Court paid no attention to them, the United States Supreme Court.

Mr. YANCEY: That is correct, sir.

Mr. RHYNE: I beg your Honor's pardon?

THE COURT: Read it

Mr. RHYNE: The Supreme Court left the injunction in effect and——

THE COURT: No, in the course of your argument I think you read something to the effect that the committee members' notes were disregarded by the Supreme Court and they took the language for what it actually meant.

Mr. RHYNE: That's true; I did read that language, your Honor.

THE COURT: That appeared in the Supreme Court opinion.

Mr. RHYNE: That appeared in the Suupreme Court opinion.

THE COURT: Read that. Do you have it there.

2019 Mr. RHYNE: Yes, I do, your Honor.

Mr. YANCEY: But may I say this? unless you want to get——

THE COURT: Don't waste any time on those notes. The Supreme Court has rejected them.

Mr. YANCEY: But they were considering two separate items. What he is talking about, the legislative notes, were the ones regarding the 28 U. S. C. 1404, which have nothing to do with the enactment of the Food and Drug Act.

THE COURT: Well, all right; the United States Supreme Court went so far as to say that it applied to any and all actions, and that was with specific reference to Government bureaus.

Mr. YANCEY: We have an answer to that, sir. That simply means the moving of a civil action from one division to another. In section 1404 it says here, "For the convenience of parties and witnesses, in the interest of justice, a district Court may transfer any civil action to any other district or division where it might have been brought." But you must remember, sir, that this is an action in rem. You only bring it where the goods are seized, and when the seizure has been made upon an order of court, the monition issued, that court takes jurisdiction. Even in an admiralty proceeding, not a civil action, such as contemplated by this particular section, you couldn't——

THE COURT: I suppose these booklets have been libeled; 2020 is that it?

Mr. RHYNE: Yes.

THE COURT: Proceed.

Mr. YANCEY: That's right. Now (b), section (b) of 1404 says this:

"Upon motion, consent or stipulation of all parties, any action, suit or proceeding of a civil nature, or any motion or hearing thereof, may be transferred, in the discretion of the court, from the division in which pending to any other division in the same district."

Now, you see, if Congress——

THE COURT: Well, we don't have any such thing as a division.

Mr. YANCEY: That's what I am going to say now. So you see, if Congress had intended——

THE COURT: Some of the western States have divisions, but we don't have them.

Mr. YANCEY: That's right, sir, we don't have them. But let me point this out to you: If Congress had intended that an action of this kind could be moved from one district to the other it would have been put in (a) rather than in (b).

THE COURT: It seems to me to be founded in good, sound logic and commonsense that a case should not be commenced in New Jersey where all the witnesses come from California. It
2021 seems to me to be the equivalent of what our ancestors fought against when they complained about trials beyond the seas, and our Congress has apparently taken notice of that and made provision for bringing the suit in the vicinage where it can more conveniently and inexpensively be dealt with. Now if the place of business with which we are concerned here is Los Angeles, it seems to me an outrageous thing that fifty or sixty witnesses should be brought from Los Angeles, be kept in hotels at the expense of those parties for perhaps thirty days, while a case is being tried, when it could be tried right where they are.

Mr. YANCEY: Now just one minute, your Honor. May I make this objection? We are not opposing this from the point of view of having the case stay here in New Jersey. We are simply following the law. The law says, in accordance with the statute and everything else, the forum of reasonable proximity. Now, we will stipulate, agree, that this case be tried in Arizona. The law says that it should not be tried in the district in which the company is located; that's clear. But——

THE COURT: Just a moment on that. You read the statute to me or gave me the substance of it a moment ago and I asked you "Proximity to what?" and you said "Defendants here—proximity to their place of business."

Mr. YANCEY: At the adjacent district. That is what is
2022 meant.

THE COURT: Now the nearest approximation to their place of business is Los Angeles, twenty-five miles away, isn't it?

Mr. YANCEY: Well, they live in that district, sir. That's the very thing that the Congress attempted to get around when it passed this law; it said "reasonable proximity," and I was reading to you, sir, the excerpt from the debate and I didn't get a chance to finish it.

THE COURT: Well, I take it from what you say now that if you were to take all of the nine cases and consolidate them and bring them in that district, you would consent to it.

Mr YANCEY: No, no; we would be willing to consent to the consolidation of all nine cases and letting them take it to Phoenix, Arizona. Now the reason that we are not——

THE COURT: Now just a moment.

Mr. YANCEY: Yes.

THE COURT: Is the other side satisfied with that?

Mr. RHYNE: No, your Honor. That's five hundred miles away. We would still have to move our fifty witnesses. I don't know how many they have but they must have that many; they worked this case up against us in Los Angeles. There is where all of their records are; there is where all of our records are. We are twenty-five miles from Los Angeles. We can bring our people in each day.

Mr. YANCEY: Now, may I say this, too, your Honor? that
2023 in the Northern District, the next one so far as we are concerned will be the Northern District of California——

THE COURT: Have you any cases? Have you any cases?

Mr. YANCEY: I haven't gotten a brief prepared, sir. I was only served with a brief this morning in it. But may I say this? Now the Northern District of California——

THE COURT: Just a moment. We will save some time.

Do you have a brief?

Mr. RHYNE: Yes.

Mr. WALDAU: I gave your Honor our brief.

THE COURT: All right; did you give them a copy?

Mr. WALDAU: Yes, we gave them a copy this morning. I understand the Department at Washington had a copy of that same memorandum some months ago.

Mr. YANCEY: I didn't see it, sir.

THE COURT: Mr. Yancey, how much time do you want to answer it?

Mr. YANCEY: What is that, sir?

THE COURT: How much time do you want to answer it?

Mr. YANCEY: Well, I think we ought to have—there isn't any rush about this thing, as far as I can see.

THE COURT: You could answer it in what—twenty days, ten days?

Mr. YANCEY: May I make one observation, your Honor? I would like very much for Mr. Gottlieb to answer just one angle that
2024 I think we ought to try to make clear to your Honor, if you will hear it.

THE COURT: I will be glad to hear it.

Mr. YANCEY: Then we will take about twenty days to answer. I think he could perhaps emphasize one point that we would like very much to make clear to you.

THE COURT: Yes; I will be glad to hear him.

Mr. GOTTLIEB: If the Court please, there have been many statements made this morning which are not precisely correct and I should like this opportunity to correct them.

In the first place, the injunction that stands against the administrator of the Federal Security Agency, the Attorney General, and several subordinate officials of the Food and Drug Administration

is not on the basis of harassment of the claimant here. I should like to point out that the issues, incidentally, which Mr. Rhyne kept referring to as the Government's issues, were drawn up by the Court, the three-judge court, in a pre-trial proceeding, and that one issue deals only with the constitutionality of one portion of the act, purely a point of law.

THE COURT: What point is that? What section?

Mr. GOTTLIEB: 304(a).

THE COURT: That doesn't mean much to me.

Mr. GOTTLIEB: Well, the section provides that if, without hearing, the administrator of the Federal Security Agency determines
2025 that reasonable cause exists to believe that a product, a product label, is materially misleading, to the injury or damage of the purchaser or consumer, he then has the authority to provide for multiple seizures, which is more than one seizure, which happened in this case. The administrator has determined, or his subordinates have, that this product, Nutrilite, is materially misleading, to the injury or damage of the purchaser or consumer, and then went about making ten seizures.

THE COURT: Apparently the issues that would be raised here would not be the same as they would be if the mails were involved; is that right? May I say this: Where the mails are involved, as I remember it, dealing with a medicine or a system of treatment for disease, the United States Supreme Court held in, I think it is called, the Magnetic Healing case, out in California, that where the Government was proceeding before the Postmaster General's authorities upon opinion evidence, it had no jurisdiction; that there had to be a plenary suit and a trial to a court where there was a difference of opinion among specialists, scientists and the like. Do you remember that case?

Mr. GOTTLIEB: Yes, sir; I am very well acquainted with that case.

THE COURT: Does this case fall in the same category?

Mr. GOTTLIEB: The Government does not believe so, sir,
2026 because this product is a simple vitamin and mineral preparation, something that is not unknown or experimental.

THE COURT: It is complained in this case that they put out false statements. Are those statements of experts or are they statements by users of the formula, whatever it is?

Mr. GOTTLIEB: Several of the libels were based upon so-called testimonial letters incorporated into the booklet which they disseminated.

THE COURT: Where someone, a user, said he was cured by it?

Mr. GOTTLIEB: Users, that is correct.

THE COURT: Now it was that individual's opinion that he was cured, wasn't it?

Mr. GOTTLIEB: That's right. It has absolutely no value before the law, so far as competency is concerned. An individual cannot testify as to his illnesses, as to what he has—he is not competent to; and he cannot repeat what his doctors told him on the ground of being hearsay.

THE COURT: What is supposed to be the virtue of this thing we are talking about?

Mr. GOTTLIEB: The Government's position is this: They put out a multi-vitamin and mineral preparation which contains practically every known vitamin and mineral there is. Now that's perfectly fine except that it is sold in connection with a certain booklet,
2027 certain booklets, I might say, pamphlets, and the Government has alleged that these pamphlets represent and suggest that this Nutrilite, this vitamin and mineral preparation, will cure almost everything, every disease known to mankind, right from cancer and tuberculosis down to I don't know what, but anything. They also represent that almost every disease that any individual in this country has is due to a diet deficiency, every common disease is due to simple diet, and if you take vitamins and minerals, you won't get those illnesses because the body will just throw them off. Now this company has in the past two years——

THE COURT: Well, in that Magnetic Healing case it was worse than that. It was a philosophy that the Court sustained—a mental attitude, with no medicine at all, scientific, Christian or Biblical teachings and the like, philosophies of cure that have nothing to do with Materia Medica, and they held people can advertise those things.

Mr. GOTTLIEB: Well, I might point your, your Honor,——

THE COURT: Take, particularly, such religions as Christian Science, and you have many of them out there in Los Angeles; it seems to be headquarters for that sort of thing.

Mr. GOTTLIEB: They are not selling a drug, your Honor. You may have a philosophy of life——

2028 THE COURT: That would seem to be a complete answer: they are not selling a drug; but they are selling a teaching, and if that is false, on the same theory as you say the teaching of the use of medicine is false, it would fall pretty close to being equal to each other.

Mr. GOTTLIEB: Well, I don't know in whose jurisdiction that would be. I can only say, in answer to that, that the Food and Drug Act, the Federal Food, Drug and Cosmetic Act, is only for the sale of drugs, foods and cosmetics, and even if somebody were disseminating a false philosophy——

THE COURT: I interrupted you. You wanted to make some special point.

Mr. GOTTLIEB: Well, your Honor I just wanted to point out that the issue in the three-judge court case in the District of Columbia is not that we are harassing these people; it is that we have been

oppressive and arbitrary in not affording them a hearing before we took this action; and what we say is simply that the act by its terms specifically says the administrator may make these findings without a hearing. But it has absolutely no bearing upon the various libel actions. The question there isn't a question of the merits.

THE COURT: The question there is whether the act of the Congress can rise higher than the Constitution, isn't it, that is before them?

2029 Mr. GOTTLIEB: Well, that's purely a constitutional point. I really don't want to go into it here; but the only thing I am trying to distinguish is the issues in that case and the issues in these various libel cases. There are two issues only in the various libel cases: (1) Does the booklet say what the Government says it does? (2) if it does say what the Government says it does, will the drug be beneficial in those respects? That——

THE COURT: Will you show me a page of what you are objecting to? I just want to see a page of it so that I will better understand these arguments. Let me have a copy of the booklet with the six or seven pages which you struck out.

Mr. RHYNE: Your Honor, I do not have a copy of the pamphlet. I would be glad to submit it. I will say to you this: It was presented to the Supreme Court and several other courts it has been before, and every statement by Mr. Gottlieb about its contents was seemingly rejected by those courts when they rejected the arguments made by the Government, because they looked at the pamphlet in question.

Mr. GOTTLIEB: I should like to point out, your Honor, that when this case first came before the three-judge court, they acted under the erroneous assumption that they were to try the merits of the case; that is to say, that they were to determine whether this stuff was any good for what they claim it to be good for. And

2030 so we went to the Supreme Court for a writ of prohibition only on the basis that they had no jurisdiction to try that issue. That was the issue pending before the various libel courts. Now on the return that the three judges made on the writ to show cause, they said that they weren't going to try that at all, that we were mistaken, and so the Supreme Court said, and there is no extraordinary remedy required. And then after they returned the writ to show cause in the Supreme Court, they put out these two issues, and if your Honor would like to look at them, you will see that the issues are entirely different (handing to the Court), that the merits have not been questioned, have not been inquired into, and will not be.

[At this point a short interruption in the hearing occurred.]

THE COURT: How far does that injunction issued by the three-judge court in the District of Columbia go? Does it have the effect of staying all litigation everywhere?

Mr. GOTTLIEB: All but the first seizure made, I believe.

THE COURT: Now what case is this before me now? Is it the first seizure made?

Mr. RHYNE: Yes, it is the first one.

THE COURT: Then you say that one is not stayed.

Mr. RHYNE: No, your Honor.

THE COURT: Why isn't it?

2031 Mr. RHYNE: Because under the statute they have an absolute right to bring one.

THE COURT: As it is now?

Mr. RHYNE: As it is now. It is only when they make multiple seizures that they have to make——

THE COURT: Well, if they make two, then why doesn't it stay also the first?

Mr. RHYNE: The injunction was not so written, your Honor. They go, I believe, perhaps——

THE COURT: I am concerned now on reading this with whether or not this Court isn't stayed. It would seem to me that immediately where there is shown a multiple of suits, no one could be excused from the operation of the injunction and they would all be stayed. I am very much afraid of that.

Mr. RHYNE: Do you want to explain it?

Mr. GOTTLIEB: Yes. Your Honor, the way we interpret that, the Federal Food, Drug and Cosmetic Act provides that the Government may make a seizure at any time. It isn't required to do anything as a prerequisite to making one seizure. That had been made in this case. Then before we made——

THE COURT: When you made No. 2, then you had a multiple, and it seems to me everything would be stayed. You couldn't

2032 have the issue until there was a multiple of suits.

Mr. GOTTLIEB: Well, the only things that we are concerned with are the multiples, not the original one. Those that come after the one are——

THE COURT: Well, the one becomes a part of the multiple. I don't know why the whole thing isn't stayed. I can't see any logic for saying that one is free of the injunction and all the rest are not simply because it happened to be the first suit started when, as a matter of fact, you couldn't have any multiple suits without others, and the minute you have, the one must be brought in with the multiple. Cover that in your brief, both of you.

Mr. GOTTLIEB: Very well. I would just like to go over very briefly the Supreme Court case Mr. Rhyne cited and the provision of the new Title 28. I would like to point out section 1404, Title 28, which Mr. Rhyne has quoted. He quoted the second sentence, paragraph (b). It says, "Transfer of proceedings in rem brought by or on behalf of the United States may be transferred under this section without the consent of the United States"—under this sec-

tion; but the first sentence refers to the removal, the transfer, in the same district between divisions. Section (a), however, says that "For the convenience of parties and witnesses, in the interest of justice, a district court may transfer any civil action
2033 to any other district or division where it might have been brought." Now it is our contention that the second sentence of section (b) is connected to the first sentence of section (b), referring to the transfer between divisions in the same district; that if it were meant to come under (a) it would have been put under (a) and not connected with (b) in the second sentence. I should like to point out in section (a) it says that the court may transfer any civil action to any district where it might have been brought. As Mr. Yancey has pointed out, this is an in rem action. The jurisdiction of the court——

THE COURT: Now being in rem, how can the libel against goods from Belleville, New Jersey, be effective in California?

Mr. GOTTLIEB: It cannot; the Court has no jurisdiction.

THE COURT: Therefore you conclude that the Court has no jurisdiction, because these particular pamphlets could not be seized in California.

Mr. GOTTLIEB: Precisely; and I should like——

THE COURT: You make that argument, do you?

Mr. GOTTLIEB: Yes, sir; and I should like to cover that in the brief. I notice——

THE COURT: Cover that in your brief.

Mr. GOTTLIEB: I notice they cite section 1395 (c). No, I beg your pardon. (a): "A civil proceeding for the recovery of a
2034 pecuniary fine, penalty or forfeiture may be prosecuted in the district where it accrues or the defendant is found." Therefore, they say the defendant is found in the Southern District of California; but they neglect to cite paragraph (b): "A proceeding in admiralty"—which this is—"for the enforcement of fines, penalties and forfeitures against a vessel"—in this case a drug—"may be brought in any district in which the vessel is arrested."

THE COURT: That has always been so.

Mr. GOTTLIEB: That is correct. It is the old in rem theory. The court has no jurisdiction to try an in rem case unless the res is in that jurisdiction.

THE COURT: What relief are you seeking here in this court in the suit you instituted here?

Mr. GOTTLIEB: We have instituted a suit for the condemnation and destruction of certain drugs which are contraband, illegitimate——

THE COURT: Of the drugs or of the pamphlet?

Mr. GOTTLIEB: Both. They have both been libeled.

Now, there are ten cases throughout the country. The act specifically says that they may remove, consolidate and remove,

under certain limited conditions. Now they say, "But section 1404 overrides that," and they cite Ex parte Collet in the Supreme Court. Well, I submit, your Honor, that Ex parte Collet does not so hold, and I would like to quote from the opinion. It says here:

2035 "Section 1404(a) does not limit or otherwise modify any right granted in paragraph 6 of the Liability Act or elsewhere to bring suit in a particular district." The Liability Act had no provision for removal in it. Therefore, the Supreme Court said they now have a provision for removal by virtue of Title 28; but they said "We agree"—the Code, therefore, does not repeal paragraph 6 of the Liability Act——

THE COURT: Well, I will tell you what you gentlemen do. You get these arguments in the form of a brief. I will give you twenty days. They have handed you their brief this morning.

Mr. GOTTLIEB: Yes, sir.

THE COURT: Very good.

Mr. WALDAU: We will have an opportunity to reply to their brief, your Honor?

THE COURT: Yes.

2036 The Los Angeles Times, Saturday Morning, June 30, 1945.

Third of W.A.C. Applicants Fail to Pass Physical Test

New York Times.

Washington, June 29.—Physical rejection, rates for Army women, long withheld by the War Department and released for the first time today by the expiring committee on physical fitness of the Federal Security Agency, showed that about one-third of all applicants for enlistment in the Women's Army Corps were rejected for medical reasons.

Mental and nervous causes led to 22 per cent of the rejections.

"The record of 33 per cent rejections for women indicates an even more serious health situation for women than the 40 per cent rejection rate did for men," said Dorothy La Salle, who has been in charge of the girls and women's program of the committee on physical fitness.

"It is to be remembered that these women were all volunteers, and at least thought of themselves as being well enough to join the W.A.C.," she said. "I am sure that if we could have a complete cross-section of the women between the ages of 20 to 50 a much higher rejection rate would be found."

Third Who Applied Rejected by WAC

Committee on Physical Fitness Reveals Ratios of Women Barred for Health Reasons

By Bess Furman. Special to the New York Times

Washington, June 29—Physical rejection rates for Army women, long withheld by the War Department and released for the first time today by the expiring committee on physical fitness of the Federal Security Agency, showed that about one-third of all applicants for enlistment in the Women's Army Corps were rejected for medical reasons.

"The record of 33 per cent rejections for women indicates an even more serious health situation for women than the 40 per cent rejection rate did for men," said Miss Dorothy LaSalle, who has been in charge of the girls and women's program of the committee on physical fitness.

Miss LaSalle had permission from the War Department to disclose percentages on the ten highest causes for medical rejections of Wac applicants.

As was the case with men turned away from the Army, psychiatric and neurological causes topped the list. With the civilian women who wanted to be Waes, 22 per cent were rejected for mental and nervous causes.

The next principal cause of women's rejections was gynecological and genito-urinary disorders, accounting for 17.9 per cent of rejections. Other causes in their order ran as follows:

Cardiovascular, 8.2 per cent; eye conditions, 7.9; overweight 6.6; ear, nose and throat conditions, 5; underweight, 4.7; venereal disease, 4.4; pulmonary tuberculosis, 4.1, and teeth, 3.1. Miscellaneous causes with lower percentages made up the remaining 16.1 per cent of medical rejections.

"It is very evident that physical fitness programs for girls and women are of equal importance to those of boys and men, and must be established if we are to have a strong nation," said Miss La Salle.

"With the men rejected it was found that a large proportion of their defects had been evident ever since they were in elementary schools," she added. "I am sure this would be also true of the women and girls rejected for service in the Wac."

The Committee on Physical Fitness will end its operations tomorrow because Congress cut off its appropriation. It has been in operation three years. Much of its educational and research materials will be turned over to the Office of Education.

Washington, D. C.
1943

ABSTRACT

During the period November 1940 through September 1941, approximately 3,000,000 registrants were examined at local boards. 1/ A typical group of 1000 registrants examined at local boards would be classified as follows:

438, or 43.8 percent, would be rejected at local board examinations.
90, or 16.0 percent of the remaining 562, would be rejected at induction stations.
Thus, of the original 1000 registrants examined, 528 registrants would be rejected, representing a combined rejection rate of 52.8 percent. 2/

Rejection rates increased steadily with age. For example, 41.6 percent of the 22-year-old registrants were rejected, either at local boards or induction stations, while 80.3 percent of the 36-year-old registrants were rejected.

Tooth defects were the leading cause of rejection, accounting for 16.5 percent of all rejections at local boards and induction stations. Other causes of rejection, and the percentages they constitute of all rejections are: eye defects, 11.7 percent; mental and nervous defects, 10.4 percent; cardiovascular defects, 10.0 percent; musculoskeletal defects, 8.9 percent; hernia, 5.9 percent; venereal diseases, 5.9 percent; ear, nose, and throat defects, 5.5 percent; tuberculosis and other lung diseases, 3.8 percent; educational deficiency, 3.8 percent; defects of the feet, 3.0 percent; underweight, 2.9 percent; other causes, 11.7 percent.

Negro registrants had higher rejection rates than white registrants at local boards and induction stations, 59.4 per 100 examined as compared with 51.9 per 100. Most of the difference in rejection rates was due to the higher rates of rejection for syphilis and for educational deficiency among Negroes, as Negroes had lower rates of incidence than whites for most other defects.

The average white registrant was 26.0 years old, was 68.5 inches tall, weighed 152.2 pounds, had a chest girth of 37.2 inches at inspiration and 34.3 inches at expiration, and had a waist girth of 30.8 inches.

The average Negro registrant was also 26.0 years old; he was 68.1 inches tall, weighed 150.8 pounds, had a chest girth of 36.1 inches at inspiration and of 33.6 inches at expiration, and had a waist girth of 30.0 inches.

SELECTION OF REGISTRANTS FOR EXAMINATION

The data on health defects presented in this bulletin were obtained from Reports of Physical Examination, Form 200, filled out at the local board physical examination of Selective Service registrants. 3/ The local board physical examination was only one stage in a systematic selective process by which men were drawn from their communities for training and service. At each earlier stage, certain classes of registrants were deferred and were not required to appear for physical examination. It may be helpful, therefore, to present a summary of the entire selective process as a means of defining the group of registrants who are under discussion here.

On October 16, 1940, 16,316,908 men aged 21 to 35 inclusive registered under the provisions of the Selective Training and Service Act of 1940. On July 1, 1941, an additional 773,536 men who had attained their 21st birthday in the meantime were enrolled in the second registration. In the first and second registrations combined, adding in men who registered belatedly there was by September 30, 1941 a total of 17,370,355 registrants in the continental United States.

Of this number, 974,304 registrants were in the armed forces by September 30, 1941; 783,351 by induction through the Selective Service System and 190,953 by direct enlistment. Reports of Physical Examination, Form 200, are available for registrants who entered the armed forces through the Selective Service System but not for registrants who enlisted through a recruiting station of the armed forces. This circumstance will be referred to in connection with the discussion of rejection rate data.

After registration, each registrant received an order number on the basis of the National Lottery. 4/ The order number determined the sequence in which each registrant was classified. As each registrant's order number was reached he was mailed a Questionnaire, Form 40. On the basis of his replies to the Questionnaire the local board considered his eligibility for deferment, and if he had grounds for deferment because of occupation, dependency, or other reasons, he was classified

---

1/ The present bulletin is based on tabulations of data from 21 representative states, representing local board physical examination of 121,700 registrants. These states are: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Florida, Georgia, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Minnesota, Montana, Oklahoma, Oregon, Pennsylvania, Utah, and Wisconsin. The basis on which the states were selected, and details of the sampling procedure are explained in the Technical Appendix.

2/ Rejection rates and other data presented in this bulletin pertain to the period November 1940 through September 1941. Subsequently, changes were made in examining procedures and in physical standards which influenced rejection rates appreciably.

3/ A specimen of Form 200, Report of Physical Examination, filled out with the record of a hypothetical registrant is presented in figures 6 and 7 in the Technical Appendix.

4/ A description of this and other Selective Service procedures appears in Selective Service in Peacetime; First Report of the Director of Selective Service 1940-41. Government Printing Office, Washington, 1942.

accordingly and was not called up for physical examination. Figure 1 is a pictorial flow chart which shows the order in which each registrant was considered for the various classes of deferment and the percentages of all classified registrants who had been put in each deferred class by September 30, 1941.

It was only after the possibility of deferment had been eliminated that the registrant was ordered to appear before the local board physician for physical examination. Only 22 percent of the men who were processed during this period were ordered to appear for local board physical examination. The local board physician, and in many

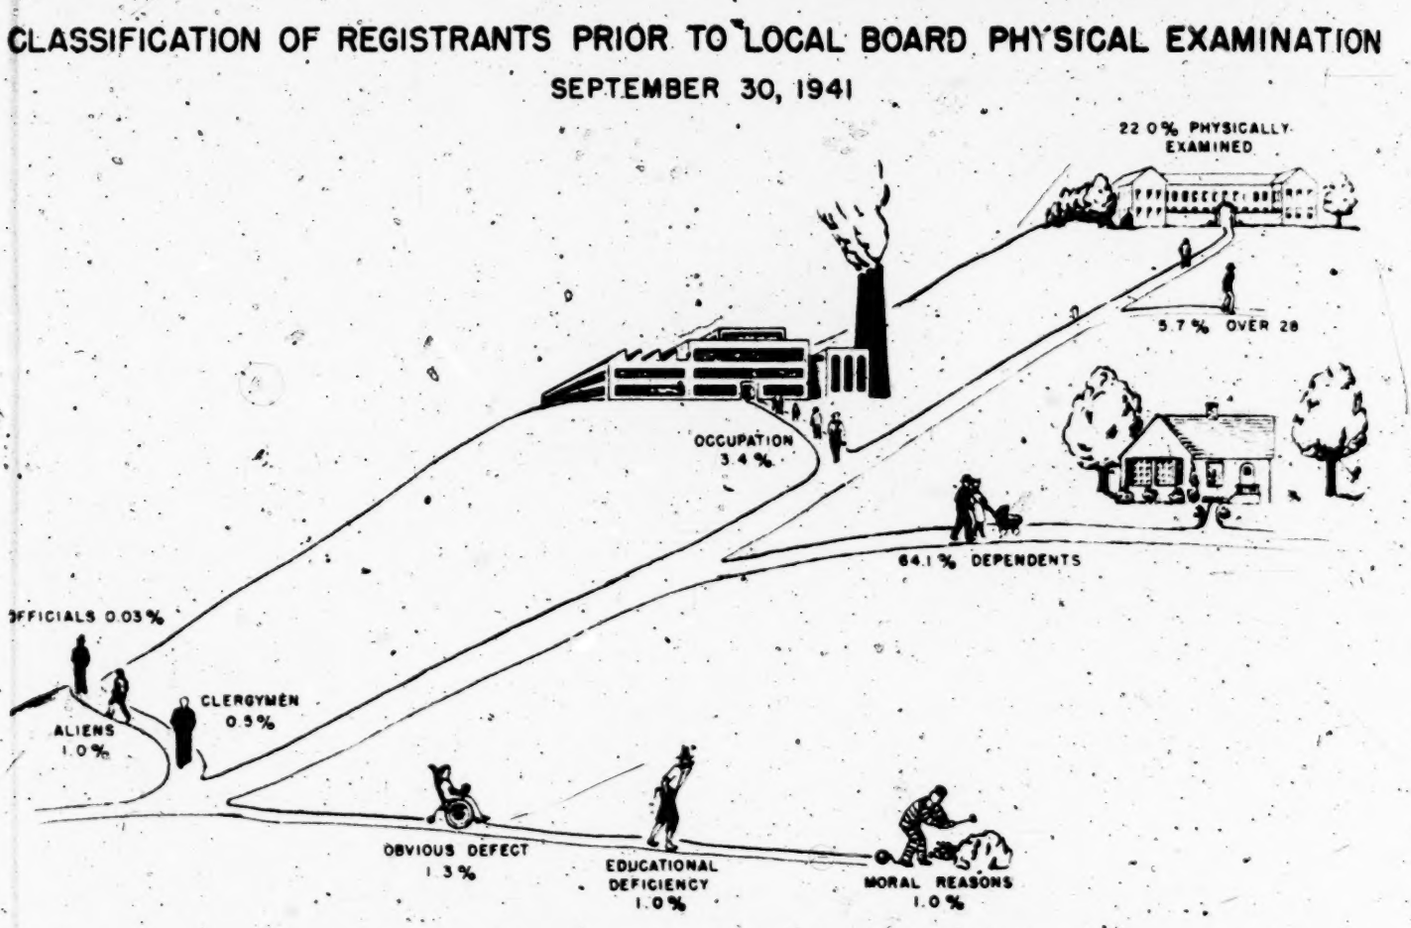

Figure 1. Pictorial flow chart showing the order in which a registrant was considered, successively, for deferred classifications. The percentage values show the percent of all classified registrants who had been deferred for the specified reason through September 30, 1941; data based on Accumulative Progress Report of Classification and Induction through September 30, 1941. These data are summarized in the Appendixes to Selective Service in Peacetime, pages 393-403, and 405. Selective Service Regulations governing classification of registrants may be found in Volume Three.

communities, the local board dentist, examined each registrant in accordance with physical standards prescribed by the War Department. 1/

Some indication of the nature of the local board physical examination can be obtained from the Report of Physical Examination reproduced as figures 6 and 7 in the Technical Appendix, and from the discussion which accompanies it. After the local board physician recorded his estimate of the physical fitness of the registrant the local board classified the registrant in one of three classes. 2/

Qualified for general military service, Class I-A;
Qualified for limited military service, Class I-B;
Disqualified for any military service, Class IV-F.

Registrants found to be qualified for general military service were forwarded to induction stations to fill calls levied on the local board. At

1/ Volume 6 of Selective Service Regulations includes Mobilization Regulations 1-9, Standards of Physical Examination During Mobilization, issued August 31, 1940. Further information on local board physical examinations appears in Selective Service in Peacetime, pages 205-218.

2/ A relatively small number of registrants who had complete physical examinations were not placed in I-A, I-B, or IV-F, either because of appeal or reconsideration by the local board for reasons other than physical or mental defect. Such cases are excluded from the tabulations reported here.

the induction station the registrant appeared before an examining board made up of Army physicians and civilian specialists who examined him in accordance with the same physical standards under which the local board examination was conducted.

This system, which involved two complete physical examinations, was discontinued January 1, 1942.

REJECTION RATES

From November 1940 through September 1941, 52.8 percent of all registrants physically examined at local boards were rejected either at local boards or at induction stations. Most rejections (43.8 per 100 registrants examined) took place at local boards. If the induction station rejection rate is computed on the basis of the number of registrants examined at induction stations it is 16.0 per 100 examined, as Table 1 shows. If induction station rejection rates are computed on the basis of the total number ordered to report for local board examination the rate becomes 9.0 per 100 registrants examined. 1/

Table 1. Rejection rates at local board and induction station, by race, November 1940 through September 1941

Racial group	Rejections per 100 registrants examined		
	Local board 1/	Induction station 1/	Local board and induction station
White and Negro combined	43.8	16.0	52.8
White 2/	43.3	15.1	51.9
Negro	47.2	23.1	59.4

1/ Rejected registrants include men classified as available for limited service (I-B) and men disqualified for any military service (IV-F).
2/ Includes all races other than Negro.

Rejection rates of this order of magnitude have been a matter of concern to everyone interested in the state of the public health as well as to those responsible for the administration of the Selective Training and Service Act of 1940. The great majority of these registrants had been drawn from useful occupations in civil life, which they had followed without apparent handicap. Furthermore, men aged 21 to 35 are below the age level at which degenerative diseases usually appear.

However, several pertinent factors have often been neglected in public discussion of these rejection rates. (1) A large number of physically fit registrants chose to enlist in the armed forces without awaiting induction through the Selective Service System. If they had entered the armed forces through Selective Service the records would show larger numbers of inductions, the same number of rejections, and lower rejection rates. (2) Failure to meet the relatively strict standards then in force did not necessarily mean that the rejected man was seriously handicapped for a useful role in civil life or for many kinds of noncombatant service in the armed forces. Approximately one-half of the rejected men were classified as available for limited military service. Subsequently, with changes in physical standards, many limited service men were reclassified and inducted. (3) During peacetime it was not merely possible but desirable to set higher physical standards than in wartime. At that time the problem was not to raise a large Army; the Selective Training and Service Act provided that no more than 900,000 men should be "in active training or service in the land forces of the United States at any one time." The objective was to select and train the nucleus of an Army composed of men physically fit for any type of service and the standards were set accordingly. As an example of the difference between peacetime and wartime standards, registrants with syphilis and gonorrhea were not accepted for training and service during peacetime; and this elevated the rejection rate, particularly among Negroes. Later, the standards were changed to permit acceptance of a considerable number of men with uncomplicated cases of syphilis and gonorrhea for treatment after induction. A further consideration that influenced the physical standards was the large number of claims for service-connected disability brought against the Government during and after World War I. In particular, the claims based on mental disorders, popularly but inaccurately termed "shell shock," had been so numerous and so costly that it was considered important to reject men who were likely to break down in service and become lifelong wards of the Government. (4) Under peacetime standards the proportion of registrants rejected because of failure to meet literacy standards, for moral reasons, or because they were aliens, was greater than under wartime standards.

Rejection rates for Negroes were higher than for whites at local boards and at induction stations. This is largely because of high rejection rates among Negroes due to syphilis and to failure to meet literacy standards, as Negroes had lower rejection rates than whites for most types of defects.

1/ These rates are slightly higher than the rates reported in Medical Statistics Bulletin No. 1 for the period November 1940 through May 1941. During the earlier period approximately 41 percent of all physically examined registrants were rejected at local boards and 15 percent of the registrants examined at induction stations were rejected. Of the total number examined at local boards through May 31, 1941, 50 percent were rejected, either at local boards or at induction stations. A considerable part of the difference between these rejection rates is attributable to the change in literacy standards effective May 15, 1941.

REJECTION RATES IN RELATION TO AGE

The regular increase in rejection rates with advancing age, shown in Figure 2 and in Table 2, had important consequences for the operations of the Selective Service System. The relationship may be illustrated by local board rejection rates for whites and Negroes combined. For men born in 1919, who were approximately 22 years old at the time of examination, the local board rejection rate was 32.8 per 100 registrants examined. With each additional year of age the local board rejection rate increased by about 2.5 percent. For men born in 1905, aged approximately 36 years, the local board rejection rate was 69.7 per 100 registrants examined. A similar, though less regular, relationship is evident in induction station rejection rates. Over the entire age range, induction station rejection rates increased by 1.8 per 100 for each additional year of age. Thus the combined local board and induction station rejection rate was 41.6 per 100 for men born in 1919 and increased by approximately 3.3 percent for each additional year of age until it reached 80.3 per 100 for men born in 1905.

The relation of age to classification after local board physical examination is shown in more detail in Figure 3, in which data for white and for Negro registrants are shown separately. Each bar shows the percentage in a single year of age who were classified as available for general military service, available for limited service, or disqualified for any service.

Table 2. Local board and induction station rejection rates per 100 registrants examined, by year of birth, November 1940 through September 1941

Year of birth	Local board	Induction station 1/	Combined local board and induction station
Total	43.8	16.0	52.8
1919	32.8	13.1	41.6
1918	35.9	8.0	41.0
1917	37.3	8.8	42.8
1916	39.5	10.7	46.0
1915	42.5	12.8	49.9
1914	45.7	13.1	52.8
1913	48.3	21.3	59.3
1912	51.3	28.1	65.0
1911	54.3	28.0	67.1
1910	57.4	30.6	70.4
1909	60.1	28.1	71.3
1908	61.4	33.1	74.2
1907	64.5	34.7	76.8
1906	68.2	36.1	79.7
1905	69.7	34.9	80.3
1904	74.2	47.5	86.5

CAUSES OF REJECTION

Table 3 presents, in summary fashion, the principal causes of rejection at local boards and induction stations. In it broad groups of defects are arrayed in order of their importance as cause of rejection, tooth defects leading the list, followed by eye defects, mental and nervous disorders, and cardiovascular conditions. These four causes account for almost half of the rejections during the period under study. Following these in order of importance as causes of rejection come musculoskeletal defects, hernia, venereal disease, ear, nose and throat defects, tuberculosis and other lung diseases, educational deficiency, foot defects, and underweight.

Induction station examinations were made to a large extent by specialists, and conditions that present unusual diagnostic difficulty, such as mental and nervous disorders and tuberculosis, are relatively more important as causes of rejection at induction stations than at local boards.

Numerous cases of venereal disease appear to have been contracted in the interval between local board physical examination and induction station examination. This is reflected in the induction station rejection rate for venereal disease.

Table 3. Local board and induction station rejection rates per 100 registrants physically examined, by principal cause of rejection November 1940 through September 1941 1/

Principal cause of rejection	Local board 2/	Induction station 3/	Combined local board and induction station	Percent of all rejections at local board and induction station
All causes	43.8	16.0	52.8	100.0
Teeth	7.8	1.7	8.8	16.5
Eyes	5.3	1.6	6.2	11.7

Feet	1.4	0.4	1.6	3.0
Underweight	1.4	0.2	1.5	2.9
Other	4.9	2.3	6.2	11.7

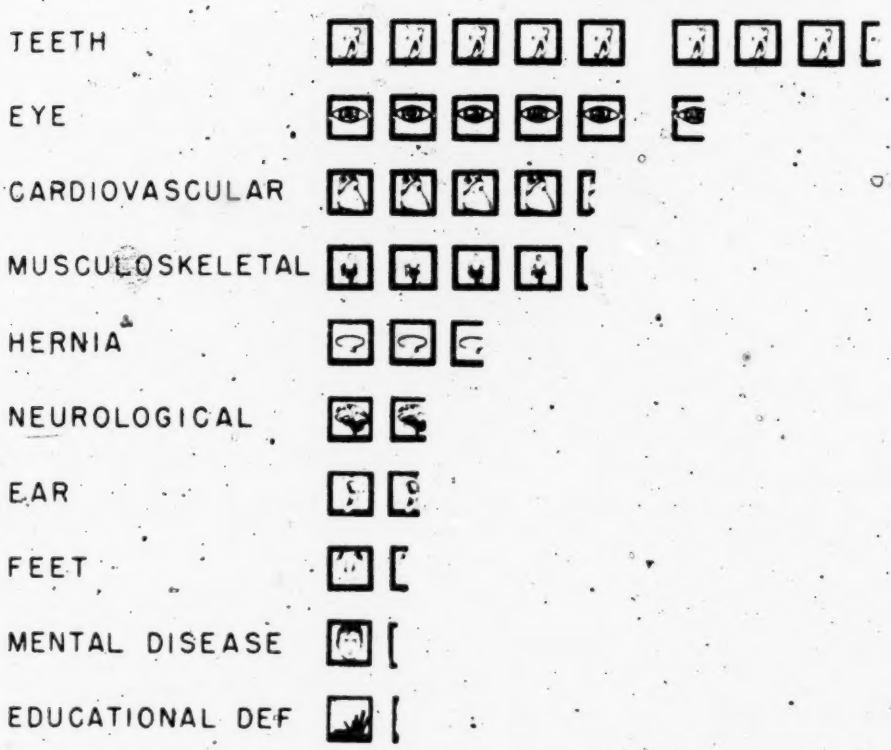
1/ Induction station rejection rate based on tabulations released by the Office of the Surgeon General, War Department.

2/ Based on 10-percent sample of Reports of Physical Examination through September 30, 1941 for 21 selected states.

3/ Rate for all causes based on Accumulative Progress Report of Classification and Induction through September 30, 1941. Rates for each cause based on report of rejections at induction stations for the period March 1941 through December 1941 as reported by the Office of the Surgeon General, War Department, and prorated to sum to a total rejection rate of 16 percent.

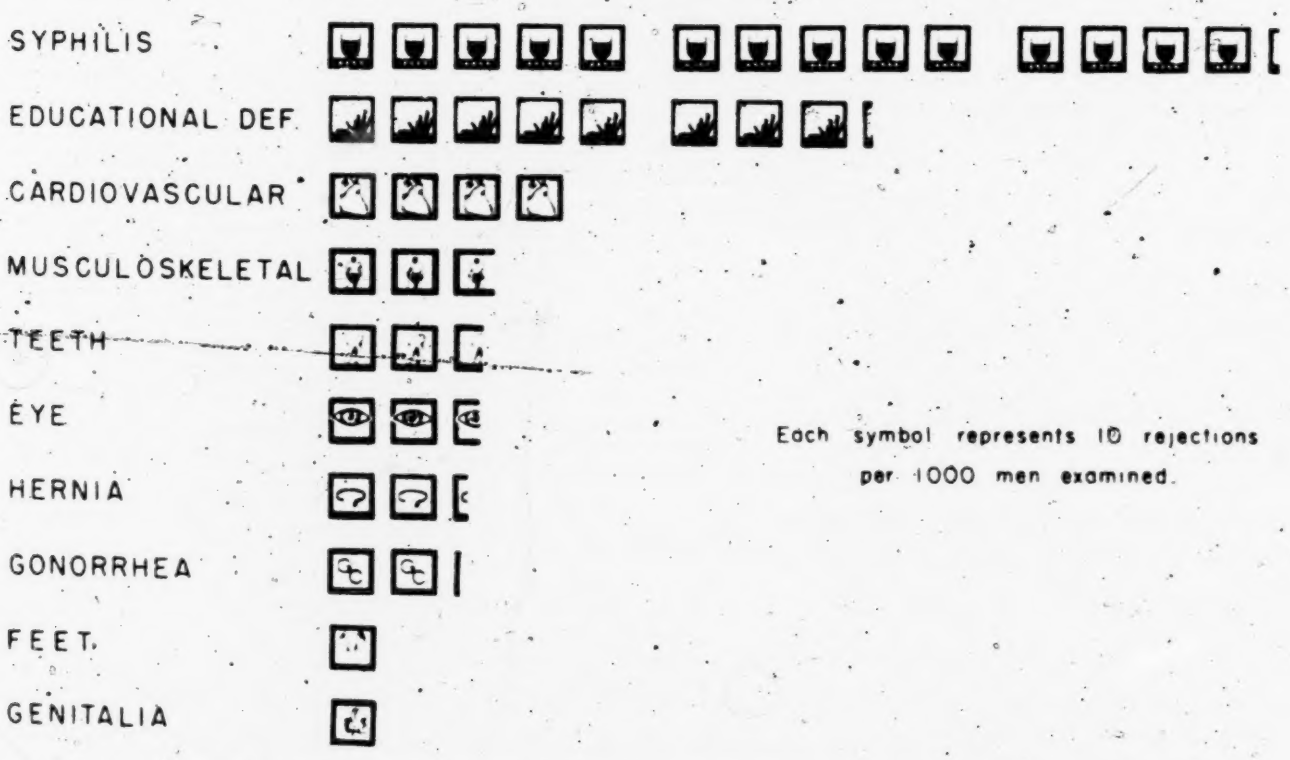
CAUSES OF REJECTION AT LOCAL BOARDS

The bar diagrams in Figure 4 show the ten leading causes of rejection of white and of Negro registrants at local boards, and are based on the data of Table 4. 1/



Teeth. Dental defects (missing teeth, dental caries, malocclusion, and allied conditions) were the leading causes of rejection at local boards and accounted for 17.7 percent of all local board rejections from November 1940 through September 1941. The rejection rate was more than 3 times as high for white registrants (84.1 per 1000 examined) as for Negro registrants (26.8 per 1000 examined). In both racial groups the majority of rejections for

1/ It should be noted that a defect tabulated in Table 4 as cause of rejection for any registrant was not necessarily the only disqualifying defect the registrant had. When more than one defect was recorded as cause of rejection in the section for classification by the local board (see Figure 5) the first defect listed was tabulated as the cause of rejection.



LEADING CAUSES OF REJECTION AT LOCAL BOARDS

NOVEMBER 1940 THROUGH SEPTEMBER 1941

WHITE

NEGRO

Each symbol represents 10 rejections per 1000 men examined.

Figure 4. Pictorial bar diagram showing the ten leading causes of rejection at local boards, among White and Negro registrants. Based on data in Table 4.

dental defects were due to failure to meet the following standards: "A minimum of 3 serviceable natural masticating teeth above and 3 below opposing and 3 serviceable natural incisors above and 3 below opposing. (Therefore, the minimum requirements consist of a total of 6 masticating teeth and of 6 incisor teeth.) All of these teeth must be so opposed as to serve the purpose of incision and mastication." 1/

Eyes. Defective or insufficient vision, refractive errors, and, less frequently, eye diseases or injuries were recorded as principal cause of rejection in 12.2 percent of all rejections. Again, the rejection rate was higher among white registrants, 56.9 per 1000 white registrants examined compared with 26.0 per 1000 Negroes examined. The standards for general military service then in force defined the lower limits of vision acceptable to the Army as "20/100 in each eye without glasses, if correctable with glasses to 20/40 bilateral." 2/

Cardiovascular. Defects of the heart and vessels were responsible for 10.0 percent of all rejections. The rates of rejection of whites and Negroes were 44.1 and 39.6 per 1000 examined, respectively. Specific causes of rejection were much the same.

Musculoskeletal. Defects of the bones, muscles, and joints were the basis of 8.9 percent of all rejections. Rejections for musculoskeletal defects amounted to 42.2 per 1000 white registrants examined and 28.5 per 1000 for Negro registrants. The disabling defect was usually described as the result of injury. The knee appeared to be the most vulnerable part of the body in this respect, injuries to leg (which may also include some knee injuries) were next in importance, and injuries to spine, foot, arm, and elbow followed in decreasing order of frequency.

Hernia. Rejections because of hernia amounted to 5.9 percent of all rejections. The rate for white registrants, 26.8 per 1000 examined, was not much higher than the rate for Negroes, 23.0 per 1000 examined. Inguinal hernias were most numerous. In about two rejections per 1000 the wording of the physician's entry was such as to suggest that relaxed inguinal rings rather than a true hernia was involved. Umbilical hernias were more frequently reported for Negroes than for whites.

Syphilis. Syphilis accounted for 5.3 percent of all local board rejections. It was the leading cause of rejection among Negroes, with a rate of 142.3 rejections per 1000 Negroes examined, and the fourteenth in order of importance among white registrants, with a rate of 7.5 per 1000 examined. Men with syphilis who were rejected for other reasons (eye defects, for example) would not be included in the foregoing.

Educational deficiency. Failures to meet literacy standards represented 4.2 percent of all rejections during this time period. It was the second most important cause of rejection among Negroes and the tenth in order of importance among whites. Between November 1940 and May 15, 1941 regulations 3/ stated that registrants were acceptable who "appear to have normal understanding, whose speech can be understood, who have no definite signs of organic disease of the brain, spinal cord, or peripheral nerves, and who are otherwise mentally and physically fit." During this period illiteracy was mentioned in the records of 3.6 registrants per 1000 examined. 4/

On May 15, 1941, the standards were raised to require that a registrant should be able to "read and write the English language as well as a student who has completed four years in an American grammar school." The latter standards were continued in force until August 1, 1942. 5/

Neurological. Organic defects of the brain or spinal cord resulting from disease, injury, or arrested development were listed as sole or principal defect in 3.8 percent of all rejected registrants. The rejection rate for whites was 17.7 per 1000 and for Negroes was 7.3 per 1000 examined. Among whites, the after-effects of infantile paralysis were the most frequently diagnosed neurological defect, followed by epilepsy, paralysis (other than infantile paralysis), deaf mutism, and cerebral symptoms described as the after-effects of head injury. Among Negroes none of these conditions was reported frequently; epilepsy, the after-effects of infantile paralysis, and deaf mutism were mentioned more frequently than other neurological disorders.

Ears. Among ear defects, which constituted 3.5 percent of all rejections, otitis media and perforated ear drum were most commonly specified as causes of rejection among white registrants, with defective hearing also a frequently mentioned cause. Among Negroes, on the other hand, only a few registrants were rejected because of otitis media or perforated ear drum, and defective hearing was given as the reason for rejection of most of the non-acceptable registrants.

Feet. Foot defects, which disqualified 3.1 percent of the rejected registrants, were ninth in order of importance for Negro registrants and eighth in order of importance for white. Flat foot was almost the only foot defect mentioned as cause of rejection. Registrants with flat feet were more

1/ Paragraph 31-a (2) of MR 1-9, August 31, 1940 edition, contained in Vol. 6 of Selective Service Regulations. These dental standards remained in force until February 13, 1942, when they were amended and lowered by Local Board Release 95.

2/ Paragraph 16b of MR 1-9, August 31, 1940 edition. These standards continued in force until February 13, 1942, when they were lowered by Local Board Release 95.

3/ Paragraph 75b, MR 1-9, August 31, 1940 edition.

4/ Medical Statistics Bulletin No. 1, page 25.

5/ Additional information on rejections for failure to meet literacy standards between May 15, 1941 and September 15, 1941 may be obtained from the results of a special survey summarized in Selective Service in Peacetime; pages 174-175 and Appendix 29. Appendix 29 shows the number and rate of rejections for educational deficiency, by state.

often accepted than rejected. Thus, flat feet were noted as present in 148 white registrants per 1000 examined but they were the cause of rejection in only 14 white registrants per 1000 examined. The longitudinal arch of the Negro foot is not as high as the arch in the feet of Caucasian races, and when a record of flat foot was made for a Negro registrant it was frequently accompanied by the notation "racial," or "physiological." It was the cause of rejection of 10 per 1000 Negroes examined. The only other foot defect important as a cause of rejection was club foot, which occurred relatively more frequently among whites than among Negroes.

The ten causes of rejection just discussed accounted for 74.6 percent of all rejections during this period.

Data on other causes of rejection may be obtained from Table 4 and may be supplemented by reference to Table 7, which shows the incidence of all recorded defects.

Table 4. Local board rejection rates, by cause and by race, November 1940 through September 1941

1/ Includes all races other than Negro.
* Less than 0.1 per 1000 examined.

INCIDENCE OF ALL RECORDED DEFECTS

The preceding tables showing causes of rejection have shown only one disease or defect per man. This does not mean that the defect listed in the table was the only impairment the rejected man had, but it does mean that the examining physician, when called upon to summarize defects in order of importance, put the specified defect at the head of the list. An average of 1.58 defects were recorded on each examination form.

In preparing Table 7 no distinction between disqualifying and non-disqualifying defects was made. Every defect recorded on Form 200 was coded and tabulated, subject only to the limitation that within each of the 28 broad groups of defects (for example, eyes, ears, teeth, etc.) only one defect was tabulated for any one man. Beyond that there was no limitation on the number of defects recorded.

Several broad groups of defects which did not appear among the ten leading causes of rejection in Figure 4 are among the ten most frequently recorded defects; namely, defects of the feet, skin, nose, and throat. The ten groups of defects most frequently recorded at local board examination follow:

White	Negro
Teeth	Feet
Feet	Syphilis
Eyes	Mouth and gums
Musculoskeletal	Teeth
Skin	Genitalia
Nose	Educational deficiency
Cardiovascular	Throat
Hernia	Musculoskeletal
Mouth and gums	Cardiovascular
Throat	Eyes

The discussion which follows deals with selected defects listed in Table 7. It is limited to defects which occurred with unusual frequency, to diseases that are important from the public health viewpoint, and to defects for which supplementary data are available. The rule that only one defect in each defect group could be tabulated for any one registrant has resulted in an underestimation of the frequency of occurrence of certain non-disqualifying defects, and the effects of this procedure will be pointed out. 1/

Eyes. All but 8 of the 88 cases of bilateral blindness shown in Table 7 represented registrants who were rejected by local boards because of obvious defect. 2/ Seven instances of bilateral blindness in addition to the 88 previously mentioned were tabulated in Table 7 in terms of the condition that caused blindness. Two cases resulted from cataract, two from diseases of the optic nerve, and one each from diseases of the cornea, eye injury, and from aphakia. Refractive errors or poor visual acuity accounted for approximately half the recorded eye defects 3/. The majority, however, were correctable to a visual acuity of 20/40 as measured on the Snellen chart.

Ears. One-half of the 86 cases of bilateral deafness reported in Table 7 represented rejections for obvious defect without physical examinations.

Teeth. The counts of missing teeth and of dental caries presented in Table 7 do not include many instances in which these defects were recorded only on the dental chart of Form 200. 4/ Frequently, a registrant was described as having both missing teeth and dental caries. In such instances, the term missing teeth was selected for coding and tabulation in preference to dental caries both because it represented the end-result of a pathological process and because it was the more important of the two conditions in determining a registrant's acceptability for military service.

Tuberculosis. Tuberculosis (all forms) was found twice as frequently (10.3 per 1000 examined) among white registrants as among Negro registrants (5.2 per 1000 examined). It may appear paradoxical that a disease in which the Negro death rate is higher than the white death rate should be found less frequently among living Negroes than among living whites but similar findings have been reported by several investigators, and have been confirmed by more recent Selective Service data. 5/

1/ Certain kinds of defects can be reported on Form 200 in either or both of two ways: (1) as words, phrases, or sentences written in lines 1 to 19 of page 2 (see Figure 7) or (2) as markings on the dental chart or as numbers representing the results of tests and measurements listed along the right-hand margin of page 2. Data presented in Table 7 have been obtained from the first of these two types of entry. In future publications data recorded on the dental chart and the results of tests and measurements will be presented and analyzed.

2/ Regulations provided that "The local board may put a registrant in Class IV-F without physical examination if he has an obvious physical or mental disability which permanently disqualifies him for any form of military service." Record of such an action was made on page 1 of Form 200.

3/ Until February 13, 1942, the lower limit of vision acceptable for general military service was defined in paragraph 16b of MR 1-9 dated August 31, 1940, as "20/100 in each eye without glasses if correctable with glasses to 20/40 bilateral." Local Board Release 95, February 13, 1942, reduced the visual standards for service in all noncombatant branches to 20/200 provided the vision was correctable to 20/40 in each eye.

4/ Counts of missing and carious teeth, coded from entries on the dental chart, which supplement the information presented here, have been carried on the punch cards from which these data were tabulated. At a later time, tables showing the total number of registrants with missing or with carious teeth will be prepared.

Robins, Arthur B. The development of tuberculosis in the apparently healthy adult. Amer. Rev. Tuberc. 47:1-10, 1943.

The difference in incidence of tuberculosis between Negroes and whites has been, in part, attributed to the more rapid course of tuberculosis in the Negro. 1/

Cardiovascular system. Cases of valvular heart disease have been classified, in Table 7, by the valve affected and the nature of the lesion. Excluding cases diagnosed as rheumatic heart disease, in the instances in which the valve was clearly specified, 79.0 percent involved the mitral valve, 13.7 percent the aortic valve, and 3.8 percent affected both the aortic and mitral valves. Lesions of the pulmonic and tricuspid valves were infrequent. There were, however, a large number of entries describing murmurs which did not specify both valve and phase and they have been classified under two titles in Table 7; "Systolic murmur, type unspecified," and "Murmur, type unspecified." A large proportion of the entries classified in the first of these two titles read "Systolic murmur at apex" or words of equivalent meaning.

Hypertension was a fairly frequent diagnosis among both whites and Negroes. Hypertension was not coded or tabulated when it was merely listed as one of the findings on which a diagnosis (such as rheumatic heart disease) rested. In one-fourth of the instances in which a diagnosis of hypertension was made the systolic blood pressure was under 150 mm. Hg. In 24.4 percent of the hypertension cases the pulse rate exceeded 100 beats per minute.

Transient hypertension includes instances in which high blood pressure was described as due to nervousness or excitement or in which it returned to normal levels after rest.

Hypertrophy was tabulated when it was used as a diagnosis. In 20.8 percent of the cases of hypertrophy the systolic blood pressure exceeded 150 mm. Hg and in 24.6 percent the heart rate exceeded 100 beats per minute.

Tachycardia, likewise, was tabulated when it appeared as a diagnosis. Persistent tachycardia represented heart rates in excess of 100 per minute in 93.2 percent of the cases tabulated. In cases not described as persistent the heart rate exceeded 100 per minute in 65.8 percent of the cases tabulated. In many individuals rapid heart rate was described as due to excitement or nervousness; they have been included in the title "Functional tachycardia."

Cardiorenal vascular disease was tabulated only when it was so diagnosed, and appeared in 0.3 men per 1000 examined. Many Forms 200 described several of the signs of cardiorenal vascular diseases but because a specific diagnosis was not made by the examining physician the defect was not coded as cardiorenal vascular disease. For example, 35.0 percent of the nephritis cases had systolic blood pressures in excess of 150 mm. Hg and 41.0 percent had diastolic blood pressures in excess of 90 mm. Hg. (Many of the individuals with high systolic blood pressures also had high diastolic blood pressures.)

Arteriosclerosis was not frequent in the age group under discussion, occurring in 0.6 men per 1000 examined. In 60.5 percent of the arteriosclerosis cases the systolic blood pressure exceeded 150 mm. Hg.

The term bradycardia appears to have been used rather broadly, since only 19.5 percent of the individuals so described had pulse rates slower than 60 beats per minute. Likewise, only 29.2 percent of individuals with arterial hypotension had a systolic blood pressure less than 100 mm. Hg.

Cardiovascular syphilis appears under the heading "Syphilis" and neurocirculatory asthenia appears under the heading "Psychoneurotic disorders."

Syphilis. Syphilis (or a positive serological test for syphilis without recorded clinical findings) was reported for 11.7 white registrants per 1000 examined, and for 176.7 Negro registrants per 1000 examined. Late syphilis and heart and nervous system complications were relatively infrequent in the age groups under discussion here. In approximately 80 percent of the 3,752 cases reported in Table 7 the diagnosis appeared to rest on a positive serological test for syphilis.

Mental and educational deficiency and mental disease. These defects have been classified into the six groups defined in special instructions issued to local boards and induction stations. 2/

Educational deficiency, the most frequent entry in Group I, has been discussed elsewhere in this bulletin. The term moron, as here used, was restricted to registrants with a mental age of less than 10 years. Individuals of higher mental age who were described as dull or sluggish mentally have been classified under the title "Dull normal." A large proportion of the entries describing mental deficiency did not specify mental age, i.e.,

2/ Medical Circular No. 1, Revised May 19, 1941, Selective Service System.

or other qualifying terms; such entries were classified as "Mental deficiency, unspecified."

Group II includes the disorders variously known as psychopathic personality, constitutional psychopathic state, and constitutional psychopathic inferiority, characterized by the record of certain types of recurrent social, sexual, or legal difficulties and by lack of adaptability for teamwork.

Group III disorders were less frequent than any of the other groups. They include individuals with abnormal fluctuations in mood and individuals who remain in a state of depression or in a state of elation.

Group IV, Psychoneurotic disorders, requires less definition. It includes two psychosomatic conditions; functional gastrointestinal syndrome and neurocirculatory asthenia. Stammering, stuttering, and tics are included in "Functional disorders of expressive movements."

Group V is typified by schizophrenia or dementia praecox, and their various manifestations.

Group VI comprises alcoholism and drug addiction.

Statements of institutional treatment for unspecified mental conditions and indefinite descriptions of mental or personality disorders were classified in "Mental defects and disorders not classifiable elsewhere."

Neurological disorders. The neurological disorder recorded most frequently was "Residuals of poliomyelitis," which were noted more frequently for white registrants than for Negroes. Next in order of frequency was epilepsy, reported for 4.0 white registrants and for 2.2 Negro registrants per 1000 examined. Numerous Forms 200 described convulsive seizures and other terms suggestive of epilepsy but not diagnosed as such; these were classified under the heading "Frequent attacks of fainting, unconsciousness, or convulsions, not further specified." The title "Progressive degenerative diseases of the spinal cord and nerves" includes such conditions as multiple sclerosis, amyotrophic lateral sclerosis, myasthenia gravis, and syringomyelia.

Musculoskeletal system. In Table 7 most musculoskeletal defects are classified in terms of the type of defect (amputation, ankylosis, atrophy, etc.) and in terms of the part of the body affected. 1/

The term "injury" as used in Table 7 includes after-effects of injury such as malunion of a fracture, limitation of function of a joint, or a scar that resulted in contracture or deformity. Acute injuries, such as unhealed fractures, were not coded and tabulated unless they were described as leading to permanent disability.

1/ Occasionally a registrant was recorded as having two or more musculoskeletal defects. In such cases the following rules were observed in selecting the defect to be coded and tabulated: (a) Birth injury, osteomyelitis, and rickets and its residuals were coded in preference to all other musculoskeletal defects; (b) If two types of defects were mentioned preference was given to the one mentioned first in the following list: amputation, ankylosis, arthritis, atrophy, shortening of an arm or leg, head or skull injury, semilunar cartilage injury, residuals of injury, and other and unspecified musculoskeletal defects; (c) If two or more parts of the body were affected, preference was given to the part named first in the following list: spine, hip, upper and lower extremities, shoulder, upper extremities, and lower extremities.

HEIGHT, WEIGHT, CHEST GIRTH, AND UMBILICAL GIRTH

Average values. The average white registrant was 68.5 inches tall, weighed 152.2 pounds, had a chest girth of 37.2 inches at inspiration and of 34.3 inches at expiration, a chest expansion of 2.9 inches, and had a waist girth of 30.8 inches.

The average Negro registrant was 68.1 inches tall, weighed 150.8 pounds, had a chest girth of 36.1 inches at inspiration and of 33.6 inches at expiration, a chest expansion of 2.5 inches, and had a waist girth of 30.0 inches.

The foregoing data are taken from Table 5; they are based on measurements of all registrants physically examined at local boards, and include men certified as available for general military service, for limited service, and as disqualified for any service. In Table 5, data are presented separately for men who were classified as available for general military service and for men who were rejected.

Table 5. Height, weight, chest girth, and umbilical girth of registrants examined at local boards, by race and by availability for military service 1/
November 1940 through September 1941

Measurement	Average			Standard deviation 2/		
	White and Negro	White 3/	Negro	White and Negro	White 3/	Negro
Height, inches						
All men examined	68.43	68.47	68.08	2.800	2.798	2.845
General service	68.49	68.53	68.20	2.678	2.667	2.749
Rejected	68.32	68.37	67.92	2.976	2.973	2.967

1/ Based on measurements of registrants physically examined in 21 selected states.
2/ Approximately 68 percent of the measurements can be expected to lie within a range of one standard deviation below the average and one standard deviation above the average.
3/ Includes all races other than Negro.
4/ Number whose height was measured.

NUMBER OF REGISTRANTS WITH SPECIFIED HEIGHTS AND WEIGHTS

WHITE REGISTRANTS PHYSICALLY EXAMINED AT LOCAL BOARDS

NOVEMBER 1940 THROUGH SEPTEMBER 1941

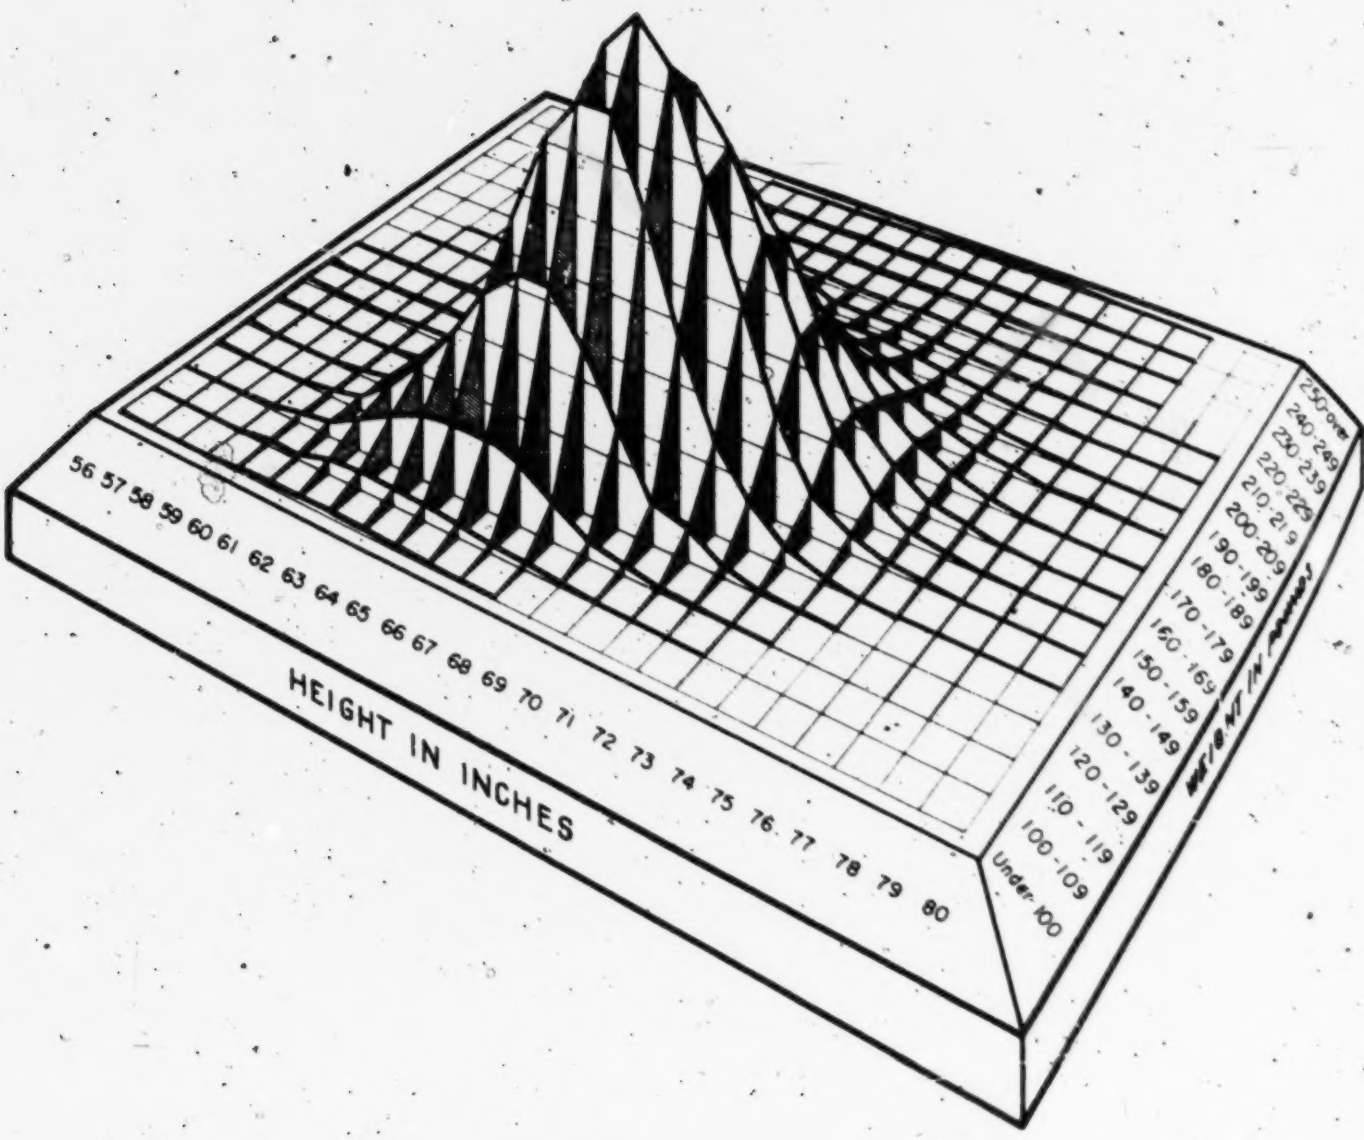

Figure 5. Three-dimensional chart showing distribution of heights and weights of white registrants physically examined at local boards. Based on data in Table 8.

The average height, weight, and chest girth of men examined at Army camps during 1917-1918 1/ are appreciably less than the corresponding data for men certified as available for general service (available for forwarding to induction stations), November 1940 through September 1941. In 1917-18, the average registrant forwarded for induction was 67.49 inches tall; in 1940-41, he was 68.49 inches tall, or an inch taller. In 1917-18, the average registrant forwarded for induction weighed 141.54 pounds; in 1940-41, he weighed 152.15 pounds, a

1/ Davenport, C. B., and A. G. Love, Army anthropology; Based on observations made on draft recruits, 1917-1918, and on veterans at demobilization, 1919. Washington, Gov't Printing Office, 1921.

difference of 10.61 pounds. In 1917-18, the average registrant forwarded for induction had a chest girth of 33.22 inches at expiration; in 1940-41, he measured 34.19 inches. Since the 1917-18 data included both whites and Negroes, the corresponding data from Table 5 have been used for comparative purposes.

Negro registrants were shorter in stature; had lesser chest and waist girths, smaller chest expansion, and weighed less than white registrants. All of these differences are statistically significant.

There was less variation among Negroes with respect to weight, chest girth, and waist girth than among whites, as shown by the standard deviations presented in Table 5. With respect to height, however, Negroes were slightly more variable than whites.

Men classified as available for general military service were taller, by 0.17 inch, than rejected men; heavier by 0.41 pound, had 0.15 inch greater chest expansion and 0.35 inch smaller waist. In addition, they were less variable than rejected men. For one thing, they were selected to meet certain standards of height, weight, and chest circumference and, for another, a number of the diseases and defects which resulted in rejection are associated with reduced chest expansion or with obesity.

In passing, it may be noted that the average height calculated from measurements of 112,314 registrants represented in the ten-percent sample of Forms 200 from 21 states, 68.43 inches, agrees within 0.04 inch with the average height of the 14,671 registrants for whom height measurements were available in a one-percent sample from the entire continental United States, 68.39 inches. 1/

Variation in height and weight. Among white registrants the height that was recorded most frequently was 68 inches and the weights that were recorded most frequently fell between 140 and 149 pounds; 3,562 of the 103,389 white registrants had this combination of height and weight. The frequency with which other combinations of height and weight were recorded for white registrants is shown in Table 8 in the Technical Appendix and is shown graphically in Figure 5. In general, combinations of height and weight close to this modal (or central) value of 68 inches and 140-149 pounds were recorded almost as frequently as the modal value, and combinations of heights and weights that differ widely from the modal value occurred relatively infrequently. 2/

Height values are distributed fairly symmetrically above and below the modal value. Weight values are not as evenly distributed and vary further on the overweight side than they do on the underweight side. The excess of overweight registrants over underweight registrants may be demonstrated by converting weight deviation to a percentage basis, as follows:

(a) 9.9 percent of all registrants were lighter than the average weight of men of their height by 15 percent or more.
(b) 78.2 percent of all registrants were within 15 percent of the average weight of men of their height.
(c) 11.9 percent of all registrants were heavier than the average weight of men of their height by 15 percent or more.

Deviations from average weight of 15 percent or more have been used for the purposes of this illustration because the experience of life insurance companies has shown that within a range of 15 percent above and below average weight the death rates are relatively low for men aged 20-29 and 30-39 at the time a life insurance policy is issued. Men who fall outside this range have higher death rates. 3/

1/ The average height of registrants included in the one-percent sample was given erroneously in Medical Statistics Bulletin No. 1 as 67.5 inches.

2/ It will be noted that registrants less than 60 inches tall have a rather wider distribution of weights than would have been predicted on the basis of the weight distributions of taller men. There is reason to believe that errors of transcription occurred in which, for example, the height of a man 5 feet 6 inches tall was recorded as 56 instead of 66 inches on the fifth line of the right-hand column of page 2, Form 200. An entry of 56, 57, 58, or 59 inches for a man qualified for general military service was plainly in error because men under 60 inches in height were not acceptable for general service. However, such inferences of error were not warranted for rejected men, and heights and weights were coded and tabulated as recorded.

3/ Data on the relation of death rates, defects, and diseases to weight deviation have been summarized by T. I. Edwards: A slide rule and two nomograms by which the percentage deviation of a man from the average weight of men of his height and age may be calculated. Amer. J. Hyg. 35:307-315, 1942.

1778

TECHNICAL APPENDIX

The tables, graphs, and explanatory text presented in earlier sections of this bulletin are largely limited to material most likely to be needed for reference purposes. This Technical Appendix presents notes on methodology and on certain special topics, such as age distribution, which it is hoped will be helpful to persons who wish to study the data critically.

REPORT OF PHYSICAL EXAMINATION, FORM 200

The data presented in this bulletin was obtained by coding and tabulating the entries recorded on Report of Physical Examination, Form 200, by local board clerks and board members, local board physicians, and medical advisory board members. Pages 1 and 2 of Form 200 have been reproduced as figures 6 and 7. To illustrate the use of the form and to facilitate discussion of coding procedures, the record of a hypothetical registrant has been recorded on the form.

When a registrant was notified to appear for physical examination the local board clerk typed in the identification data on the top of page 1 and affixed the local board date stamp in the box at the upper left. 1/

The registrant was entitled to make a statement of any defects he believed he had, and was required to sign the form. Subsequently, the registrant appeared before the local board physician and the local board dentist, if a dentist had been so designated. They examined the registrant in accordance with Selective Service regulations and recorded their findings on page 2. If a case presented unusual diagnostic difficulty such as suspected mental disease, the local board physician could request that the registrant be referred for examination by a specialist on the Medical Advisory Board. The specialist's findings were recorded on page 3 of the form, which was similar to page 2. (A fourth page carried instructions for the use of the form.) After physical examination, the local board physician entered near the foot of page 2 his recommendation concerning availability for military service.

The local board considered the recommendation of the local board physician in classifying the registrant and usually concurred in it. The local board classification, as shown in the certification section on page 1 of Form 200, has been used in preparing tables 4 and 6.

Completeness of defect data. Examining physicians were instructed to record minor as well as major defects observed in the course of the physical examination. 2/ For purposes of statistical analysis this is fortunate because it led to more complete enumeration of many kinds of defects not specifically listed in the Physical Standards.

Only a small proportion of the Forms 200 show any indication that the physical examination ended when a disqualifying defect was found. The overwhelming majority of the forms were completely filled out, including all tests and measurements for which space was provided.

Naturally there were great differences in the detail in which defects were described. Typically, terse diagnostic terms were recorded when a defect was noted and "normal" or "none" when no defect was noted. Many physicians, however, made a record of the principal findings on which their diagnosis was based, stated the cause of the condition, or made a notation to show to what extent the registrant was handicapped by the defect under discussion. Frequently statements from hospitals or sanitoria where the registrant had been under treatment were stapled to the form.

SAMPLING PROCEDURE

Local boards reported 3/ that more than 2,800,000 physical examinations had been made through September 30, 1941 and, in addition, 186,000 registrants had been deferred because of obvious defect and 143,000 for educational deficiency. On the basis of this report, a total of approximately 3,129,000 Reports of Physical Examination, Form 200, were potentially available for statistical analysis. With existing facilities it was impossible to code and tabulate each of these schedules, and so it became necessary to estimate the largest number of schedules which could be coded and tabulated and to apportion this number in such a way that each state, county, and local board would be equitably represented.

It was considered feasible to undertake analysis of approximately 300,000 schedules, which represented a ten-percent sample of all Forms 200 dated September 30, 1941 or earlier.

Reports of Physical Examination, Form 200, were arranged in National Headquarters' files by state, county, and local board. Within each local board, Forms 200 were filed by the order numbers of the registrants. A count was made of the number of Forms 200 transmitted to National Headquarters by each state, and sampling was not attempted until sufficient schedules were on file to represent 85 percent of the reported number of physical

---

1/ Even though a registrant were disqualified by the local board prior to physical examination for obvious defect or for educational deficiency, page 1 of Form 200 was filled out, and such forms are represented in this study.

2/ Selective Service Regulations, Volume 6, Physical Standards: paragraphs 3 and 5 of Standards of Physical Examination during Mobilization, MR 1-8, August 31, 1940.

3/ Accumulative Progress Report of Classification and Induction through September 30, 1941.

2057

examinations made through September 30, 1941. When this degree of completeness of the files had been attained, work sheets were made up which showed for each county:

(1) The number of physical examinations made and the number of registrants deferred for obvious defect or educational deficiency.
(2) The number of Forms 200 received at National Headquarters.

It was desired to draw one-tenth the number of forms shown in item (1) from the number of forms shown in item (2) in such a way that every Form 200 received from the county would have an equal chance of being drawn. The procedure may be illustrated by a hypothetical case.

Suppose, on the basis of reports made by local boards, that 600 Forms 200 could be expected from the local boards in a county. In the sample, that county would be represented by one-tenth of the number, or by 60 Forms 200. Suppose further, that local boards in that county had transmitted only 540 Forms 200 to National Headquarters by the time sampling began. The 60 schedules desired represent one-ninth of the number on file. Every ninth schedule was drawn for coding and tabulation. This procedure resulted in drawing Forms 200 from every local board in the county and since order numbers were assigned to registrants in an unbiased and systematic manner 1/ it also gave each examined registrant whose schedule was on file an equal chance of being drawn. In the example shown, the desired number of Forms 200 could be obtained at the first trial. Usually, of course, the number of schedules on file was not a simple multiple of the number of schedules desired for the sample. Sample ratios were so calculated that the first drawing would yield slightly less than the number of schedules that were wanted. The deficit was noted, and a second sampling ratio was calculated so that the requisite number could be drawn from the schedules remaining in the files. If a deficit still remained, a third sampling ratio was calculated and the process repeated.

Selection of the 21 states included in this study. After the sampling operations described in the preceding paragraphs had been completed, the pressure of other statistical work on Selective Service reports made it necessary to curtail the original plans for tabulation of Forms 200. Accordingly, a selection was made of states in which the total number of schedules could be coded and tabulated with available personnel and tabulating facilities. It was desirable that these states should be representative of the Nation with respect to:

(1) Geographical distribution
(2) Proportion of whites and Negroes
(3) Proportion of urban and rural residents

The states selected were:

Alabama
Arizona
Arkansas
California
Colorado
Connecticut
Florida
Georgia
Indiana
Iowa
Kansas
Kentucky
Maine
Maryland
Minnesota
Montana
Oklahoma
Oregon
Pennsylvania
Utah
Wisconsin

1/ The process by which order numbers were assigned to registrants has been clearly and briefly described in Chapter VIII of Selective Service in Peacetime, pages 84-99. Details may be found in Volume Three of Selective Service Regulations.

Local Board No. 1	01
Thornton County	001
SEPTEMBER 5, 1941	001
County Court House	
Thornton, Maryland	
(STAMP OF LOCAL BOARD)	

REPORT OF PHYSICAL EXAMINATION

Doe (Last name) John (First name) Thomas (Middle name) 158 (Order No.) Race White

Occupation Public school janitor

Permanent address Thornton (Town) Thornton (County) Maryland (State) [Urban ☒ Rural ☐] English (Mother tongue)

Birthplace Platteville (City, town, or county) Maryland (State or country) Birth date October (Month) 10 (Day) 1914 (Year)

†Place "X" in box opposite urban community of 2,500 population or greater; otherwise place "X" in box opposite rural.

STATEMENT OF PERSON EXAMINED

Do you consider that you are now sound and well? No If not give details Heart trouble, bad eyesight

What illnesses, diseases, or accidents have you had since childhood? Heart trouble following rheumatic fever at age 5

Have you ever had any of the following? If so, give dates: Spells of unconsciousness, convulsions, or fits No

Gonorrhea No Sore on penis No

Are you addicted to the use of habit-forming drugs or narcotics? No

Have you ever since childhood wet the bed while asleep? No

Have you ever raised or spat up blood? No If so, when?

When were you last treated by a physician, and for what ailment? 1919 - rheumatic fever

Have you ever been under treatment at a hospital or asylum? No If so, when, and for what ailment?

I CERTIFY that the foregoing questions and my answers thereto have been read over to me; that I fully understand the questions, and that my answers thereto are correctly recorded and true in all respects.

I FURTHER CERTIFY that I have been fully informed and know that making or being a party to making any false statement as to my fitness for military service renders me liable to punishment by fine and imprisonment.

Place Thornton, Maryland

John Thomas Doe
(Signature of person examined)

Date September 5, 1941

This local board finds that the person named above is:

~~Qualified for general military service.~~

~~Qualified for limited military service.~~

Disqualified for military service because of Enlarged heart and poor vision

Date September 10, 1941

W. W. Wollingrath
(Member of Local Board)

Application is hereby made to have the registrant sent to a Medical Advisory Board for further physical examination because of

Date

(Signature and title)

This Local Board respectfully refers the registrant named on first page hereof to Medical Advisory Board No. for further examination in

Date

Member of Local Board.

D. S. S. Form 200 Report of Physical Examination.

Page 1

Figure 6.

2059

PHYSICAL EXAMINATION BY PHYSICIAN FOR LOCAL BOARD

1. Eye abnormalities: Convergent squint, with amblyopia
2. Ear, nose, throat abnormalities: None
3. Mouth and gum abnormalities: None
4. Teeth (Examinee's) — Right: X 7 6 5 4 3 2 1 / 16 15 14 13 12 11 10 9 — Left: 1 2 3 4 5 6 7 8 / 9 10 11 12 13 14 15 X (Strike out those that are missing; circle those that may be restored)
5. Skin: Clear
6. Varicose veins: None
7. Hernia: None
8. Hemorrhoids: None
9. Genitalia: Normal
10. Feet: Pes planus, first degree. Bunions, both great toes.
11. Musculo-skeletal defects: Considerable stiffness of knees
12. Abdominal viscera: Normal
13. Cardiovascular system: Enlarged heart. Loud mitral murmur
14. Lungs, including X-ray, if made: Normal
15. Nervous system: Reflexes, pupillary: Normal patellar: Normal
16. Endocrine disturbances: None
17. Results of laboratory examinations, when made: Kahn negative
18. Remarks on defects not sufficiently described above: Rheumatic heart disease. History of rheumatic fever in childhood. At present has loud systolic murmur over mitral area, transmitted to the axilla. Dyspnea on exertion.
19. Summary of defects in order of importance, impression of physical fitness:
    Rheumatic heart disease
    Amblyopia
    Stiffness in knee joints

Vision: with glasses
- Right eye 20/ 30 20/20
- Left eye 20/ 200 20/200

Hearing:
- Right ear 20/20
- Left ear 20/20

Height: 65½ in
Weight: 127 lb
Girth (at nipples):
- Inspiration 32½ in
- Expiration 30 in

Girth (at umbilicus): 29 in
Posture: Stooped
Frame: Slight
Color of hair: Brown
Color of eyes: Brown
Complexion: Dark
Pulse: ‡
- Sitting 80
- After exercise 104
- 2 min. after exercise 86

Blood pressure: ‡
- Systolic 130
- Diastolic 82

Urinalysis:
- Sp. gr. 1.024
- Albumin Neg.
- Sugar Neg.
- Microscopic‡
- Other data‡

‡ When required.

I CERTIFY that I have carefully examined and reviewed the record of the examination of the person named herein and that it is my judgment and belief that he is:

~~Qualified for general military service~~
~~Qualified for limited military service~~

Disqualified for military service by reason of: Rheumatic heart disease; defective vision.

Place: Thornton, Maryland
Date: September 5, 1941

Jerome A. Johns, M. D.
Examining Physician.

I hereby appeal from the finding of the above Local Board to the Board of Appeal because of .....

Date .....

(Signature of registrant)

Figure 7.

CODING

Discussion of the coding of data entered on page 1 of Form 200 falls outside the province of this bulletin.

With certain exceptions, such as those mentioned under "Priority Chart," every defect described in words on page 2 was included in tables which show the incidence of all recorded defects.

Physicians were free to describe defects in any language they chose. Usually, precise terminology was used but frequently idiomatic expressions and lay language were employed. Coding manuals were made up by copying and classifying all of the entries found on approximately 30,000 Forms 200, describing physical or mental defects. After coding and classifying these entries two manuals were set up. One, used by coders, listed key words and permissible modifiers in alphabetic order, together with the code number to be assigned. An example follows:

802 Bow legs (due to) rickets (childhood, during childhood, old, possibly, probably)
251 Bradycardia, sinus
662 Brain abscess
648 Brain, concussion (of) [May include one or more of the following]

convulsive disease	personality changes
fracture of skull	post-traumatic
marked	recent
mild	severe
moderate	symptoms

648 Brain injury, sequelae (of) (old, severe)
652 Brain stem disorder, encephalitis
639 Breakdown, nervous
777 Breastbone deformity

Each of these three-digit codes, 802,251,662, etc., designates one of the 515 titles listed in Table 7. If a coder could match, word for word, entries on Form 200 with terms listed in the manual, the indicated code number could be assigned. Terms listed within parentheses might or might not be present and would not affect choice of code number. Instructions to coders were placed within brackets [ ]. Except for a few types of defects such as tuberculosis and flat feet, no attempt was made to code the stage or degree of the defect. This greatly simplified the problem of coding. If a coder were unable to match a physician's entry with terms listed in the coding manual it was brought to the attention of the section supervisor. Difficult cases were referred to the Medical Division and when the situation warranted, the advice of leading specialists was obtained.

When every named defect recorded on a particular Form 200 had been coded in this way the form passed to a verifier, who looked up each code number in a manual which listed all the terms to which that code number could be applied. If the physician's entry could be found in the verifier's manual by looking up the assigned code number, the coding was considered to be correct. If the entry could not be matched up with terms in the verifier's manual, the supervisor of the verifying section was notified and the correct code was obtained, as noted above.

PRIORITY CHART

Frequently information entered in one part of the physical examination form was duplicated by information entered elsewhere on the form in different words and it became necessary to set up safeguards against counting the same condition two or more times for a single man. Figure 7 provides an example. Rheumatic heart disease is reported in the physician's summary in item 19, and in item 18 the examining physician has listed the evidence on which he based his diagnosis. Since the existence of these signs and symptoms is implied by the diagnosis they should not be tabulated in addition to rheumatic heart disease.

A procedure which was set up to minimize duplication of this kind involved (a) assigning a code number to every defect recorded in words on the physical examination form and (b) checking the code numbers against a "priority chart" to ascertain which would best describe the registrant's condition.

Thus, in the example shown in Figure 7, code numbers would be assigned to the entries: "enlarged heart," "loud mitral murmur," "At present has loud systolic murmur over mitral area, transmitted to the axilla," and "Dyspnea on exertion," as well as to "Rheumatic heart disease." After verification the coded form would pass to a clerk who would review each coded form in terms of the priority chart which listed, in terms of code number, 28 major subdivisions of the defect code, corresponding to organic systems of the body, e.g., eyes, ears, teeth, etc., or to diseases, e.g., tuberculosis, syphilis, etc. Within each of these 28 major subdivisions of the code, defects were arranged in order of the preference to be given when a choice had to be made between two or more named defects. Diagnoses, which imply the existence of certain signs and symptoms, were at the top of the list and signs and symptoms (often reported by themselves) were at the foot of the list. Thus, only the term which was most descriptive of the registrant's condition was finally transferred

to a punch card.

Terms that describe the end result of a pathological condition have, in general, been given preference over terms that describe the cause. Thus in the entry "Convergent squint with amblyopia," the end result amblyopia was selected as the term describing the registrant's eyes instead of convergent squint, the probable cause.

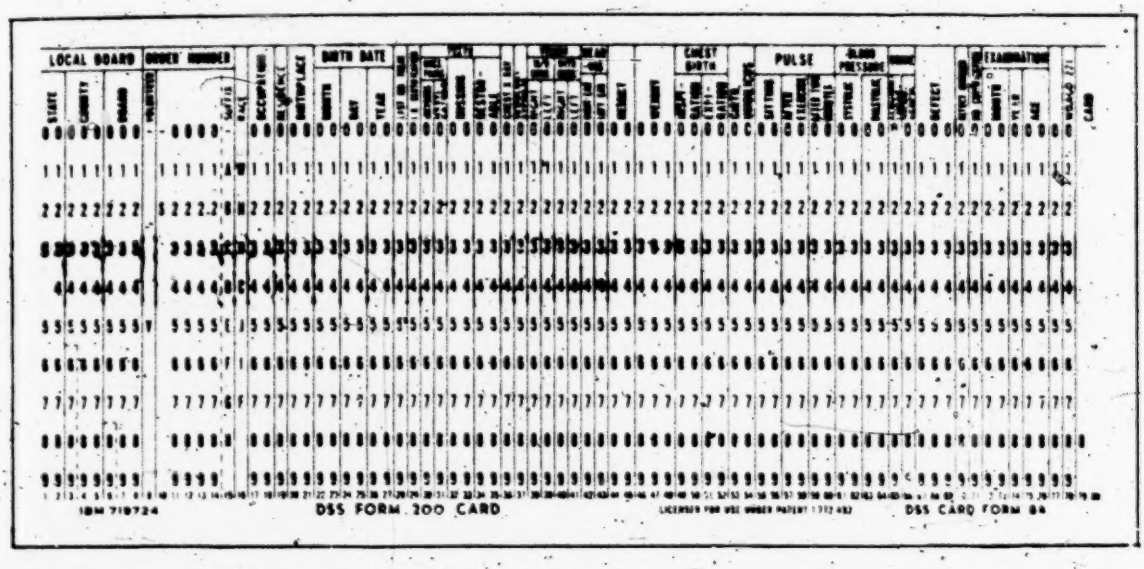

Figure 8. Punch card to which coded data were transferred from Form 200, Report of Physical Examination.

PUNCH CARD

A specimen of the punch card to which coded data were transferred is shown in Figure 8. The column headings printed on the card indicate the items of information that are available for tabulation. Subsequent bulletins will deal with other aspects of the data. A separate card was punched for each defect described for each man. The defect listed first in item 19, "Summary of defects in order of importance" was identified by an X-punch in Col. 70 so that the cause of rejection could always be ascertained.

to a punch card.

Terms that describe the end result of a pathological condition have, in general, been given preference over terms that describe the cause. Thus in the entry "Convergent squint with amblyopia," the end result amblyopia was selected as the term describing the registrant's eyes instead of convergent squint, the probable cause.

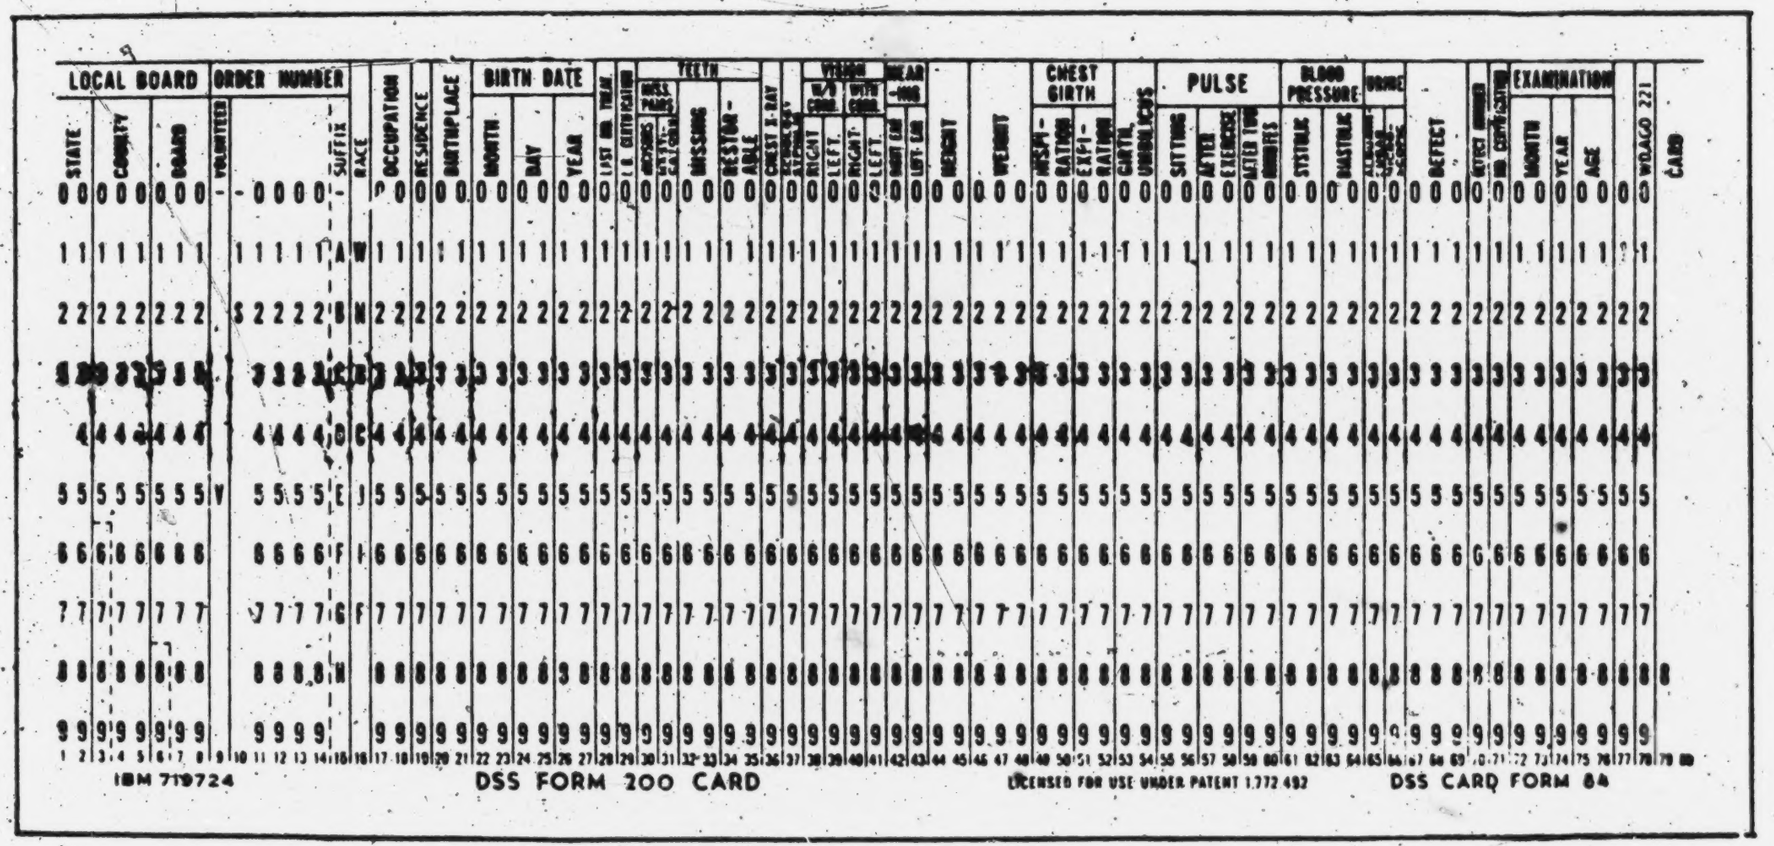

Figure 8. Punch card to which coded data were transferred from Form 200, Report of Physical Examination.

PUNCH CARD

A specimen of the punch card to which coded data were transferred is shown in Figure 8. The column headings printed on the card indicate the items of information that are available for tabulation. Subsequent bulletins will deal with other aspects of the data. A separate card was punched for each defect described for each man. The defect listed first in item 19, "Summary of defects in order of importance" was identified by an X-punch in Col. 70 so that the cause of rejection could always be ascertained.

AGE DISTRIBUTION

The data on rejection rates in relation to age presented in figures 2 and 3 and in Table 2 have been derived wholly or in part from the data of Table 6. Table 6 shows the number of men in each year of birth by race and by classification after physical examination. Several general features of these data will be discussed briefly.

Figure 9 shows, by the height of vertical bars, the percentages of white and of Negro registrants who were born in specified years. The shape of the upper boundary of these bars is influenced principally by three factors: (1) Men born after July 1, 1920 were not liable for military service until after July 1, 1941, the date of the second registration, and a large proportion of the ca shown as born in 1924, 1923, 1922, 1921, and to a certain extent, 1920, were volunteers who applied for enlistment through local boards. (2) There is a gradual decline in the heights of the bars fro 1918 on because, with advancing age, a larger proportion of men were granted deferment on grounds of dependency, essential occupation, and other reasons discussed in connection with Figure 1. (3) After July 1, 1941, men over 28 were deferred. 1/

Average age. The average age of both white and Negro registrants was 26.0 years, reckoned from year of birth as given in Table 6 to April 1, 1941, the date when half the registrants included

Table 6. Classification of registrants after local board physical examination, by year of birth and by ra November 1940 through September 1941 1/

1/ In the columnar headings, I-A designates registrants available for general military service; I-B, registrants available for limited military service; and IV-F, registrants disqualified for military service.
2/ Includes all races other than Negro.
3/ Excluding 266 registrants whose classification was not shown.

1485

PERCENT DISTRIBUTION, BY YEAR OF BIRTH, OF WHITE AND NEGRO REGISTRANTS PHYSICALLY EXAMINED AT LOCAL BOARDS NOVEMBER 1940 THROUGH SEPTEMBER 1941

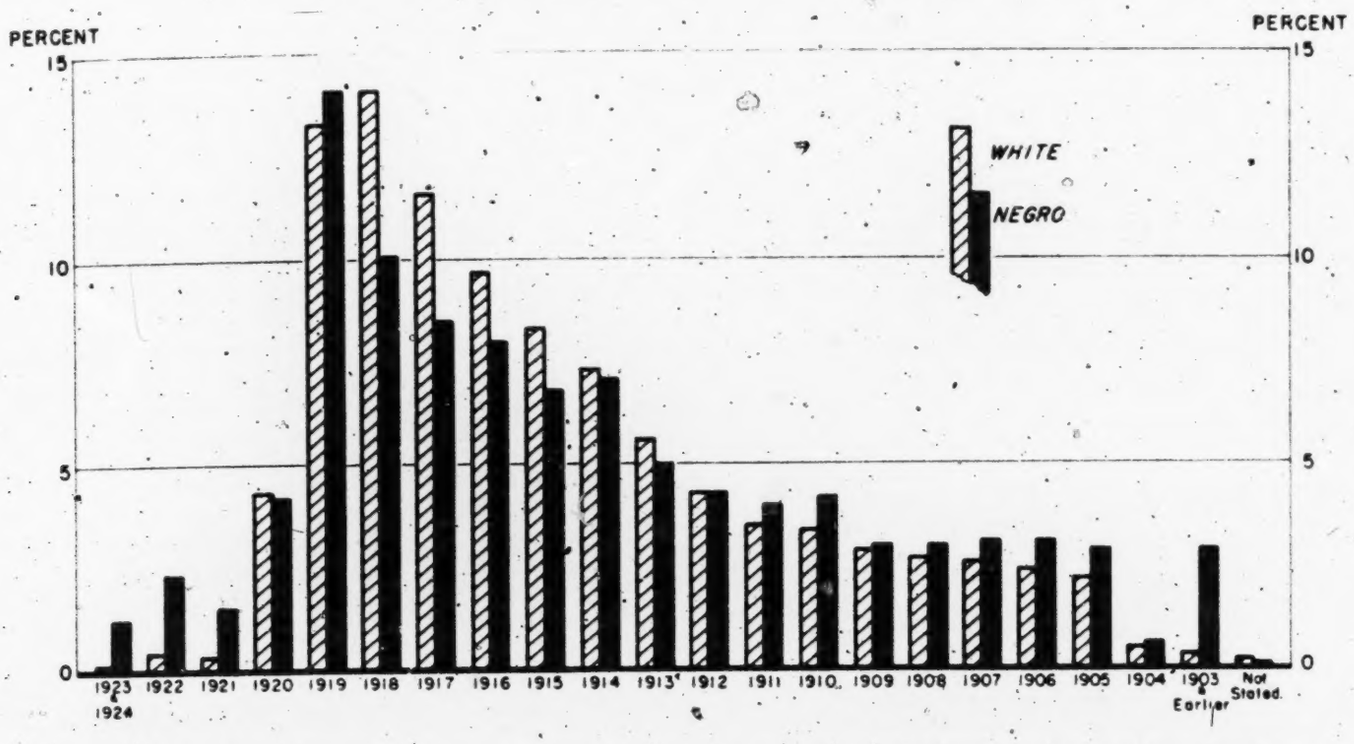

Figure 9. Bar diagram showing percentages of white and of Negro registrants who were born in specified years. Based on data in Table 6.

in this study had been examined. For the period November 1940 through May 1941 the average age of registrants called up for local board physical examination was 25.8 years.

The average age of over 3,000,000 applicants for War Risk Insurance in World War I was 24.9 years. 2/

Age scales on Figures 2 and 3. The data dealing with classification in relation to age in Table 6 and in releases of the Office of The Adjutant General were expressed in terms of year of birth rather than in terms of completed years of age at time of examination. Tables and graphs were constructed and labeled accordingly. For convenience in interpreting these graphs an age scale has been added showing the age attained by April 15, 1941, the date when half of the registrants included in this study had been examined.

1/ A table and a set of bar diagrams showing the age distribution of inducted registrants, November 1940 through November 1941, in relation to year of birth appear on page 235 of Selective Service in Peacetime. Data showing classification after local board examination in relation to age for the period November 1940 through May 31, 1941 appear on pages 104 and 211 of Selective Service in Peacetime.

2/ Similar data on the age distribution of soldiers in the Civil War and in World War I are presented on pages 64 and 65 of Army anthropology: Based on observations made on draft recruits, 1917-1918, and on veterans at demobilization, by C. B. Davenport and A. G. Love. Government Printing Office, Washington, D. C., 1921.

REFERENCES

There are a number of other sources of statistical information on the incidence of illness and defects in the general population with which the data of this bulletin can be compared. Comparisons are not always simple because the fact that each set of data has been obtained under different conditions affects the magnitude of the rates and even determines whether or not a particular illness or defect will be counted at all. Among differences that have to be considered in such comparisons are:

(1) Age distribution and socio-economic status of the persons under study differ from study to study.

(2) In some of the most extensive surveys the persons under study were not examined by physicians; enumerators recorded information on recent or current illness and disability.

(3) In studies in which physicians have obtained all the information tabulated there are differences in objectives, physical standards, and in the availability of X-ray equipment and other laboratory facilities, which have a bearing on the findings.

The list of references that follows includes the principal publications which present statistical summaries of the results of investigation of the general health of fairly large numbers of relatively unselected populations of adults. Many publications dealing with the incidence of specific diseases, such as tuberculosis, have not been included because they can be found easily by reference to the standard indexing and abstracting journals. In addition, a number of Directors of Student Health in large colleges and universities have prepared statistical summaries of the incidence of defects found on examination of students. These are usually in mimeographed form and presumably for limited distribution.

DEFENDENT'S EXHIBIT 7

How To Get Well-
And Stay Well

1105

1610 Lake St., Bakersfield, Cal.,
May 11th, 1946.

Mr. E. R. Fillion,
Nutrilite Representative,
Bakersfield.

Dear Mr. Fillion:

In answer to your inquiry as to my progress in using your product for my Arthritis, I thought you might be interested in learning something about my case.

I have had rheumatism almost all my life, beginning with rheumatic fever at age 7.

During the past 15 years I have had to use crutches constantly, and I have gone to almost every doctor in California and Oklahoma I have been told might help me with my rheumatism. Have also had many baths (mineral), as well as two operations to remove the calcium from my joints. Altogether I have spent 4 years out of the last 15 in bed. All my efforts to recover my health have seemed to be of little if any avail.

After 9 months in bed, with great pain from my swolen joints and muscles, and with a feeling that nothing could help me, when you came along 4 months ago and told me what your Nutrilites might do for me. I was willing to try anything, as a last resort, so started with you.

I did not take Nutrilites long before feeling a slight change; to-day I am a different person entirely. I have been sitting up for a month, have walked a little, unassisted, and can now get out and sit in the sunshine. I have also been able to ride in my brother's car, getting in and out of it with a little help. My joint and muscle pains have almost entirely gone.

I am now looking forward, with high hopes, to getting back to work within the next 2 or 3 months, something I haven't been able to do for years.

You tell me some people think your product costs too much. I have spent several thousands of dollars for treatments, with no benefits, so the value of Nutrilites to me can never be measured in dollars and cents. To me no price would be too high.

You may use this letter in any way you wish, if it will be the means of helping other poor sufferers.

Sincerely yours,

Ermon Jones

Dear Mr. Stivers:

Just a line to tell you how we have benefited by Nutrilite. My husband had colon trouble for eighteen years and it has not only helped this condition, but he had colds all Winter long, and has not had a single cold since taking this treatment.

I was troubled with gas, short breath, and could not eat much at night. Now that has all disappeared. We can't say enough for Nutrilite.

You may use this letter in telling others about your product, if you wish.

Yours truly,

Mrs Hickey Putnam

May 22, 1946

My dear Mr. Mytinger:

I wish to tell you and others what Nutrilite Products have done for our little girl, Carole. She is four years old and has had eczema very severly since she was seven months old. We have consulted many specialists and have tried numerous suggestions, but to no avail. Her appetite became poor, she had no pep and spent many sleepless nights. She appeared to be anaemic and frail. Then, Mr. Mytinger, you came along with your wonderful products and saved the day. Carole has been on Nutrilite for six months and she isn't the same child. Her Eczema is practically gone now, she has an enormous appetite, her color is good, she is gaining weight and above all, her energy is everlasting. She plays all day long and no longer requires an afternoon nap. She sleeps exceptionally well at night.

I'm looking forward to the day when my whole family can take Nutrilite Products.

Sincerely,

Mrs. James P. Johnson

Nutrilite Products Company have my permission to use this letter

Long Beach 5, Calif.

Dear Mr. Mytinger;

I have been taking Nutrilite for six months and it has done great work for me.

My stomach was in such bad condition that I dreaded to eat a meal. I had gas and sour stomach all the time, and dizziness until I could not work on a scaffold without holding on, and I would get so tired I just felt like I could not last the day out.

But after three months my ailments are gone and I can eat anything and I have no more gas or sour stomach. My stomach is in the best of condition and my dizziness is gone . I can now climb ladders all day and don't get tired, and that is more than all the Doctors have done for me.

My arms have been lame for 12 years and they are getting better now.

Yours truly,

E. R. Ackley

Dear Mr. Stowers —

After using Nutrilets for five months, our five year old daughter has not only built up a resistance for a tonsilectomy but her tonsils show a decided decrease in size. She has suffered a slight loss of hearing due to her diseased tonsils and an operation may still be necessary but maybe her ears will improve too. I have great faith in Nutrilets —

Very truly
Anna Lappan Litell

Dear Sir:

Over the previous eight months, I have been taking the "Nutrilite" course of treatments that we got from you, and have been greatly benefitted by their use, in regard to my Hay fever and also my premature meno pause. You may use this letter, if you care to do so. My husband too, has received quite gratifying results, he had been a sufferer with sciatica + until taking up the Nutrilite mode of treatment had found no relief, and now he seems to have discovered the right thing to control this trouble.

Sincerely

Edna Mateska

Mr. B. M. Meyer
Nutrilite Products
Santa Monica, Calif.

Dear Mr. Meyer,

Because your product has done so much for my children as they became teen age, I felt I should write you a little note of appreciation.

When you called on me after your lecture, I had some definite problems in my children's health to discuss, as you remember. Gordon, 12 years old, wasn't growing as he should and was so thin. He complained of nausea in the morning and wouldn't eat his breakfast. He was listless and slow to mind. Frances, who was 14, had constant colds and sore throats, and just couldn't keep up with her school mates.

I had taken both of them to a child specialist. I was told Gordon needed hydrochloric acid tablets for an allergy we couldn't discover, and Frances was getting shots. They had been under this treatment for several months, with practically no improvement, when I was introduced to Nutrilite.

I took a child's course for them, and within a few weeks we noticed a pick-up; Frances particularly felt more pep. Gradually the colds and sore throat trouble occurred less frequent, and the boy, though it took several months, began eating breakfast and filling out and growing. He is so proud of the 2-1/2 inches he has grown the last year.

I've passed them their rations daily, with a few exceptions, for over a year, and I'm glad I stuck with it because now everyone tells me how well the children look. If this letter would help another mother to appreciate and use your very fine product to build her child's health, I'd be glad for you to use it.

I guess you've got a steady customer in me because I wouldn't think of quitting when it keeps them in such good condition.

Very sincerely yours,

(Mrs) Elsie McNabb

Have no objection to your permission to use this letter as a testimonial in any way you wish.

Dear Mr. Stivers:

My boy Zan has been on Nutrilite just six months now and he has only had one bad attack of Asthma in that time. Before that time he had at least two a month and I could never build him up as he had one cold after another. He was so thin and in very poor health simply because he had Asthma so much. Now he takes part in school activities and is a new boy. Before, his teacher would tell me he looked as though he were so tired she felt sorry for him, and he didn't enter into the spirit of things. Now he has gained and is filled out and is ready for anything. He is ten years old. He first had Asthma when he was six and we have tried everything, even a new shot for Asthma, but until we began Nutrilite he was the same. Now he has a good appetite and is not a Doctor's care. I know Nutrilite has worked wonders for Zan and I just wanted to thank you for telling us about this product.

Yours truly,

(Mrs.) Hyelvin Olson

You have my permission to use this letter that others might learn.

1113

Ontario, Calif.,

July 1, 1943.

Just a few lines to say how thankful I am for better health than I have had for so many years. I have tried many doctors. About two years ago they told me I could never expect to be any better -- that I should be glad to be able to move around the house a little. The doctors said I should not try to go out any more.

Soon after that I suffered a stroke that left me unable to walk without help for some time.

About 10 months ago we heard Mr. Stivers' lecture. My husband said he was sure Nutrilite would help me. I have been taking it ever since.

Now, to make a long story short, I have been walking from 8 to 16 blocks in the morning and help quilt all day and feel fine after, something I had not done for years. I thank God and Nutrilite for my better health at the age of 62 years.

Mrs E. M. Daiken

Mrs. E. M. Daiken

448 Sadler Ave.,
Montebello, California.
March 15, 1946.

Dear Mr. Stivers,

I want to tell you how wonderful I feel after having been on Nutrilite, for about five months.

When you first called on me my back and neck were so stiff I could hardly move them and then only with agonizing pain. I had changed climates, gone to the best specialists and had spent many hundreds of dollars trying everything that I heard about, hoping that something would help me, but to no avail.

My husband heard about NUTRILITE from his employer who had attended one of your health lectures. When you came to see me at his request, I was skeptical and knew that nothing would help me because I had become so discouraged. However to please my husband I said that I would try it.

In three months time I had become so much better, every one who knew me were astonished and I myself could not believe I was the same person.

I have very little pain and can move my neck freely. I am not so nervous, my terrific headaches are gone and I truly feel like another person.

My husband, who was very nervous. has been on NUTRILITE as well as myself and he is much better. We have also recently put our young daughter on this wonderful product.

I can certainly heartily recommend NUTRILITE for those who are troubled with Arthritis of ~~the spine, or anything~~ else as a number of my acquaintances are on NUTRILITE for various afflictions and they are receiving so much good from it.

My husband and I have decided that we would rather "pay Nature" by giving her the building material she needs to keep us going strong than by trusting to chance.

Very gratefully yours,

Ollie Lewis

Mrs H. H. Stewart
Nutrilite Products
880 Roswell Pomona Calif.

Dear Mrs Stewart:

Because your product has done so much to improve my health I feel I should write a note of appreciation.

When I heard of your products I had been to several doctors and none had helped to relieve my suffering which was a severe hurting in my back and down my limbs. I would have cramps and drawing in my limbs for a week at a time couldn't straighten them.

I took a course of Nutrilite Ration No 1. and within a few days I noticed the pains were leaving in my back and limbs. I could work all day without feeling tired. I am taking my second course of these products and my wife is taking it with me so you see we are convinced of its great wonders.

If you care to use this letter to show others what your product has done for me I'd be very glad.

Sincerely yours
Erwin Bunch

Dear Sir

This is to inform you of the wonderful results I obtained from the use of your product Nutrilite Capsules.

In February 1944 I became very ill with asthma, after an attack of influenza. I began taking your product and continued for six months, and was very much improved. Later my illness returned and I began taking Nutrilite capsules again in March 1945 and continued for a year. I am feeling fine now, have had no attacks in many months.

I would highly recommend this product to anyone so afflicted

Yours truly,

Mrs Oscar Hanneman

Riverside, California

Dear Mr. Stivers:

As the days go by and I feel so much better, I want to take this opportunity of telling you how glad I am to have found so effective a course as the Nutrilite Products. I apparently had no serious organic trouble, yet I realized something was lacking, preventing my enjoying a fully active life. I was always so tired.

In my office work I use my eyes steadily. I was tired and run down and felt I was in need of a refraction and perhaps new lenses. I delayed doing anything about it, meantime I started taking the Nutril Products and since then I have not felt the need of new glasses. In other ways I have noted a marked improvement. I feel I really can't afford to be without your products.

Very truly yours,
Pearle M. Freeman

January 13, 1946

Mr. D. L. Stivers.

Dear Sir:

Four months ago, as you must well remember, I was a physical wreck. I was on the verge of a nervous break down, and all the ailments which I have had through the years past seemed to flare up,--namely—liver and gall bladder trouble, constipation, bleeding piles, colitis, menstrual difficulties, an ear and throat condition--for which three specialists, an M. D. , a dentist and a Chiropractor could do nothing; arthritis in knees, elbows, wrists and knuckles, eyes getting worse, touches of sinus, kidneys and bladder acting up, losing weight fast, and to say nothing of small aches and pains, and a lump that was forming on my lower jaw.

Now after taking Nutrilite over a period of four months most of these troubles have cleared up to where they are unnoticable and all others are improving fast.

In all sincerity, Nutrilite was a God send. All I hoped for was help for my nerves but miracles happened , it seems. My only regret is that I cannot tell the whole world about it.

If Ponce De Leon lived today, I could tell him where to find the Fountain of Youth—Nutrilite!

My husband has had a decided improvement in prostrate and kidney trouble. Also, our five year old boy used to get up for toilet twice a night, now rarely gets up....after only a few weeks on Nutrilite.

Very sincerely and thankfully,

Mrs. Edward F. McKernan

2095 FOREWORD

For eleven years a certain Laboratory had been preparing a food supplement. This food supplement enabled people to have a fully nourishing diet, and consequently to eliminate all kinds of deficiency diseases from Arthritis to Asthma, and from Migraine Headaches to High Blood Pressure.

In 1945 many new people came into the organization, and wished to know just what the food supplement would do. So all the representatives who had been supplying the product to people all around Los Angeles for from three to ten years, were gathered together at a luncheon meeting. The Chairman got them started talking about the results their customers had obtained, using the food supplement, and the stenotypist took it down on her machine.

The case histories in the following pages are substantially as reported at the meeting, only small changes having been made for the sake of clearness or brevity. All of these cases, told about in this book, can be investigated and substantiated, together with many more too numerous to be included.

2096 HOW TO CHEAT DEATH

The Educator looked around the luncheon table at the other members of the organization, and at the girl with her stenotype machine ready to take down all that was said.

"You want to know about cheating death?" he said. "Listen."

"One day Mrs. B. —— asked me to call on a friend of hers, a man who, she said, was just waiting to die. I said, 'I'd rather not, if you don't mind—he'll just think I'm trying to sell him something.' 'No,' she replied, 'It's all right. I've told him all about your product, and he wants to see you.'

"When I called, he was lying on the davenport—a sick, underweight, emaciated old man. He told me about all the money he had spent for X-ray pictures and doctors and sanitariums. He said that five specialists had just thrown up their hands and had said, 'We don't know what is wrong with you, but the best thing you can do is go home and take it easy. You have about two weeks or a month to live.'

"I said, 'Mr. J. ——, it isn't right to make such a prediction about a person. Nobody in the world can tell what Nature can accomplish. If you give her a whole set of tools to pick any and everything she needs to work with, she will take care of you.

"What will happen in your case? Nobody knows. And how fast she will work we don't know, but we know she will do all she can, when given the right materials to work with. So I won't make any

predictions. We can't be sure our product will relieve all
2097 your ailments. That is Nature's problem. But we can give her all she needs, and then let her do the rest.

"Anyway, he started using our product, and I dropped back about six weeks later, and he told me he had gained seven pounds.

"I didn't see him again for six months, and when I called that time he was up to his normal weight and had just finished working five days and most of five nights. As you may imagine, he was a very happy man.

"But, as I say in my lectures, you don't have to die, or to be near death, to suffer," continued the Educator. "Take migraine for instance. The worst case of migraine I ever encountered was a young girl. She had had these headaches for a long time—from birth, I guess.

"When her headaches would come on she was given sleeping powders, and for two or three days she would just try to sleep it off. At the end of that time there were heavy black patches under her eyes, and you could see just by looking at her, how she had suffered.

"When the doctor who had administered the sleeping powders died, the girl came to me and said, 'What shall I do? I can't stand the pain!'

"I said, 'Why not give Nature the tools and let her go to work?' I gave her a capsule then and there, and told her also that I didn't know whether it would take 24 hours or 24 weeks, but that if she would give Nature what she needs, Nature would do the rest.

"So the girl began using our product (#15). Two years later she told me that in that time she had had two slight headaches—but no more migraine headaches."

2098 "Your mentioning the sleeping powders," said one of the representatives, "reminds me of Mrs. F.——. Here was one of those cases where the person is ill, but with no particular symptoms that make it easy to diagnose. A general degeneration of the whole system best describes it.

"A friend of hers had been using our product, and told her about it, so she sent for me. When I first saw her she was weak and ill, lying on the couch in the living room. She was able to take only a few steps around the house, and was almost living on sedatives. She hoped to live only a few months at the most.

"She was a teacher, and intelligent. The reasonableness of our method of providing Nature with the right materials appealed to her. So she started with our product at once.

"One week later she called me on the phone, saying she was feeling better. Within five weeks she took a walk of two blocks. Not long ago I took her down town in my car, and she is well on her way to complete recovery. And she is one of my best boosters for our product."

"There was a lady in Long Beach," said Mr. Rehnborg, "who had almost the same experience. She also didn't have any specific ailment, except possibly Anemia. The doctors couldn't put their finger on anything in particular, but they said she wasn't going to live more than a few months.

"Her husband would carry her out to the garden swing in the morning, and bring her back into the house at night, and she just waited to die. A friend told her about our product, she sent for one of our representatives, and he went to see her.

2099 "She was so eager for help she would hardly listen to our explanation of the way Nature works. She started on the course. In about six weeks she was up and about and so enthusiastic about our product she just had to tell everyone. She continued to gain steadily, and for the past eight years has been one of our most enthusiastic representatives. She says she is living on borrowed time, since she was given up for dead; and now considers herself a missionary.

"Speaking of sleeping powders," said the Chairman, "did you see the article in the Readers Digest for May, 1945? The title is *Sleeping Pills Are Not Candy!* You should all read it. It tells about the harm that comes from the free use of sleeping powders that is so common now."

"This has nothing to do with sleeping powders, but it does have to do with cheating death," said another representative. "I called at a home on an errand, and chanced to meet an old man of 81. He had never been sick a day in his life, he said, until he began to get weaker and weaker, and finally was unable to do anything.

"I happened to catch him just after he came back from his doctor's office. He looked so bad, and seemed so sad, I couldn't help but talk to him. He was worried about the blood transfusion the doctor had ordered for the following day. He was sure he was going to die.

"I said, You may need a blood transfusion all right, but it seems to me that if you put good blood into your body, whatever is making your present blood bad will continue to act; and in a few days you'll be right back where you were. Why don't you do this: phone your doctor and see if the transfusion could be postponed for a couple weeks, without harm. If so, you could use our product and

2100 give Nature a chance to do her work. And you could still have the transfusion later, if you need it.

"So the transfusion was postponed for two weeks, and the old gentleman started using our product. Three days later—can you imagine that?—three days later he phoned to tell me he felt ten years younger. I said, 'You haven't any right to feel better so soon, but I'm delighted.' He continued to use our product, and one month later instead of a drooping old man, he was smiling, pleasant and peppy. His blood count was improving, and the doctor advised him to continue with our product.

"The next time I saw this man was six months later. Now remember, he was 81, and six months previous he was almost dead. When I arrived; do you know what he was doing? He was mixing concrete and putting in a driveway and a four foot wall!"

"How about constipation?" asked one of the new representatives. "Some people suffer a lot with that."

"I tell my people," replied the Educator, "and I always say in my lecture, that if they will give Nature the tools and let her work on it long enough she will correct the condition, and they will be regular. But it takes time, of course, because our product isn't medicine, and the body cells have to change. So I tell them to keep on with any laxative they are now using, but to take as little as possible. As the body rebuilds they can use less and less of the laxative, and in a few months they will not need any at all.

"I had one man who said to me once, 'You are a great big liar!'

Naturally I was surprised. He continued, 'I took your product
2101 and after the first week I have not had any constipation.'"

"Here is something most people don't know," said Mr. Rehnborg, the biochemist. "The bowels can be flushed by drinking three or four pints of a solution made as follows: to each pint of very warm water add a level teaspoon of salt, and put in lemon to taste. This is the same proportion of salt to liquid as occurs in the body, so the water goes right through and you get results in about 40 minutes. If a person has constipation, and he has to have something to help his bowels while our product is building him up, that is good to take."

"I don't want to change the subject, necessarily," said another representative, "but I happen to be most interested in 'psychological' cases. I majored in Psychology in college, you know, and I thought I would become a consultant.

"As I studied Psychology it became evident that people can have two kinds of psychological troubles. The first type is a matter of bad habits. Examples are: wrong habits of thinking, poor methods of solving problems; habits of introversion, submission, dependence and tantrums; inferiority feelings, procrastination, the habit of rush and hurry and tension, and poor social or business habits. For these the person should have training from a good consulting psychologist.

"Along with these bad habits, and aggravating the condition, are the so-called 'psychological' or 'functional' troubles. These stem from the physical condition. We all experience this when we are irritable due to hunger, fatigue or illness. In this group are mental depression, lack of ambition, difficulty in concentrating, nervousness,

worry over little inconsequential things, insomnia, hysterical
2102 tendencies, hypersensitiveness, restlessness, poor memory, chronic fatigue, feelings of apprehension and uneasiness and anxiety, and general weakness. Since these are symptoms of a deficient physical condition, they all improve or disappear entirely

when the person uses our product over a period of time. So it happens that I get the greatest satisfaction from seeing these poor people throw off these 'psychological' troubles, and become normal, happy human beings."

"There is a psychiatrist in New York, Dr. Cowles, I believe," said the Educator, "who says it is not enough to treat a person just through psychiatry—getting him to change his thinking—he says you must build up his body at the same time."

"Doctors are realizing that more and more, too," said Mr. Rehnborg. "Who was that doctor who wrote in for some of our product—from Riverside, I think?"

"That was Dr. ——."

"That's right. I wrote back and told him that since the American Medical Association did not approve of our product because it is sold direct to the consumer, he might not want it. So he came in personally and took home a course for his own use. I think he has sinus trouble.

"He is a good doctor, and I'm glad he's interested. He can do a lot of good in the world when he passes our product on to his patients."

"I had an interesting sinus case lately," said a representative. "He had sinus trouble almost all his life, and for the last twelve years he says it has been so bad he could hardly stay at his barber chair and work. He started on NUTRILITE ten weeks ago, and
2103 the other day he told me he had almost forgotten he ever had sinus trouble. He had arthritis too, and that hasn't cleared up yet, but his sinus trouble bothered him most and is all gone."

"I can tell you something about arthritis," said one of the women representatives. "This is my own case. I am 60 years old, and for several years I was unable to go up and down stairs except one step at a time, and in addition, had to pull myself up with the railing, or be helped by someone. I had aches and pains in my elbow, hand and thumb, in addition to my legs. Also, I wore strong bifocals—had for 20 years—the glasses getting stronger and stronger each year.

"I am now just finishing the first six months of my year course, and for the past six weeks I have been going up and down stairs as I did when a young woman. The aches I have had for many years in my left elbow, hand, and thumb are now almost negligible. And last week the optician changed my bifocals to a less strong lens. I don't know what it is to be tired any more, and I have such a wonderful inner feeling of well-being—it's hard to describe except that I feel 'swell'. As I run around now I'm not conscious that I have a body—it just comes along with me."

"Speaking of not being tired," said another representative. "A lady in Los Angeles is employed at Bullock's as a saleslady, and is on her feet all day. She is 50 years old, and before starting the use of our product she was tired out at the end of the day, and in addition had constant colds due to the air conditioning.

"She has now just finished her third NUTRILITE month.
2104 At the end of the day she walks with the spring in her step that she had when she went to work in the morning. She is without colds, and the neighbors in the apartment where she lives constantly remark about her improvement."

"Nobody has said anything about heart trouble yet," remarked a representative, "but here is an interesting case: Mrs. ——, who is Matron of the Eastern Star, was highly nervous and high-strung, and she had a heart condition which caused her much worry, and which interfered with her work and her lodge duties. She has just finished five months on a #15 course, and her whole condition, including the heart, has improved to such an extent that she is calling her friends on the telephone and telling them about our product."

"It is interesting to note," said the Educator, "how the people who use our product become boosters. Just the other day a stranger phoned me from a nearby town, asking me to see him. When I got there I found he was number 8 in a chain of users, one telling another until finally the word got to him. I traced it back to a lecture I gave six months ago."

"Nobody has said anything about losing weight," said a woman representative. "When I told you about my recovery from arthritis, I forgot to say that I was overweight when I started, and I lost ten pounds by the end of three months. But I haven't lost any more because I eat too much pie and cake."

"All a person who is overweight needs to do," said Mr. Rehnborg, "is use our product, and then cut down on his food intake."

"I haven't had much success getting fat people reduced," said the Educator. "They won't cut down on their rich pastries."

2105 "Speaking of eating," put in a woman representative, "my husband, for the first time in twenty-five years, is without indigestion. He is just completing his fourth month with NUTRILITE. He is just fine. He works as a conductor and eats in restaurants. He told the proprietor of the cafe where he eats, that he can now eat his stew without getting indigestion. The proprietor said, 'If you can eat this stew without indigestion, what you are taking really must be good!' Also, he has had no flu this year, and he always has had it several times, every year."

"I wonder how your asthma cases are progressing?" asked another representative. "I started a boy with a bad case of asthma on our product about a month ago, and he is doing very nicely."

"If a child has asthma, hay fever, or eczema he will respond quickly. This must be because he is growing and developing," said Mr. Rehnborg. But most adults with asthma will recover too, if they use our product long enough. Usually, however, they are impatient for quick results, and they won't stay with it long enough."

"How long does it take?" asked a new representative.

"Possibly a year—maybe two years," replied Mr. Rehnborg. "It depends partly on how long the persons has had the asthma, and upon his physical condition."

"You are right about the children," said a representative. "I started a seven year old girl on our product. She had asthma. Now, after three months' use of our product, she has no asthma.

"Eczma yields very nicely in adults, too. One man had had eczema for thirty years. He got rid of it in four months.

2106 "Do all the people who use our product have something definitely wrong with them, like these people you tell about?" asked a new representative. "I mean, do well people use our product to stay well?"

"I'm getting a larger percentage of 'well' people all the time," said the Educator.

"My experience is that all the people you meet, no matter how healthy they may seem, have some secret ailment," said one of the old timers in the organization. "Either their teeth are decaying, they have constipation, they have frequent colds, they are too fat or too thin, they have high or low blood pressure, or indigestion, nervousness, fatigue, brittle nails, aches and pains in various parts of the body, headaches, or they are growing old too fast. Usually we tend to think of these ailments as part of living, and that nothing much can be done about them. But many of these people are interested in feeling better, and in eliminating their physical troubles, and so they are interested in our product. Also, most people know their parents or grandparents died of some particular trouble like cancer, consumption, heart trouble, or apoplexy, which they rather fear, and which they would like to avoid. And they too use our product."

"That reminds me," said a new representative, "I need to know more about our product, and why and how it was developed."

"That's easy," said one of the older representatives, "let's get the Educator to give us his lecture. I understand it is very interesting, as well as instructive. How about it, Mr. Educator?"

"I don't have the lecture cards with me."

"I have a set in my car. If I get them, will you give it?"

"I will if you coax me," smiled the Educator.

* * * * *

2107 The lecture cards were brought, the Educator smiled again at his audience, and spoke as follows:

"Once a man had a little calf. It was a cute little brown calf with a white face. He took the calf out to his pasture, here in California one of those ideal pastures in a beautiful valley, so all year round the calf could find plenty of food, and water from the stream.

The man left the calf there, with some salt, and took a trip around the world. He was gone a year. When he returned to his calf he

found, as we would naturally expect, that it wasn't a calf any more at all—it was a cow. It was a great big cow, with horns and hooves and a long tail.

As the man stood there by the fence and gazed at his cow, he began to wonder where all the material came from that wasn't there when he left. What made the horns, and the hair on the tail, and the hard material of the hooves?

Obviously, it all came from the grass, since that is all the calf had to eat, with a few leaves, possibly, which it may have nibbled from a young tree.

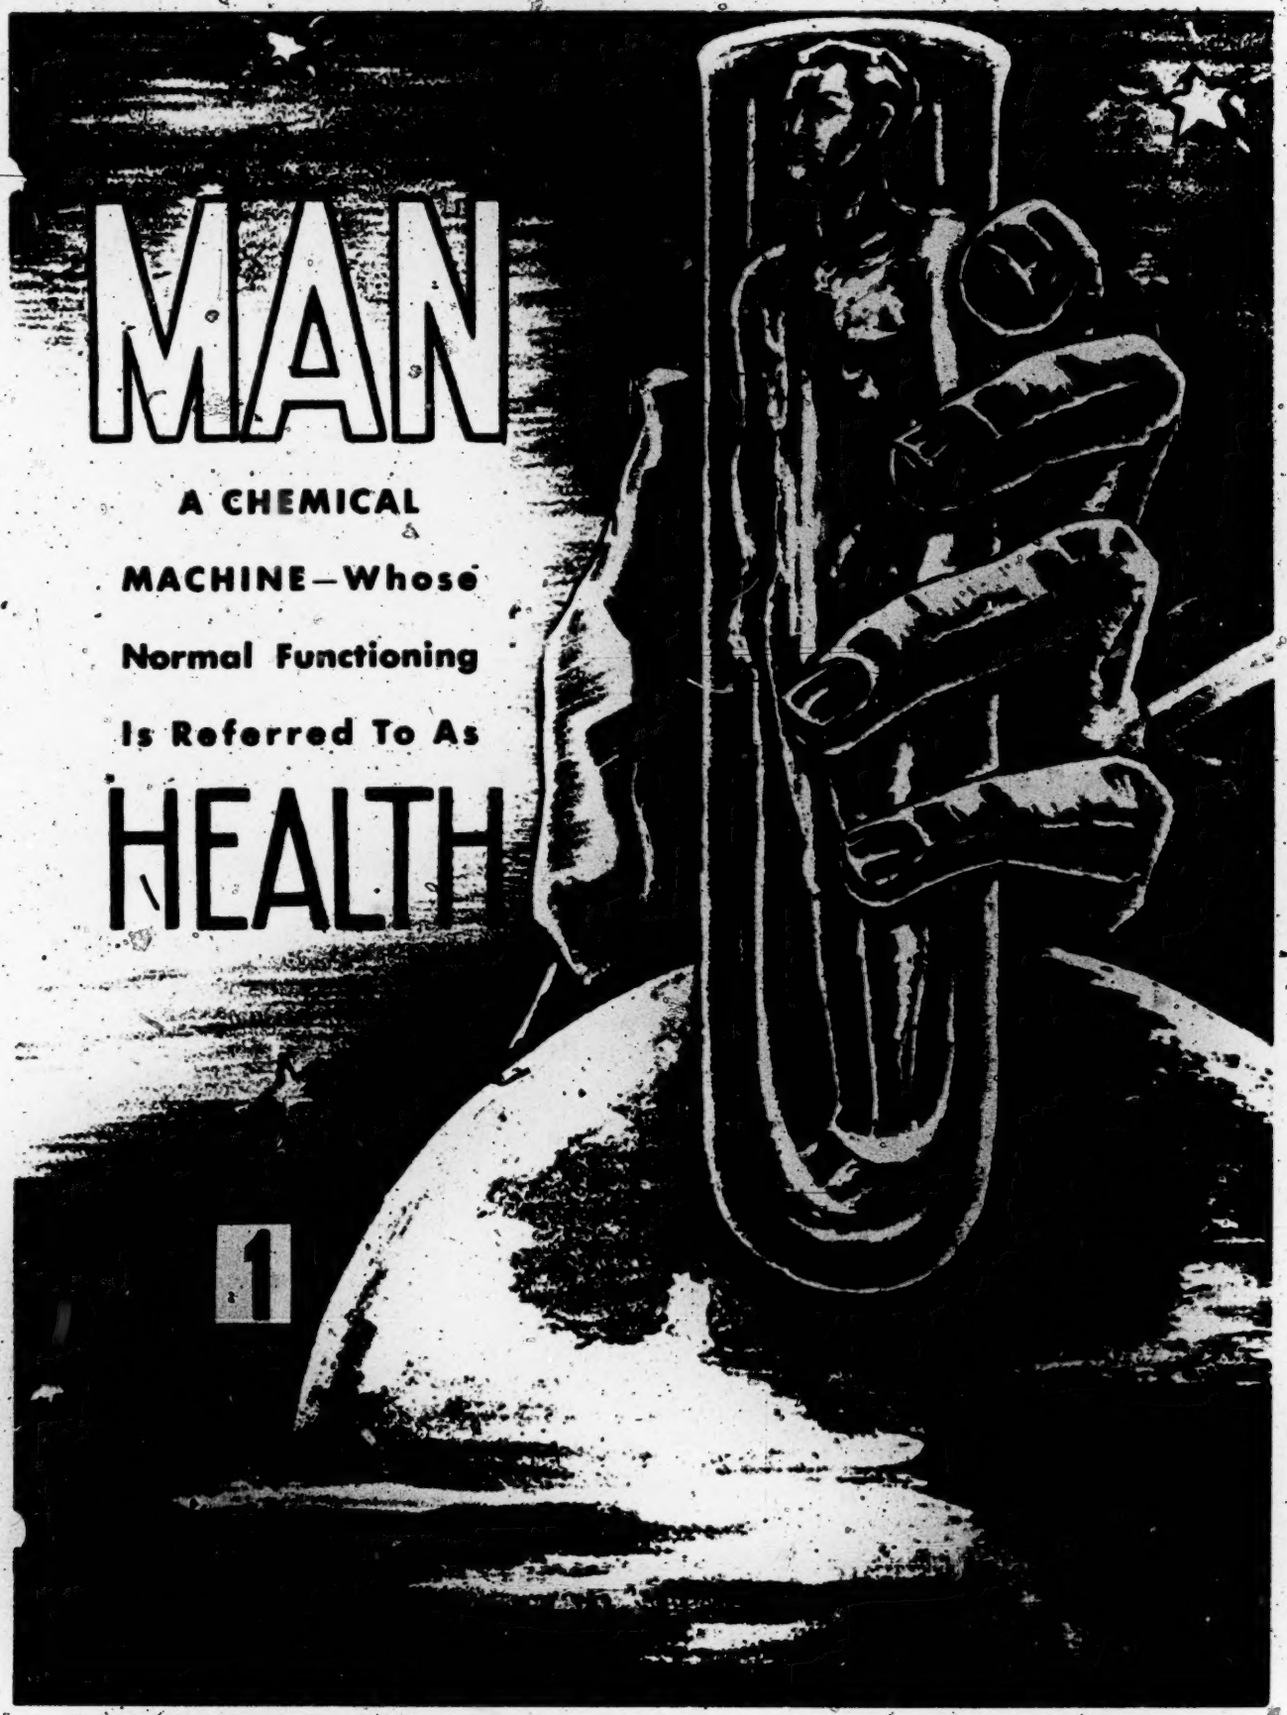
Now, believe it or not, where the material came from, to make the cow, is important to all of us, for we too grow up in the same way. We too start as a very small animal, and we finish as adults with hair, teeth, bones, finger nails, inner organs and muscles not possessed at first. (Of course, some of us *don't* have any hair or teeth when we're grown up, but that's all part of the story too.) As we grow up the hair and teeth grow—they have to be made of something. Where does this material come from?

2108 Again you say, it's in the food we eat. It's in all the stuff we put into our bodies—in the meat, potatoes, milk, bread, candy, coffee, ice cream, pancakes and fruit, vegetables and nuts. Anyway, we hope it is.

It's much like building a house. Suppose you build a brick house, but while it is being built, the bricklayers substitute a lot of wooden boxes, made to look like bricks, for the real bricks. Obviously in an earthquake or big storm, you would lose part of your house. Or a wall might come tumbling down at most any time. So you call some more bricklayers and they put in a lot more of the imitation bricks along with the good bricks. Everything looks all right, and you think you have done a good job in taking care of your house, but actually your house is still weak, ready to fall apart, and it will stay weak until you get every imitation brick replaced with a good brick.

How many imitation bricks do you suppose you have in your body? It's pretty hard to tell, of course, but here are some facts and figures that will give us an idea of the condition of the bodies of us Americans.

Children die every year in this country from malnutrition. Notice it is not in Europe—not in Japan—not in China during a famine—but right here in the U. S. According to the Bureau of Education, 50% or more of our children in schools need medical attention of some kind. Four million of the boys drafted for army service were rejected for physical defects and inability to serve.



According to a recent study made by the Pennsylvania College of Philadelphia, only one in a thousand is not suffering from
2109 deficiency—from malnutrition. This means that no one can safely say: "I am perfectly healthy and my body is sound and well nourished."

Think of our population, and think of the number of cases of cancer, diabetes, heart trouble, high blood pressure, constipation, tuberculosis, arthritis, neuritis, and so on ad infinitum.

This would certainly make it look as though each of us might have a body containing many imitation bricks, so that we look reasonably well, we can get around and do our work, but either we are now experiencing some disease, or we are ready to come down with one.

Man is a chemical machine. You know you can take some cold hydrochloric acid and some cold copper, put the copper in the acid, and soon both the acid and the metal are *hot*. That is a chemical reaction. And in the same way, when you put cold food into your body, and the body converts it into heat to keep you warm—that, too, is a chemical reaction. Thousands and thousands of chemical reactions take place in your body every second of every day, and you don't know anything about what is going on.

(Here follows 1 Photolithograph, side folio 2110.)

MAN
A CHEMICAL
MACHINE—Whose
Normal Functioning
Is Referred To As
HEALTH
1

2111 In Illustration #1 we see a man in a test tube, where his chemical reactions, metabolism, allergies and general aches and pains can be studied.

I have a great respect for doctors. We couldn't get along without them. But there are two words doctors use that often confuse us. One is the word metabolism. "Your metabolism is out of balance," they say, or "Your basal metabolism is way too low." Now this word "metabolism" is awkward. What does it mean? Few people know. But the doctor doesn't use the word to confuse you. It's just his scientific way of expressing it. He refers to the *chemical changes* in living cells by which the energy is provided for the vital processes and activities, and by which new material is assimilated to repair the waste. If your basal metabolism is low, it means that this *chemical process* is not very productive of energy and new material. You can correct your metabolism by living right and *eating correctly*. Just as this metabolism is going on inside your body right now, and you don't know anything about it, so if you give your body the right material, and treat your body reasonably well in other ways, it will automatically correct any fault in the present chemical processes.

Another word the doctor uses is "allergy." He will tell you you are allergic. I heard a doctor say recently that almost everything wrong with us was due to some sort of allergy. He means the body has become so sensitive, that a certain something, otherwise harmless, will cause trouble. I know a little girl who is allergic to feathers. When feathers are near her she breaks out in a sort of rash. Some people are allergic to pollens of weeds, or flowers. Some are allergic so cats. A doctor told me recently of a man allergic to sunlight. Allergies seem so popular, it's a wonder someone
2112 doesn't say he is allergic to his wife, and claim a divorce.

Now it may be perfectly true that your body is sensitive to certain things, and that you really do have an allergy. But this is the big question—why is your body so sensitive? It isn't enough to know your allergies, and then try to avoid them. The real need is to get your body so adjusted that you won't be so sensitive—so your won't have the allergies. And here is what the doctors will be saying 25 years from now. "There is something wrong with your body chemistry if you have an allergy, and the allergy can be eliminated by your own body, automatically, if you will just give your body all the building material it needs." By this I mean, just give your body everything it needs to restore its chemical balance. Your body is a chemical machine, and always the chemical balance must be maintained. When your body gets out of chemical balance, you are ill. When you get into chemical balance and stay there, you are well. That's health in a nut shell, and that's what we find when we put man in a test tube and study him.

Now—what gets our body out of chemical balance? In other words, what makes us sick, and what gets us well? Here is the story.

(Here follows 1 Photolithograph, side folio 2113.)

THE FORMULA OF TOMORROW

— for the World of today

2

HEALTH

Includes the six
Basic fundamentals
For sound Health:

- SUNSHINE
- FRESH AIR
- PURE WATER
- PROPER EXERCISE
- SUFFICIENT SLEEP
- PROTECTIVE FOODS

Remember this... THE AMERICAN DIET IS DEFICIENT IN PROTECTIVE FOOD FACTORS

2114 In illustration #2 we find noted the six fundamentals of health (namely: sunshine, fresh air, pure water, proper exercise, sufficient sleep, and protective foods. Remember this—even our celebrated American diet is deficient in proper protective food factors. Pure water and fresh air and sunshine we don't worry about. Especially in Southern California. We have an abundance of all of them. If we lived in Calcutta, India, this water question would be something to worry about. But we take those things for granted here in Southern California. The need for proper exercise and sufficient sleep is known to every intelligent person.

Now consider the protective food factors—those little things that you and I eat, that enable us to convert our ordinary foods into energy, new skin, blood and cells, and which make it possible for the body chemistry to operate correctly. These elements in our food are called, in the text books of the biochemists, *nutrilites*. That's a technical word you won't find in your dictionary, but it means all the little food factors—not the fats, minerals, carbohydrates and proteins we hear so much about, but all the factors such as the vitamins, chlorophyll, bios, inositol, and many others.

This is an interesting thing to me. We all used to think that all we had to worry about was the bulk we could see on our plates—the fats, minerals, carbohydrates, and proteins of which we are built. Now we are learning about the vitamins and other nutrilites, and the history of their discovery is interesting.

There was a Swiss biochemist, whose name was Lunin, who was intrigued by the consideration that there would come a time when the growing population of the world would be so great that the
2115 ground available for growing foods would be insufficient to support them, and he conceived the idea that it might be possible to feed human beings, as it was possible to feed animals, on substances which were not commonly recognized as a food. To determine that this was a sound theory, he fed experimental animals on synthetic diets made up of the substances that science then thought were contained in foods. These experimental animals were fed pure carbohydrates in the form of corn starch, pure refined fats, and protein secured from milk and leached with ether until nothing but protein was left. To this mixture he added all the minerals that analysis showed were in the body, and then fed this diet to animals. In theory they should have been able to maintain life, but they all very promptly died, and successive experiments of similar character all failed, *unless small quantities of natural green materials or milk were added to the diets.* Lunin concluded that there were substances not yet discovered in foods which were essential to life.

By some strange indifference that problem was not investigated further for another twenty-five or thirty years. At that time there was a Dutch physician in charge of a prison hospital in Java. The patients in his hospital were mostly suffering from an oriental dis-

ease called beriberi, which is a Malay slang word for "no can do", because the men who have it are incapacitated. They suffer much pain and finally die.

The Dutch physician, Doctor Eikjman, noticed also that the pigeons that flew around the prison yard seemed to have a similar disease. Their heads were drawn back and their wings and legs were partially paralyzed and they died. He also noticed that what they ate was chiefly the white grains of rice that fell from the chow bowls of the prisoners as they ate their meals. Because it was polished rice, as an experiment he fed the birds *unpolished*
2116 rice—and they recovered. He then fed unpolished rice to the men, and they also recovered. But, Eikjman, being a physician and dealing with a totally new effect, concluded that there was a toxic substance in the white grain of rice for which the antitoxin was in the rice hulls.

About the same time a Japanese physician was trying to stamp out the same disease in the Japanese Navy. He knew that the staple diet of the Navy men was white rice, and he concluded that the reason a diet chiefly of white rice causes beriberi was because it did not contain sufficient protein. So, picking a training ship, he arranged that the diet of the cadets on the training ship throughout the cruise should include beans, rather than rice, as a staple food. On the trip there was no beriberi whatever. He concluded that the reason for the beriberi was the lack of protein.

An American, by the name of Williams, who was then in the Philippines, following these conclusions, advanced the completely new idea that the reason for the sickness was not something the sufferer had eaten, but was because there were factors, normally present in natural foods, the lack of which caused the disease. In other words, the sickness resulted from something not eaten. All that is known of these factors, which we now call vitamins, or nutrilites, has been discovered in the past forty years.

Very early in this investigation it was discovered that one of the principles involved was contained in butter fat and dissolved in fats generally. It was called "fat soluble principle A". Another principle, the lack of which was responsible for beriberi, was found to be water soluble and was called "water soluble principle B".
2117 Sometime around 1912 a scientist named Funk believed from his investigations that he had proved that the substances in question were amines; so, he proposed the name vitamines, or *amines* vital to (vita) life—vita-amines. Later it was discovered that they were not amines and the final "e" was dropped and they were called vitamins. Fat soluble principle A became Vitamin A. Water soluble principle B became Vitamin B. Presently—about 1919—we knew of Vitamin C and Vitamin D. Then it was discovered that Vitamin B was not simple, but composed of at least two factors, and when this separation had been established, it was

discovered that the second of these factors was extremely complex. It is now known to comprise not less than fourteen distinct values, and for convenience it is called the "B-Complex."

From 1920 until 1930 the knowledge of the vitamin (or nutrilite) factors grew until there were about ten known. In the next ten years perhaps thirty more were discovered or postulated, and most of the first ten were made synthetically. Now, no one knows how many there are. There may even be twice as many as are known, or assumed to exist, but they have one character in common—they all originate in the green leaves of plants. And the nutrilites, you remember, are ALL the little vital food factors, including the familiar vitamins. So if you want to be really stylish and up-to-date, you should talk about the nutrilites, and not just the vitamins, for the nutrilites are ALL the protective food factors, including the vitamins.

Now, be sure to remember this: the American diet is deficient in these protective food factors. Why is this true? We are sick and ailing because of what we *don't* eat. Why *don't* we get all the nutrilites we need?

(Here folows 1 Photolithograph, side folio 2118.)

Enemies of HEALTH

- DEPLETED SOIL
- IMPROPER COOKING
- PROCESSING; STORAGE & SHIPPING DELAYS

Resulting in: *devitalized, demineralized and denatured foods!*

★ Henry A. Wallace says:

"50% of the people in the United States do not get enough in the way of protective foods (containing vitamins and minerals) to enable them to enjoy full vigor and health."

3

★ Lela E. Booher, Chief of Foods & Nutrition Div., U. S. Bureau of Home Economics informs us:

"The chief fault of many American diets is that they provide too little of the essential minerals and vitamins.

★ English Academy of Medicine, LANCET, states:

"99% of common illnesses are due to or are superimposed on vitamin deficiencies."

OUR ARMED FORCES KNOW • They supplement the diets of our fighting men with vitamin concentrates.

2119 In Illustration #3 we find the answer—depleted soil, improper cooking, processing, storage and shipping delays cause devitalized, demineralized and denatured food.

"Well," you say, "What's that got to do with it?" Here's the answer. Consider storage and shipping—consider an orange. An orange stored thirty days loses some of its vitamin value. Cold storage preserves food, but not one hundred percent. Therefore, your friend and my friend in Chicago or New York get oranges with a lowered value. They are figuring now that after the war we will not ship fresh fruits and vegetables in storage cars. Instead, we will put them on a plane tonight and twelve hours later they will be in Chicago.

As a matter of fact, possibly you saw that clipping in the Daily News for about the 6th of July, 1945. An American Airlines C-39 giant four-motored airfighter carried fruit and vegetables from Salinas, the "Salad Bowl", to Cleveland. The plane loaded the produce, picked early Wednesday morning, left at 9 a.m., and the fruits and vegetables were being carried home from the Cleveland markets the next morning. Think of that! Contrast that twelve hours with twelve times that and you will know what it means to have fresh fruit in Cleveland. Take your Oregon and Washington apples. We get them along in February and they are not as good as apples picked in October. We know that. Well—so much for the shipping.

Now consider the matter of processing. The beriberi which afflicts the Orientals, who eat a lot of polished rice, is the result of processing. In this country we eat polished rice, and also white flour. Do you know why they give us white flour and why it is so hard to get whole wheat flour, and good whole wheat bread? Be-

2120 cause millers discovered that white flour would store well without getting rancid, and that weevils would not get into the processed flour. Either the weevils had more sense, or they didn't find enough nourishment in the white flour. Anyway, that's the reason for white flour. And just as the weevils can't live on it, we can't either. The weevils have to supplement their white flour diet, and so do we, for it's what we *don't* eat that makes us sick.

Sugar is another item which is highly processed. The negroes of the tropics who chew the sugar cane get sugar *and* minerals *and* vitamins, but we who eat the refined sugar from the cane, do not. And further, the white sugar actually draws on the body's stores of certain nutrilites necessary for the chemical processes the sugar goes through in the body as it is used for energy, so that white sugar not only doesn't give us the nutrilites we need, but it takes from us some that we already have. A double loss.

Now let's talk about cooking for a minute. Far be it from me to tell a lady how to cook, but there are certain things that happen in cooking that make it necessary to consider it. In other words, our

food is prepared for taste and appeal, not scientifically for health. We cook so that our foods will be pleasant to eat, not because they are better for us.

Now, what's lost in cooking? Here's a fair example. Last fall when there are plenty of peaches to can, this article appeared in the local paper: "Peaches are good sources of vitamins. When canned they retain one-third of their original value." We don't worry about the half-dollar we save. It is the one we lose we worry about. I read that article this way: "Peaches are a good source of vitamins. When canned they lose approximately two-thirds of their original value." When you stop to think, we *are* losing two-thirds of the real value to us of that peach. That's something worth thinking about. That's one reason why this body of yours (and
2121 mine) doesn't feel and act as well as it should. That makes sense, doesn't it?

The same thing is true in the cooking of many of the vegetables. Unfortunately for most of you women, men like meat, potatoes and gravy. We are not good vegetable eaters. We ought to be. But even if we were, would we get the nourishment we need? In the preparation of cabbage, as an illustration, you put a nice green head of cabbage in the pot and it comes out something between tan and brown. The chlorophyll is gone as well as the vitamins and minerals which are quite soluble in the cooking water. Even if the cabbage was as good as it should be to start with, which is not always true under modern cultivation and storage transportation, it certainly is not as good as it should be when it is finally cooked and served. The drain pipe gets most of the good foods and you and I get what is left.

The greatest enemy of all is depleted soil. We have known that for a hundred years, but we have done very little about it. 'Way back in the days of Thomas Jefferson it was recognized that the soil in Virginia was being depleted, because the quality of the tobacco crop was falling off. So Thomas Jefferson bought most of the rest of the United States for some ten million dollars. He had to have more rich, fertile soil to grow good tobacco. Now, today, the government, both state and national, is selling the farmer on the idea of remineralizing the soil. For what? So the farmer can grow heavier crops, bigger hogs, finer cattle and sheep. The farmer will do it so he can make more money, not so that he can serve you better food. He does it so he can make more money out of it. As time goes on we shall see more and more remineralization of the soil, but now it is being rapidly demineralized. You have often passed
2122 some field, I'm sure, where vegetables are grown. You see them take off one crop after another, with just enough remineralization and fertilization to grow a good looking crop. The farmer doesn't care anything about the mineral content of his plants

—just their appearance and taste, for you buy according to looks and taste. So the food grown in that soil can't have as much food value as it should. It is impossible to take out, over and over, putting very little back, and have good food.

On the other hand, here is an example of what happens when the soil is properly mineralized with respect to only one of the essential elements. In Deaf Smith County, Texas, a dentist moved in to start his practice. But business was poor, and when he investigated, he found that practically nobody had any decayed teeth. The residents of Smith County didn't need a dentist because fluorine, in addition to other elements, was present in the vegetables and in the drinking water leached through that soil in quantities great enough to produce perfect teeth. So right now they are starting to import water from Smith County into other states, in ten thousand gallon lots. But, unfortunately, there isn't enough water in Smith County to go around. Although it is a fine example of the protective value of minerals, it doesn't solve our own health problems.

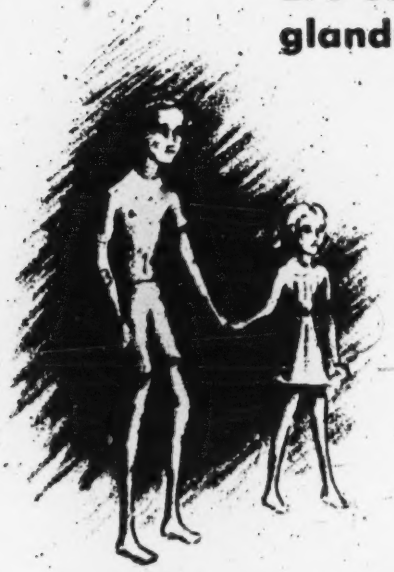
22 MILLION Children



NEED CORRECTIVE TREATMENT — U.S. CHILDCLINIC

10 MILLION
have bad teeth

4

6 MILLION
are suffering from a glandular disturbance

4 MILLION
are improperly nourished in other ways

1 MILLION
have tuberculosis

1 MILLION
have spinal curvatures

90% OF THE CONDITIONS ABOVE

Originate in Deficiency of Protective Food Factors

WHAT'S WRONG?

2124 As you read in Illustration #4, twenty-two million children in the United States need corrective treatment, ten millions of them have bad teeth, six millions are suffering from glandular disturbances, four millions are improperly nourished in other ways, one million have tuberculosis and one million have spinal curvature —and even the curvatures may originate in deficiencies in protective food values—the nutrilites. And we can all see that it is the type of food we raise or buy that causes this condition.

Twenty-five years ago in the first World War, we rejected twenty to twenty-five percent of the men and women eligible for service. Today, twenty-five years later, in the second World War, we rejected forty percent, or almost twice as many. Over half of these people have deficiency ailments.

Here is an extract from a clipping in the New York Times, printed June 29, 1945. "The record of 33 per cent rejections for women (applying for admission in the WACS) indicates an even more serious health situation for women than the 40 per cent rejection rate does for men," said Dorothy La Salle, in charge of the girls. "It is to be remembered that these women were all volunteers, and at least thought of themselves as being well enough to join the W.A.C.", she said. "I am sure that if we could have a complete cross-section of the women between the ages of 20 and 50, a much higher rejection rate would be found."

That's interesting, isn't it? It means that you can think you are in good health and *still* be experiencing some 'little' health difficulty which is important, but neglected.

2124a You can think you don't need nutrilites—the protective health factors—and yet be wrong.

Coming back now to the men and women applying for admission into the Army or Navy, remember your 4-F was already 4-F when he was eight years old—not suddenly when he was eighteen or twenty-eight. It is true, whether you want to believe it or not. Of the six hundred six thousand 4-F's of California, forty per cent or more can be rehabilitated and built into real men. One of the principals of a High School here had a son. He was weak and petted and pampered. He was allergic. He looked like a healthy vigorous man, but he couldn't eat this and he couldn't eat that. Uncle Sam got him into this man's Army and started feeding him good solid food, with vitamins added. Regular habits, plenty of rest and exercise, the right food, and vitamins, and now he eats everything. He isn't allergic to anything. And they wondered what was the matter with that boy. Overindulgence. One educator said to me recently, "The American public is overfed and undernourished —more so than any other people in the world." And I think, "How can we expect to be healthy folks when our food is so poor?" You can't get prosperity out of poor food either.

(Here follows 1 Photolithograph, side folio 2125.)

ON TOP — BUT NOT ON TOP ?

Low vitality—over-fatigue—insomnia—poor appetite—gastro-intestinal distress—recurrent vague aches and pains—weak eyes—defective teeth—all of these may be caused by the lack of the "Little Things" in the diet.

5

Is there a Solution? THERE IS!

WHAT IS THE SOLUTION?

2126 You ask, "Is there some help? I don't need it for myself—I'm on top, but my neighbor, or the rest of my family—they need it." You say you are on top, but are you? Like the girls turned down by the W.A.C., you have low vitality, insomnia, recurrent aches and pains, weakness, and the prospect of operations, defective teeth and colds. All these may be caused by the lack of nutrilites—those little things not in your food—like the little man that wasn't there.

Here is a recent report on colds, for instance, dated Chicago, July 4, 1945, and printed in the L. A. Examiner. Dr. Joseph H. Kier published a report covering a two-year study. He says the common cold affects more women than men and costs $2,000,000,000 a year. Smoking apparently has little effect on colds, but posture is an important factor (I presume because poor posture cramps us and we take in less oxygen). Most colds occur in December and fewest in July (we don't need a two year study to tell us that). There are more colds per 1,000 of population in Chicago than in the East. Colds occur more in the 28-29 age group and less often above 50, but the percentage of time-losing colds increases with age. (As you grow older you can't take it.)

This articles tells us about colds, but not what we really want to know—what causes them? Do you know what causes our low vitality, insomnia, aches and pains, weakness, physical condition requiring an operation, and defective teeth, not to mention many other troubles you can think of, and which you are now very likely experiencing?

Here is something I think is interesting. There are four types of sickness or physical ills known to man: First—accidents. Second—those resulting from bacterial invasion (diphtheria, scarlet
2127 fever, smallpox, malaria, typhoid, cholera, and so on). Third—poisons. Fourth—malnutrition, or lack of proper material in the body. Imitation bricks instead of the real thing, and the diseases of malnutrition by many times outnumber the others.

So according to science, if we rule out accident, poison and bacterial invasion, *your* sickness and *my* sickness is due to malnutrition—due to what are commonly referred to as deficiencies.

In other words, if you are nervous, if you always feel tired, if you catch cold easily, if you have high blood pressure or low blood pressure, if you have rheumatism, or neuritis, or if you have indigestion, gas or constipation, you have symptoms of what science calls MALNUTRITION.

Why are we having so many of these common health problems nowadays, whereas a hundred, or two hundred years ago people didn't have them so generally?

Great-grandpa used to take the grains to the mill and bring back the *whole* flour for bread and cereals. Today the grain is shipped to

the mill where all of the bran and germ is taken from it, then a chemical is used to bleach it. Most bakers use other chemicals to make it rise when making bread and cakes. Result,—you and I do not get what our great-grandparents used to get in the old days. Is that correct?

Then remember, great-grandma's vegetables were most likely grown in virgin or at least good soil, while today much of civilization's soil has been used so often and so intensively that it has become demineralized. The effect of soil on vegetables grown from the same seed in various parts of the country is very obvious in the difference in color and flavor, as well as size and texture.

2128 What does all this mean? It means that in order to compensate for the losses caused by refining and processing, storage, canning and cooking, and also due to the lack of minerals in the soil, we have to eat two and three times as much food as would otherwise be necessary.

This results in overloading our stomachs, overworking our livers and kidneys, and eventually a break-down of one or more of these vital functioning organs.

Besides, we are spending more than we should for food, because we have to eat so much,—and even then our bodies are not properly nourished.

Is there a solution to this problem? Is there anything available that will take care of our health problems, aside from medicine and drugs?

The answer is YES. Definitely. There is actually a product in existence right now, which holds the answer to our food problem. It makes it possible to get the materials into the body that the body needs to rebuild itself, and to keep itself strong and well.

This product really solves the problem of intake and *assimilation* of sufficient quantities of vitamins, minerals and other elements needed to put, *and keep,* our bodies in *chemical balance.*

To understand something of the extensive research that went into the discovery and development of this important aid to health and happiness, it is necessary to go back some years, and mentally travel thousands of miles.

(Here follows 1 Photolithograph, side folio 2129.)

1142A

THE STORY
of the PLANT BASE in NUTRILITE

植物的生命就是人類的生命

Nearly — Thirty Years Ago, Carl Rehnborg, selling, canned milk in China, found himself blocked by ancient traditions —milk was not generally used by the Chinese even for babies. As a demonstration he began nursery feeding of the babies of the poor with his canned milk, to which was added glucose, minerals, and a formula water made of native rice and barley. Improvement was slower than hoped for, apparently something was still lacking in the babies' diet. Vitamin knowledge was then very incomplete, but through his early training in chemistry and related studies, Rehnborg had developed a theory that many, if not all, of the food factors essential to health originated in green plants. Fertilizing a plot of ground with necessary minerals, for vigorous growth, he planted it to alfalfa. As soon as the first green leaves appeared he ground them up and added the paste to the babies' formula. At once an almost miraculous change took place:

6 *not* ONE *of the babies failed to* IMPROVE!

2130 Thirty years ago, a young man by the name of Carl Rehnborg, of Swedish descent, graduated from an eastern university. He had majored in biochemistry. In time he became associated with one of the largest manufacturers of American canned milk. He was selected by this company as their representative to the country of China—to introduce this product to the mothers of Chinese babies. He soon learned that this was a very difficult assignment, about the same as trying to sell refrigerators to Eskimos.

He tried to convince these mothers that his company's famous product would make their babies fat and well, but everywhere he turned he came up against the stone wall of Chinese indifference. The Chinese had never used dairy products—babies had always been nursed.

Finally, although he was not a medical man, he decided to establish a demonstration clinic. He went into the slums of the great city, where poverty, ignorance, filth and disease had created an appalling death rate among the new-born, and opened a tiny nursery. Here desperate mothers, frantic to the point where they were willing to grasp at any promise of hope for their starving, ailing infants, willingly placed them in his care.

Mr. Rehnborg's belief in his company's product was genuine. Yet weeks of feeding one of the most highly advertised and recommended American canned milk products to these sick Chinese babies brought disappointing results. The milk was being carefuly formulated, but apparently milk was not the whole answer.

Having specialized in the chemistry of foods, and having taken a part in some of the early vitamin research experiments, he was convinced that the vitamins, the various minerals, and certain
2131 other essential diet factors, as yet unidentified, were present in many raw foods. But apparently they were absent or deficient in most cooked foods. It was not even certain that cow's milk contained the *best* concentrations of *all* of them,—at least for human infants.

He believed these essential food factors were most highly concentrated in green plants, from which the milk-givers and all other animals finally secured them. The therapeutic food value of green growing plants had been further indicated to many observers by the fact that even the meat-eaters among the animals, including man's own dogs and cats, almost invariably exhibited a tendency to eat grass as a conditioner, especially when ill.

So, with continued feeble health or early death facing his infant patients in almost any event, Mr. Rehnborg went out and gathered quantities of green grass, alfalfa, and other fresh green plants,—scrubbed them thoroughly to rid them of all foreign matter, then carefully dried and ground them to a powder. Mixed into a thin gruel, he fed this powder to the babies, along with their milk.

Almost at once some of his little charges began to show improvement. Some of the babies in the clinic, by now expanded to several times its original size, began to take on weight at a more normal rate, became less listless, commenced to throw off visible symptoms of the various illnesses with which they had been afflicted.

But not all of them. Some still failed to show the hoped-for reaction.

But the man who held their future life and health in his hands was convinced that now he was on the right track. He suspected
2132 that the chemically worn-out soil of China was deficient, so that plants grown in it could not supply the consumer with all the required minerals, and probably did not even contain the normal quantities of vitamins and other essential organic substances they should produce. He subjected samples of the soil to chemical analysis. When this theory was verified by the test-tube method, he leased ground of his own, plowed the minerals, which were lacking, into the soil. Thus he grew his own green plants, containing a full complement of essential food factors as he recognized them.

And when his plants were harvested, processed, and added to the diet of the babies in his clinic, not one failed to respond as expected.

The visible results from having fed these Chinese babies on a diet rich in all the vitamins and minerals then recognized as essential, (plus other food factors which he assumed were equally essential to health because they were normal components of normal plants, although their essential character was not then proved), convinced him that he had developed a practical formula for perfect chemical balance for the body, which would restore normal organic function, build resistance to infection, and strengthen the body so that it could throw off symptoms of disease and maintain complete health.

Therefore, he still further perfected this food supplement by extraction processes, discarding the non-essential cellulose and other parts of the plants, so that much value could be concentrated in small volume; and then tried the supplement formula on adults.

It is well-known that life in the Orient has always had a deteriorating effect on members of the white race. The big companies which sent men to China to represent them never kept these representatives on the job for more than about three years at a time. They were
2133 then given six months' furloughs to return to their own countries. The reason for this was that by the end of two or three years most Americans and other "foreigners" had reached a run-down condition which only a long vacation in their native climate could mend. Climate was supposed to be the essential difficulty in China. Having discovered the vitamin and mineral deficiency in Chinese-grown food, our chemist reasoned that this

deficiency, rather than climate, probably was the cause of much of the ill health among Americans in the Orient.

True enough, Americans fed on his specially prepared supplement were able to withstand the deteriorating effects of life in China. These men returned to the United States as well as when they left.

Now, then, what has this story of a diet for Chinese babies and Americans in China have to do with you? It's simple enough, for although the standard American diet is one of the best in the world and admittedly far more healthful than can be obtained in the Orient, food chemists, dietitians, and even the medical profession have long realized that our present-day processed, preserved, and cooked foods do not constitute a natural or a complete diet for the human race.

Chemical and biological science have established the fact of the chemical nature of the life process and that living things of all kinds must be in chemical balance to be normal. It is known that many of the ills and diseases of human beings are unnecessary—that they are the result of chemical starvation of our bodies for substances vitally necessary to life.

This is not a fad but the opening of a door to a new way of life and living for all mankind. It has to do with the accessory food factors so small in bulk that although they have always existed
2134 in foods they have escaped attention and were unknown until the science of chemistry and endless patient research disclosed their existence and their nature—they are Vitamins and the other Nutrilites.

Is is a fact that the body, when given the normal American diet, just runs down. Look at the people around you. Many of the children already show a marked deterioration, and you see it in almost everyone over forty.

But those men and women who ate Mr. Rehnborg's leaf concentrate didn't have to be rehabilitated.

(Here follows 1 Photolithograph, side folio 2135)

all of the factors
REQUIRED *in* HUMAN NUTRITION

come from

PLANT MATERIAL

1

therefore:

MAN

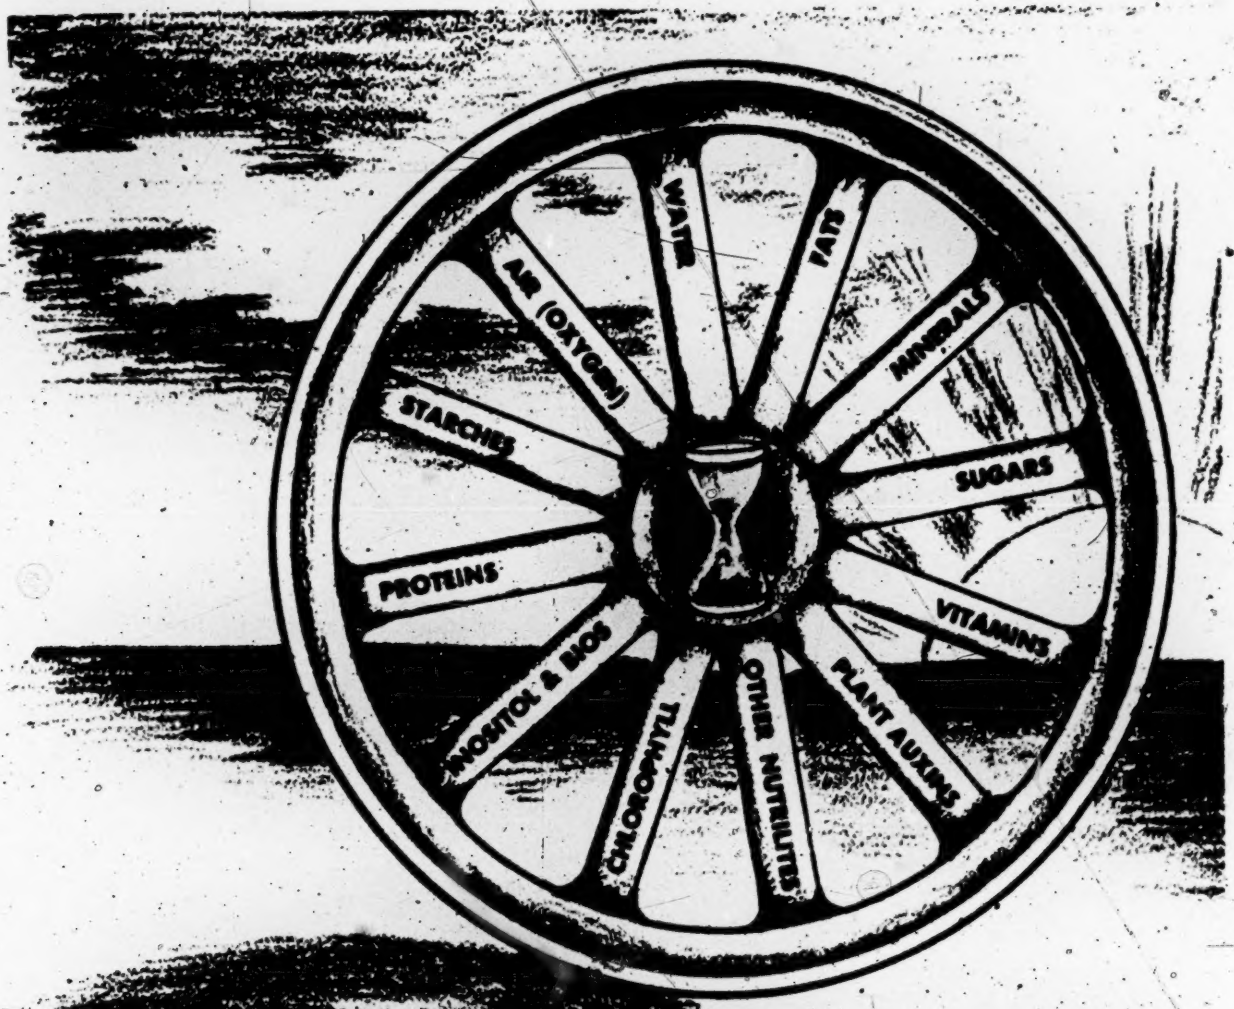
is dependent upon the

PLANT KINGDOM

for HEALTH

2136 When Mr. Rehnborg returned to the United States about 15 years ago, he started down in Balboa, California, to develop a food substance to help people—a food supplement to cause the body to live normally. Soon people started to make a track down there and finally a group of people in Long Beach found out about him and built him a laboratory and the next fact was the development of a complete food supplement to supply the elements lacking in the food we eat.

And where would you think he would get these vital additions for our diet—these nutrilities? Exactly, from plants. So his plant base, or plant concentrate, the important part of his food supplement, comes from the plants richest in nutrilites—such as parsley, water cress and alfalfa. This doesn't mean that we are going to sit down and eat a meal of raw plants, however. But you can't get away from the fact that the life of the plants makes the life of man, and that the nutrilites in our plant concentrate are what give it its magic qualities. That is why our product is called NUTRILITE.



Our product enables your body to throw off disease and to remain well. The human body is composed of some eighty trillion cells, or approximately two thousand times as many cells as there are humans on the face of the earth, and everything we require as nutrition is required by each of these cells. The only way they can perform their functions adequately and completely is for them to be supplied fully with all the substances that they require for the chemical reactions that we call the life process. Under conditions of civilization many of these factors are simply not in the food we can buy. The result is that, without a food supplement to make up the deficiencies, the delicately balanced machinery of the human body does not perform normally and this lack of normal performance we call 'ill health' or 'sickness'."

2137 There is a record all through history of such ill health among humans. We know that ill health can result from accident or from invasion by bacteria, but we also know that there are a great number of illnesses which do not have any apparent cause outside of the body. These illnesses, which comprise by far the greater part of all those from which human beings suffer, are now considered to be deficiency diseases. That is, they are not entities in themselves; they are merely the evidence of the lack of supply, which is the cause of failure of perfect function. The fact is, then, that human beings under conditions of civilization suffer because of deficiencies in their diet.

This being true, there are just two ways to meet the problem. One is to induce whole populations to change their diets in such a manner that what is eaten will supply all the factors required. This is practically impossible, because people hate to change their food habits. The other way is to use supplements to our usual diet. This is both feasible and practical.

(Here follows 1 Photolithograph, side folio 2138.)

1148A

WHEEL OF LIFE

8

Like any wheel designed to bear a burden, is only as strong as the spokes of which it is formed. Should any of its supporting substances be missing or fail, the wheel is weakened and, as time goes on, it may break down unless these vital elements are restored.

2139 The wheel of life is only as strong as the weakest spoke of which it is composed. Therefore, it must have all the proteins, sugars and starches, nutrilites, and minerals which make the spokes strong. Just deny the body any of them and what happens? You've got a flat wheel, haven't you? Deny yourself air and water and you know what will happen. The body can go for three minutes without air and ten days without water. The body will do its best to live on any food you give it. This has been demonstrated by the people in the concentration camps. They lived on potato peelings and polished rice. They didn't live well, they lost weight, they lost their teeth, and many of them lost their minds, and a lot of them have flat wheels they can never overcome. Your body, too, develops a flat wheel when your diet does not contain the elements needed. What food does for us is shown here:

THE HUMAN BODY *adjusts itself* *to its* FOOD SUPPLY

9

COMPARE the Sikh—huge, powerful fighting man—and the Madrasi—weak, puny, ailing. Blood brothers of the same ancient race, *nutrition* has made them what they are in the 20th Century. Living cramped in areas where the soil has been devitalized through centuries of cultivation, the Madrasi weighs under 100 pounds and his statistical (average) life span is less than 20 years. But the Sikh, living in the hills, cultivating only virgin soil, grows well over six feet and is proud of his 250 pounds of bone and brawn.

2141 Here are two fellows who are blood brothers. The comparison is self-explanatory. And right here at home we find that the Japanese raised in the United States are seven per cent larger, in general, than Japanese raised in Japan.

The best illustration I know in plant life in this section is your hydrangea. Normally a hydrangea has an orchid-pink bloom. Here you will see one an orchid-pink and another a pale blue. Why? All in diet. There are some blue herons in Florida. The herons in the zoo in New York are white. For a long time they thought there was a lot of difference, until they captured some of the Florida herons and took them to New York to the zoo. In a year's time there was no difference—just another white heron. They ate something in Florida that they didn't get in New York and we don't know what it was.

In raising silver foxes in this country you don't have to have cold weather; we know how to regulate the amount of white hair. If you are buying a silver fox and see white hairs standing up by themselves, lay it aside. In real silver fox, the white is in the middle of the hair, but the ends are black. Take them up and blow on the fur and you will see it. Now that white was developed by the diet of that fox. The amount of vitamins or minerals makes the difference. I can give you another illustration of what diet does. Diet brings on old age, various and sundry aches and pains. Diet brings about arthritis and low blood pressure, malnutrition, eczema—all those things are caused by malnutrition, by the foods you eat that do not have the food values you need. Any food supplement that's right, from which you are going to get help, must contain not only all the nutrilites, including the vitamins, but it must also contain minerals often lacking in our diet—copper, phosphorus, cal-
2142 cium, manganese, iodine, sulphur, and so on. You must have these coming in every day in small quantities. Take iodine, for instance. All you have in your body would only make a pile about the size of a grain of wheat, but if you don't have enough, you have a goiter and a lot of other bad things.

The vitamins, too, have a very definite purpose in the body chemistry. Vitamin D, for example, makes it possible for the body to assimilate calcium and other minerals. Having the calcium in your body isn't enough. The vitamin D must be there to enable the body to use it.

They think there are about three specifics in this vitamin therapy, but they are not specific like quinine for malaria. They say there is Vitamin B for beriberi. Yes, but not alone. There is Vitamin C for scurvy. Yes, but not alone. There is Vitamin D for rickets. Yes, but not alone. Quite often you find somebody taking Vitamin D in fifty thousand units dosage. The body won't absorb that much, so far as we know. The only sure way to results in taking vitamins

is to have all of them, and then take something more than enough and let the body decide how much we want.

We know the finger nails are made up of silicon and phosphorus and calciuin. We can analyze a finger nail and tell you what is in it, but do you know anybody who can make one? No. In about three months you would get a new one. Where does it come from? You don't need to feed a finger nail. It comes from the foods we eat.

And so it is in many other parts of your body. As I said in the beginning, we can analyze a plot of ground and tell you what the deficiency is, but nobody is smart enough to analyze your body. We just haven't arrived at that point. We do know that certain aches and pains assert themselves and they are signals for us to do something about it. If we don't do it, they get worse. That's
2143 sure.

Now we come to our most important message. It is important to you if you are ill, of course. But just as important is our message to you if you consider yourself well—and if you want to stay well. Since our product enables you to *get* well by supplying your body with what it needs for health and proper development, it will obviously enable you to *stay* well. You don't have to be sick to need the proper diet supplement. You need it to stay well—and to have more pep and energy, to think more clearly, to enjoy your work, to feel better, to look better, to stay young and vigorous, to get rid of the various "slight" illnesses you have, to avoid other "minor" illnesses and all the serious troubles, and to add extra years to your life.

By this time you are likely wondering how much all this extra health and pep and youthful vigor is going to cost. You know, it's a funny thing, but we Americans tend to translate everything into terms of money. And I guess it's all right, too. Money is important. But what is money compared with health? I think almost anyone would rather be poor but always well and healthy and feeling good, instead of rich and racked with pain.

What is money compared with length of life? Wilkie was a fine man, and although possibly not rich, he was well off, and he might eventually have been President. Instead, he died long before he should have died—at the early age of 52. I wonder what Wilkie would have paid to add 20 years to his life?

What is money compared with youth and beauty? Faust sold his *soul* for youth, in the immortal opera. I wonder what Faust would have paid in money, for youthful pep and energy and a more youthful appearance?

2144 I heard of a lady the other day who had had an operation every year or so for five years. I wonder if she would have preferred to pay a small amount to *avoid* the operations?

There is no question but that money is important, and we need to use it wisely. But there is no sense in keeping a little money in

your pocket and then spending a lot of money on doctor bills. Sometimes it pays to *spend* money in order to make money, and you make money when you give your body the materials it needs to keep you strong and well, full of vim and vitality, long lived, with a youthful appearance and free from aches and pains.

* * * * *

While his audience applauded, the Educator sat down, and then one of the older representatives said, "You give a good lecture, Mr. Educator. I think I cover the same ground in my lecture, only I like to quote more from the article ARE WE STARVING TO DEATH in the *Saturday Evening Post* of Sept. 1st, 1945.",

"That is an article every man, woman and child in the world should read," said Mr. Rehnborg. "I suppose that is why the Post printed it. The article shows that we actually are starving, even with full stomachs, and it makes it clear why everyone needs such a product as ours, to supplement his present diet, and no matter how good he thinks that diet is."

"I always like to emphasize the fact," said another representative, that money spent for our product is part of the food budget, and everyone should allow enough money for food to mainfain his body adequately, and to keep his family strong and well, even if he has to skimp in other ways."

"A person might just as well do that," said another representative, "because if he doesn't he'll pay in other ways. And not just money, either. In the course of my work, and all in the same
2145 week, I found three boys, four and five years old, who would not quit wetting the bed. They just would not, no matter what their parents did. They tried starving them, and no water after 4 o'clock, and they tried punishment and bribes and shame, but nothing worked. I started each boy on NUTRILITE, and inside of 60 days all three have quit wetting the bed. One of the fathers said it was worth almost anything to have his boy rid of the enuresis.'

"I have a woman who is holding her blood pressure to normal on our #10. She says it's the best investment she ever made."

"I have seen only one case of high blood pressure that would not respond to the use of our product," said Mr. Rehnborg, "and that was a case of essential hypertension."

"A doctor tells me that if a patient with neuralgia is given injections of vitamin B in high potency, it will stop right now."

"They tried that at Cal Tech," said the Biochemist, "and they found it took from one to six months. A better way is to give larger doses of all the vitamins."

"I have a lady with neuralgia, using our product, and she hasn't been helped yet."

"I tell people that there is no incurable ailment," interjected a representative, "but occasionally we find an incurable patient."

"The surprising thing," said Mr. Rehnborg, "is not that there is a case now and then that our product doesn't seem to help. That is to be expected. The remarkable thing is that so many people, with such serious conditions, *are* helped. As a matter of fact, nine out of ten people with neuralgia get rid of
2146 it entirely by the use of our product."

"I know you people get many unsolicited testimonials," said a new representative, "I received one in the mail the other day. This lady had been out of the state for three years, and she had forgotten the name of our product. She explained that she took a course just before she left the state, and had had marvelous results. She said it did wonders for her. She was overweight and lost 15 pounds, her energy was increased, and she actually enjoyed her work. Now she has slid back, and is very anxious to get started again. She is delighted with our new plan of the year course at a reduced price."

"Here is a case for the records," said a representative not yet heard from. "Someone speaking of eczema a while ago made me think of it. Our old dog had a fungus infection of the skin, and a tumor. I gave him our product for two weeks, and now you should see him. Skin all clear, and the tumor much smaller."

"It works on cats, too," said the Chairman. "We have a beautiful Siamese cat, with four cute little kittens. The mother cat suddenly became ill, could hardly get up, limped badly when she walked, and most of the time just lay and looked at us with big imploring eyes. I gave her half a capsule of #10 night and morning, mixed with her food. That was four days ago, and already she walks around with almost no limp; and is definitely better. Now I give her half a #10 capsule each morning."

"Speaking of the dog's tumor reminds me of a very serious case," said the Educator. "This lady was almost 70 years old with heart trouble and a tumor. She couldn't get her hands up to comb her hair and was taking digitalis and stimulants all the time.
2147 She sat listlessly among her medicine bottles, and said, 'Well, I've tried everything else, I don't see why I shouldn't try your product. So she started on NUTRILITE. Four months later, when I called, there were no more medicine bottles. Instead —and remember she was almost 70 and four months before she couldn't get her hands up to comb her hair—she showed me the kitchen and bath room she had redecorated herself, and said she was going to learn to drive a car!"

"Do people with arthritis need calcium?"

"Yes," said Mr. Rehnborg, "they must have calcium. Many medical men say now that although they used to think it was due

to too much calcium, now they think arthritis is due to a calcium deficiency, or a wrong distribution of calcium."

"My worst case was a woman in Ontario," said the Educator. "Her hands were swollen and they said that if anything would help her, it would have to be a miracle. The second month she used our product, she ran up to me and said, 'Look! Look at my hands! (They were almost normal in size.) And look at the big wash I did this morning!"

"How important is calcium to the average person?"

"About 85 percent of all Americans are deficient in calcium. That goes for children, too," replied Mr. Rehnborg.

"I suppose children don't need as much of our product as adults."

"No," replied the Biochemist, "the requirement is a factor of weight."

"I talked with the mother of a boy of eleven, who was 2148 being given dilute hydrochloric acid for his digestion. He wouldn't eat and was never hungry. I wish I had taken his weight when he started using our product a year ago. Anyway, he is healthy and robust, with a good normal appetite.

"As a sort of summary of what we have heard this noon," said a new representative, "I wonder if Mr. Rehnborg would give us a list of the common ailments which have been cured or greatly helped by the use of our product?"

"I'll be glad to," said Mr. Rehnborg. "I have kept a list of the troubles in which our product has been most effective, and although it helps in almost every case, these are the cases where we can be most sure that the user will get results:

Low blood pressure	Lack of ambition
Ulcers	Certain bone conditions
Mental depression	Nervousness
Pyorrhea	Nosebleed
Muscular twitching	Insomnia (sleeplessness)
Rickets	Allergies
Worry over small things	Asthma
Tonsilitis	Restlessness
Hay Fever	Bad skin color
Sensitiveness to noise	Poor appetite
Underweight	Biliousness
Easily tired	Neuritis
Gas in stomach	Night blindness
Cuts heal slowly	Migraine
Faulty vision	High blood pressure
Headache	Sinus trouble
Constipation	Lack of concentration
Anemia	Dental caries
Boils	Irregular heartbeat

Flabby tissues	Colitis
Hysterical tendency	Craving for sour foods
Eczema	Arthritis (rheumatism)
Overweight	Neuralgia
Faulty memory	Deafness
	Subject to colds

"But we must remember," continued Mr. Rehnborg, "in any particular case nobody can tell beforehand what results will be secured. All we can do is give the body the materials it needs to work with, and then wait and see what happens."

"That is certainly an important list, anyway," said the new representative. "And what interests me is that since this product helps with all those troubles, since it is not a medicine, since
2149 it helps you even if you don't think you need it, and since it cannot possibly do anyone any harm, I, for one, shall use it all the rest of my life to eliminate the minor troubles I have, and to avoid the more serious diseases you mention. And as for those people who are now ill, I should think we would only have to tell these people about NUTRILITE, and they would take our product away from us."

"As a matter of fact, that is just what often happens," said one of the older representatives. "One man took the sample bottle I was showing him, opened it, and swallowed one of the capsules. I said, 'Don't you think you should know how much it costs before you start your course?' He said, 'I don't care what it costs—I want to get well!'"

"I can believe that," said another representative, "especially when there is so much being written just now, emphasizing the importance of an adequate diet. There is a good article called FACTS ABOUT HEALTH, in "Everybody's Digest" for August, 1945. I happen to have it here, and I'd like to read part of it. It says:

"There are those of us who are unaware of any dietary lack, who 'judge the state of their nutrition by the fullness of their stomachs,' as Dr. Sebrell of the National Nutrition Program puts it, 'and by the amount of fat they have stored away, instead of by health and physical fitness.'

"Malnutrition is like an iceberg; the greatest part of it is not visible. Only when it reaches advanced stages and we see war pictures of starving children do we realize what an acute lack of necessary food elements may do.

"All that medical science has learned is unavailing if the individual does not take advantage of it. Doctors agree that each individual should begin his own personal health and physical fitness campaign. . . . 'Chronic diseases start insidiously in apparent health, Medical Journal reports testify. Through . . .

nutritional science we can eliminate the half-health, half-strength, half-happiness which is the result of a diet not quite good enough."

* * * * * *

This seemed to be a good note on which to close, and the meeting was adjourned.

2150 SOME IMPORTANT CONCLUSIONS

It is noteworthy that the babies in China did not improve as they should until the plant extract or concentrate, developed by Mr. Rehnborg, was added to their diet.

This same plant concentrate, when added to the diet of the adult Europeans in the Orient, gave them good health and enabled them to withstand the deteriorating effects of living in China.

In 1933, when NUTRILITE was first sold in the United States, it consisted entirely of the plant concentrate. In preparing this concentrate plants known to contain the highest percentage of all the various food factors required by all animal life, are grown in especially prepared soil. The leaves are harvested and dehydrated, yielding 300 pounds of dried leaf to each ton of fresh plants. These dried leaves are then subjected to a variety of solvents which extract from them the nutrilites, leaving behind a residue of cellulose which has no food value. Less than six pounds of this concentrate of nutrilites are secured from each ton of fresh plants, and it is this concentrate which contains, as far as science can determine, all the vitamins known and unknown, discovered and undiscovered, together with all the important food factors such as bios, inositol, plant auxins, chlorophyll, and many other nutrilites which cannot be purchased in the drug store.

This concentrate was added to the diets of people in California, where the product was first introduced into the United States, and their deficiency diseases were eliminated in case after case.

2151 It was Mr. Rehnborg's plan to continue to produce just this concentrate which had amply demonstrated its ability to correct the body chemistry and to enable a person's body to throw off the deficiencies. But at this time the synthetic vitamins were being developed and used with beneficial results, so it was argued that the NUTRILITE concentrate, good as it was, would be even better if it had added to it the drug store vitamins in high potency and in proper proportions. The drug store vitamins were then added, and it was found that the product was improved. The advantage of the natural concentrate is that it contains the various vitamin complexes, *all factors* of which may be required to bring about health and strength in a particular individual, whereas a synthetic vitamin (the kind you buy in the drug store) is always *one single factor* of the complex.

Dr. Quigley, famous Omaha dietitian, in his book THE NATIONAL MALNUTRITION, says:

"In the selection of a concentrate, it is important to remember, first, that the original deficiency is invariably multiple in origin. The diet has usually been deficient in not one or two, but in many or all of the vitamins. This is being further established every day, in both the research laboratory and in clinical practice.

"It is essential that the concentrate contain all of the vitamins, both known and unknown. Undoubtedly many of the vitamins essential in human nutrition have not as yet been identified
2152 or synthetically reproduced. For this reason no synthetic preparation * can completely replace the vitamins in which the average persons may be deficient."

It is consequently the *plant concentrate* in NUTRILITE which sets it apart from all other diet supplements and which is the component which is difficult and expensive to make. All the benefits people derive from the drug store vitamins in NUTRILITE can be secured also from the same vitamins in the same potency purchased in any corner drug store. But in no drug store in the world can a person buy all the nutrilites contained in the plant concentrate of NUTRILITE.

The sufferer of dietary deficiencies and deficiency diseases has the problem of getting into his body all the basic food factors which either were never in his food to start with or which have been partially removed in some way. These basic food factors must be in his food in order that he may be well and strong.

NUTRILITE PRODUCTS containing all of the known vitamins, minerals, bios, inositol, plant auxins, chlorophyll and other nutrilites, is the answer to this problem.

Arlington, Calif.
Nov. 6, 1945.

To Whom It May Concern:

I am the mother of 10 year old Joyce Larlene Grimes, who, since birth, has been a very thin, nervous and delicate child. Her appetite has been poor. We have had her under doctors' care and on some tonic or vitamin preparation at all times.

On April 21st of this year, Joyce met with a very serious accident. She was struck on the left side of the head by a 700 lb. bar, fracturing her skull. She also received a double fracture of the right foot and a broken collar bone.

She was in a very serious condition for some time. She was operated on for the skull fracture and remained in the hospital a month.

---

* Most drug store vitamins are synthetic.

We had brought her home just a few days before we met Mr. Stivers. He told us of Nutrilite, and its possibilities. We took a years order and started Joyce on them right away.

She is in her fifth month now on the Nutrilite course. She has a wonderful appetite. She is no longer the extremely nervous child she was. Her skin is no longer dry and rough. The doctors say she has made a remarkable recovery from her accident. We feel Nutrilite deserves much credit for this. And we are very anxious to see the result after she has taken the year course.

Sincerely,

MRS. J. A. GRIMES.

I give you my Permission to use this letter.

2154 Sept. 29, '45.

I want to tell some one how much the Nutrilite has helped me. I have taken Number 10 about five wks. and am very much surpr-sed to see how well I am. I am 76 years old & have just come back from a trip through Oregan. was gone 2 wks. & had the care of an old lady 89 years old. My rest & sleep was broken & on my return home rode all nite & the next nite did not get to bed until 10:30. Wake up next morning feeling fine. I have not felt so well in many years. I could not of taken this trip if I had not had some help & I recommend this to any one as I feel sure it will help. I give Nutrilite the credit, pain gone & lots energy to carry on.

CARRIE R. SAMPSON,
5862½ Kansas Ave.

I hereby give Nutrilite Products permission to use this letter.

CARRIE R. SAMPSON,
5862½ Kansas Ave.,
Los Angeles 44, Cal.

2155 105½ N. Spruce Street,
Montebello, California.

Dear Mr. Stivers:

Nutrilite has been a lifesaver to me. I am in my 6th month of pregnancy and during the first three and a half months was bedridden. I was unable to eat at all and consequently became very weak and run down. The Doctors were unable to help me and it was feared I would't be able to carry a baby at all. I had been the same way thru the whole nine month period with my first baby so naturally I began to think it was going to be the same again. But, a friend came to my rescue when she told me about Nutrilite. Miraculously enough, my recovery began immediately and in two weeks' time I was up most of the day and gaining weight and

strength. Of course, I still have days when I am far from myself, but I shudder to think of where I'd be if it weren't for my discovery of Nutrilite.

If this letter can be used to help anyone else you have my permission to use it.

Sincerely,

WINIFRED MCPHERSON.

2156

6166 Strickland Ave.,
Los Angeles, Cal.
April 17, 194 .

Dear Mr. Compton:

I am glad to report that Barbara is now working. You were correct in urging us to use the highest potency Nutrilite when she was compelled to quit school on account of tuberculosis.

Barbara stands her work well and her weight is about normal for her age. Along with prayer I give Nutrilite the credit for her recovery. She now takes only the lower potentcy vitamins and minerals with calcium.

You have my permission to use this letter as you wish.

Yours sincerely,

M. A. COMBS.

2157

Chatsworth, Illinois, June 20, 1946.

Mr. Frank J. Compton,
1815 Winona Avenue,
Los Angeles 27, California.

Dear Mr. Compton:

For a number of years I was crippled with arthritis and neuritis. My knees were so stiff I could not go up or down stairs. My hands were also effected so that I could not lift anything. I would get so bad that they had to take me to a Health Resort for baths and treatment. This would ease my condition temporarily but it would only last a short time.

About five years ago upon your suggestion and recommendation I began taking your Nutrilite Products. I decided that I would give it a fair trial. In about five or six months I could see that I was making considerable improvement and it was not long until the stiffness and lameness in my knees left me. My hands also improved greatly, and I have not been to the Health Resort since I started taking your product.

No one knows, except a person afflicted with arthritis, what intense suffering one has to endure. I still use Nutrilite and gladly recom-

mend it to anyone suffering from arthritis or any other form of rheumatism.

You have a steady customer because I know it has kept me going and relieved me of my suffering.

Yours very truly,

MRS. FRANK H. HERR.

Mr. Compton:

You have my permission to use this letter in any way you wish as a testimonial regarding the use of Nutrilite Products.

MRS. FRANK H. HERR.

2158

Bakersfield, Calif.,
Sept. 9th, 1946.

Dear Mr. Fillion:

Replying to your inquiry as to how I have benefitted by using your Nutrilite Supplement I would say that after taking it for seven months I feel like a different person entirely.

I was badly troubled with Constipation when I started, and had to take purgatives most of the time. Now I am as regular as clockwork. If your Nutrilite had done nothing more than this for me I consider it was worth the cost of it.

In addition I suffered severely with nervous indigestion. My stomach just wouldn't digest my food properly, and it pained me greatly a good part of the time. I suffered from gas also. Now I enjoy my meals, with no worry about after-effects. My nerves are so much better too and I sleep fine.

I am so much better that I am going to continue to take Nutrilite for the balance of my year, so as to be sure I will completely eradicate the trouble from my system.

You may use this letter, if you wish, to let other sufferers know how good Nutrilite is.

Very truly yours,

CHAS. GIBSON.

Are We Starving to Death?

By NEIL M. CLARK

Are We Starving to Death?

By NEIL M. CLARK

An eminent soil doctor warns that, unless we attack the problem of mineral-depleted land on a national scale, we face slow extinction from "hidden hunger."

WHEN Jim was driving me to the station, he abandoned the old-college-days kidding attitude that he had maintained at dinner before his wife and daughter, and spoke seriously of his personal tragedy. He mentioned his father, who had lived to be eighty-six and was strong and active almost to the last. "My aunts and uncles, too," he said—"none of them died under seventy-five. And look at me," bitterly. "Just look at me!" I had already looked and been shocked. "It's my heart, the doctor says. Why should I have a bad heart? I've always taken care of myself. But here I am, a little past fifty, and I know as well as anybody that I might pop off at any time. Neil, can you tell me—can anybody tell me why I'm not so good a man as my dad was—why I'll never live as long as he did?"

I couldn't, and didn't try. It occurred to me, too, that I couldn't explain why Jim's wife has been anemic as long as I have known her, nor why their daughter, as a child, gave signs of rickets.

Two things in the next few weeks reminded me of Jim's desperate questions. While I was having an inlay replaced, my dentist took occasion to say that his own teeth weren't so good as his Texas father's, and that few of his patients had teeth as good as their parents'. I wondered if that might not have some bearing on Jim's questions. Still later I was sitting in Dr. Wm. A. Albrecht's office at the University of Missouri, in Columbia, listening to an absorbing and almost unbelievable story about health in America and the particular chapter in that story which he has helped to write, and I interrupted to mention Jim. "Could it be," I asked him, "that he is simply hungry?"

"It could be," Doctor Albrecht answered.

I had come to ask Albrecht if America could expect to keep on eating well. "America," he said grimly

Dr. Wm. A. Albrecht *(right)* and Dr. H. S. Wittwer checking results of some soil tests on spinach.

stand that more diseases than they ever suspected could be traced to dietary deficiencies, and that many sick people were hungry people. They called it 'hidden

numbers many physiologists, physicians, surgeons and dentists among his close friends. He is a doctor of soil, a student and teacher of soil chemistry, head of the Department of Soils at the University of Missouri. However, he has never believed in hard-and-fast boundaries between sciences, and when it became clear there must be a tie-up between human health and the soil, he made that the major goal of his research. How, he asked himself, do soil and plants work together? Strangely, though agriculture is mankind's oldest industry, nobody knew; not as scientists insist on knowing. What, Albrecht asked himself, is plant health, and how does it depend on soil health, and what does it mean for those of us who can't explain or doctor our chills and fevers away?

Two things that Albrecht did have helped to revolutionize scientific thought and practice in this whole field. First, he developed a complete hypothesis as to why some soils in constant agricultural use become sick and others stay well; some of the soils of China have been in yearly use for forty centuries and are still healthy. Next, he developed a fully controlled technique for testing treatments designed to produce healthy soils and healthy plants. These two steps are somewhat comparable to the development in medicine of the germ hypothesis, plus a laboratory technique for finding out how germs act. To describe Albrecht's hypothesis and technique in detail would take more space than can be allowed in this article. But enough must be told for the reader to understand in a general way what happens. Perhaps the easiest approach is through Hans Jenny and his experiment that failed.

Jenny, fresh over from Zurich, was one of Albrecht's research assistants from 1927 to 1936; now he is asso-

He had the imagination to use the new technique to good purpose. In later experiments and through long hours of reflection about results, he developed his complete hypothesis as to what goes on in soils, how plants and soils work together, and how soils become sick and make plants, and then men and women, sick. A plant, he points out, obtains only a small part of its total growth from soil materials; the rest comes from air, water and sunshine. He likes to tell his students about the classic experiment of the seventeenth-century chemist, Van Helmont, who planted a five-pound willow in 200 pounds of earth, never added anything but water, and after five years found that the willow weighed 169 pounds and the earth still weighed 200 pounds, less about two ounces.

"What the soil contributes to growing plants," Albrecht says, "is very little in amount, compared with what air, water and sunshine provide; on the average, it amounts to about five parts in one hundred. But that little is absolutely essential to plant and human health. For soil materials are 'grow' foods—the minerals that make bones and teeth in animals, and keep us provided with a strong structure, without which we're like an automobile built of soft tin. Air, water and sunshine, on the other hand, make the 'go' foods—fuel and energy to keep the machine running. There's no indication we'll ever run short of the airborne elements in our foods. But right now we're running short of soil-borne elements. And that's our trouble. When we're short of minerals, we're short of basic health. Short of vitamins, too, for there's some unknown connection between minerals and vitamins. We know when minerals in a soil are abundant, vitamins usually are abundant in the plants that grow there."

The next fact to remember, Albrecht says, is that plants will make a lot of growth, just as you and I will, even when certain wanted minerals are missing. But the plants themselves will be different. Thus, cabbage is one thing if grown on one kind of soil, another if grown on another kind of soil. There are more minerals in it, or less, depending on the minerals in the soil, and apparently more or less proteins and vitamins in it. The same is true of carrots, beets, peas, oranges, apples, potatoes, sweet corn or any other plant product we use as food. The calcium concentration of a lettuce leaf can be varied twofold and spinach threefold, according to the calcium in the soil. Popeye would never jitterbug to the Coast on spinach grown in mineral-poor soil. Albrecht has played with many vegetables in research, varying mineral content up or down by varying soil nutrients.

The same mineral variations occur in grasses and other plants eaten by domestic animals, and what they

MISSOURI AGR. EXP. STATION PHOTOS

These soybeans, exposed to the same fungi, behaved as four people might during an epidemic: One got very sick, the next less so, the third had a mild attack, and the fourth proved immune.

eat, in turn, affects their products which we eat. Our beefsteaks, pork chops, lamb roasts and omelets can be mineral-shy, if the cows, hogs, lambs and chickens were shortchanged on their minerals.

"Nations or individuals," Albrecht says, "men or animals, we are what we eat. Breeders raise big tough mules in Missouri because of lime-rich soils that make tough bones and bodies. Farmers use a lot of those mules down South in the cotton fields, but they don't raise them there. Kentucky raises far better race horses than Florida, though some of the country's finest race tracks are in Florida. It's a matter of soil. The Japanese have a very high illness and death rate; colds are almost universal at certain seasons. The soils of Japan in large part are mineral-poor. That's the main reason why the Japs are such fish eaters; they have to eat fish to get needed minerals and vitamins. We tried a starvation experiment with male rabbits, which are naturally great breeders. When we fed certain pens of rabbits a mineral-deficient hay in their diet, we reduced the males in a few weeks to the point where they wouldn't look at a woman rabbit. Other rabbits, kept on a similar but mineral-rich diet with hay from treated soil, were regular wolves. By reversing the diets, the wolves became woman-shy, and the tame cats became wolves. Lambs fed mineral-rich hay from treated soil made nearly three times as much gain in weight in a given time as other lambs from the same flock fed the same amount of hay from mineral-poor soil. Elephants in Burma and Ceylon, when fed on sugar cane, a mineral-poor diet, quickly become unable to do the heavy timber moving required of them. A properly mineral-rich diet predisposes a man to health and normal functioning: And the healthier we are, the better we resist diseases that ought to lay us low."

To demonstrate this in plants, Albrecht took me to a greenhouse to look at an experiment. Several varieties of spinach were being fed by the colloidal-clay technique, on different diets, ranging from mineral-rich to mineral-poor. A little bug, the thrips, had somehow found his way into the greenhouse, and rows of the poorly fed spinach plants were suffering from his attacks, but not even one of the richly fed plants showed a sign of attack. They had something that enabled them to resist. It's the same, Albrecht said, when John and Jane ride on the subway and half the passengers have colds. By evening, John is coming down with a cold too. Jane stays well. The same bugs buzzed her. But somehow she had more resistance. "We are what we eat."

Another fact to remember, Albrecht said, is that soils under certain conditions easily lose a large part of their minerals. The loss

may occur in several ways. Under heavy rainfall, minerals tend to leach out and disappear in the ground water. Under heavy cropping, too, large quantities of minerals can be taken away when the crops are removed. Albrecht once calculated that a 200-acre farm producing so many bushels of oats, corn and wheat, and so much alfalfa and grass, gave up minerals which, if bought at current prices, would have cost $1630 for just one year. At that rate, if nothing else happened in the soil, two or three crops could exhaust a farm.

Luckily, two things do happen. First, farmers put back minerals in the form of natural manures and fertilizers or by plowing under green crops and crop residues. Second, the soil itself possesses a mechanism for releasing minerals naturally found in most soils, and making them available to plants. Just how this is done is part of Albrecht's revolutionary soil hypothesis. But this is what's important for us—a farmer can mine his soil by overcropping it faster than it can renew itself.

There's an interesting plot in Sanborn Field, in Columbia, which Albrecht took me to see. It's called Plot 9. Since 1886, when Sanborn Field was set aside for crop studies, Plot 9 has been planted to wheat every year. The grain and straw are always removed. Nothing is ever put back—no fertilizer, no manures, no minerals. At first, Plot 9 yielded handsomely, but as the years passed, the yearly crop got smaller and smaller, poorer and poorer. Now the soil is so sick that it can't recover enough mineral strength between crop seasons to make wheat annually, and yields only every other year.

These are Albrecht's basic facts. Much has been left out, but I have said enough, I think, to show the nature of the invisible enemy that is attacking our soils, our plants, our domestic animals, you and me. We have drawn on the mineral bank more than we have paid in, and bankruptcy is coming fast. Diseases are beginning to multiply. Heart ailments that can be traced to diet are going up alarmingly. Diabetes, arthritis, cancer, anemia, dental caries and many of the more obscure ailments have struck with increasing severity. Millions of us try to supply what we vaguely feel is wanting, by buying pills at the drugstore. Even if we aren't sick enough to see a doctor we may be only half-well. A study in a California aircraft plant showed a correlation between fatigue, work spoilage, reduced output and absenteeism, and shortages of vitamins A and C in workers' diets. Medical progress has been wonderful, but one of the more significant medical discoveries is the fact that almost any disease can be produced experimentally by faulty food. Today, doctors in increasing numbers are the ones who are saying that the tide is getting too strong for cure alone. There must be prevention. And prevention starts in the soil.

The process of decay has gone faster and further in some parts of the country than others. Albrecht cites the fact that the South has a heavy rainfall and a lot of leaching and cropping to reduce soil minerals rapidly. The South, consequently, is the part of the country where farmers use the most fertilizer; they have to. But even so, input in most places has fallen behind outgo, and Albrecht says it's a direct result of that that makes so serious the Rountree report that in one Southern state no less than 70 of 100 potential inductees for military service in this war were rejected on physical grounds whereas in Colorado, where mineral depletion has been less, 70 out of 100 were accepted. Those Southerners simply were not eating well enough.

The problem, Albrecht says, is rapidly reaching the size of a catastrophe, and if carried much further, could mean national suicide. Some future Gibbon, he says, might sit down to write The Decline and Fall of the American Republic. Soil health is that important. It could happen here.

Can the tragedy be prevented? If so, how? Not all the steps are known yet, Albrecht says, but the direction we must travel is absolutely clear. We must restore our soil bank account. Our soils, like ourselves, must be fed back to health. That's a tremendous subject. No two soils have exactly the same history, topography and climate, and soil-mineral differences may occur within the same fence lines. Albrecht visited a famous Hereford farm in Missouri and found an entire beef herd seriously afflicted with diseases that doctoring seemed unable to cure. On another farm near by he found a similar herd in practically perfect health. Oddly, the herd on the second farm was started by animals born and brought up on the first farm. The health difference was a soil difference. The first man had been operating for fifty years on the same farm and had not maintained soil minerals. The second man, a newcomer, had taken sound advice and built up his soils. The proper feeding of soils, Albrecht points out, is complicated by the fact that a greater variety of minerals is needed by soils than we used to think. At least fourteen elements are needed for plant construction and sixteen for animal body building. Most of these are needed in only tiny amounts, and are called "trace elements"; but though little is needed, if that little is missing, the soil, plants and creatures feeding on the plants may be noticeably sick.

Remarkable work has already been done in treating sick soils. After adding a pinch of manganese in certain fields, a food processor harvested tomatoes with triple the vitamin C content. A little boron around apple trees in the Northwest apparently has doubled the vitamin A content of the fruit. A retiring genius named Albert Carter Savage has been experimenting for years in Kentucky with mineralized vegetables, and a number of sick people fed at his farm have achieved near-miraculous cures. Citrus groves in Florida are planted on sand under fifty annual inches of rain, and to furnish the trees the copper and zinc they can't find in the soil, they are spoon-fed—the minerals are sprayed on and the trees take them in through their leaves. The iron content of milk has been increased from twenty-one to fifty-five parts per million by proper feeding of soils grazed by the cows. But Albrecht warns that there are no soil cure-alls. "The soil factory," he points out, "runs by processes more subtle than anything in a man-built factory. Much remains to be known. Lime is generally good on soils, but it's possible to lime too much. Boron helps to make oranges, but an overdose can make them sick." All these things are to be explored. But Dr. Jonathan Forman, editor of the Ohio State Medical Journal and a serious student of soils and nutrition, says confidently that there is no reason why the average man, if "well-bred and well-fed," should not live to be a hundred and enjoy good health.

The city man is perhaps more deeply concerned in all this than the country man, for he is not a producer of his own food and must depend absolutely on others for the mineral richness of what he eats. So the city must learn to be tolerant of new steps that farmers must take, and of the possible consequences of those steps to the city man's pocketbook. Hitherto, Albrecht says, the farmer, thanks to the system of food distribution, has often been forced to mine his soil. "Hardly any farmer," he says, "willfully destroys soil fertility. But he has been forced. The grocer says, 'I can pay only so much.' He passes that buck to the wholesaler, the wholesaler passes it to the commission man, the commission man passes it to the farmer, and the farmer passes it to the land. There's no other place. He proceeds to use his soil like a private gold mine, not as a property affected with an enduring public interest. We must enable farmers to keep on using their soil to produce food, and at the same time maintain mineral-rich fertility."

Our war-expanded chemical industry, Albrecht thinks, will find its greatest peacetime opportunity in making soil-restoring products that will help to restore our national health. The greatest challenge of all, he says, is to research.

January 28, 1949.

The Honorable Oscar R. Ewing
Administrator
Federal Security Agency
Washington, D. C.

My dear Mr. Ewing:

I believe that the Food and Drug Administration may request you to make a decision of probable cause which can be used as a condition precedent to multiple seizures under the Food, Drug and Cosmetic Act of 1938 against Nutrilite Food Supplement, a product for which my client, Mytinger and Casselberry, Inc., of Long Beach, California, is the exclusive distributor.

I believe that the basis of the request by the Food and Drug Administration will be that certain labelling or advertising used by my client are misleading. We are certain that the Food and Drug Administration is incorrect in its claim that my client's advertising and labelling are misleading, and we therefore request that you give Mytinger and Casselberry, Inc., a hearing at which they may present their side of this dispute before you make any decision of probable cause in this case.

Very respectfully yours,

CHARLES S. RHYNE.

Zone 25

Feb. 11, 1949.

Dear Mr. Rhyne:

Your letter of January 28, 1949, addressed to Administrator Ewing requests that there be no finding of fact or probable cause to the effect that Nutrilite is misbranded until a hearing has been accorded to Mytinger and Casselberry, Inc., of Long Beach, California.

I presume that you refer to a finding of fact under the Federal Food, Drug, and Cosmetic Act for which provision is made in section 304(a)(2) of that Act. This section provides for a finding that the labeling of a misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer when the Administrator has probable cause to believe such from facts found, without hearing.

In the absence of Administrator Ewing, because of illness, I on January 28, 1949, made such finding of fact with respect to the misbranding occurring in the labeling of the drug, Nutrilite, or Nutrilite Food Supplement as distributed by the firm of Mytinger and Casselberry, Inc., and their representatives. The labeling involved is the booklet "How to Get Well and Stay Well". The partnership Mytinger and Casselberry as well as William S. Casselberry, Lee S. Mytinger, and Carl F. Rehnborg, as individuals, were accorded hearings on July 15, 1947 and on September 16, 1947, at which time they were attended by counsel Lee J. Myers in their appearances before the Chief of our Los Angeles District.

In addition to personal appearances, written responses were filed by Attorney Myers on behalf of Lee S. Mytinger and William S. Casselberry, in which it was set forth that Nutrilite products are foods for use as a supplement to the regular diet, that they do not cure and are not offered for cure for anything. Mr. Mytinger stated that he would personally revise all of the labeling so as to bring such printing into harmony with the Food, Drug, and Cosmetic Act.

Subsequently on November 3, 1947, Mr. Myers, by letter, represented to the Food and Drug Administration that the various pamphlets heretofore distributed by the firm had been destroyed and discontinued and that the booklet, "How to Get Well and Stay

Well" has been entirely revised and the old copy destroyed.
2162 Actually the current edition of "How to Get Well and Stay Well" is replete with numerous representations which classify the Nutrilite products as drugs for the treatment of serious disease. The first 36 pages of "How to Get Well and Stay Well" contain essentially the same phraseology as is involved in the earlier editions of the booklet. The recent addition to the booklet of several pages substituted for original pages from 37 to 54 do not mitigate the unjustifiable impressions established by the first 36 pages.

Sincerely yours,

J. DONALD KINGSLEY,
Acting Administrator.

February 18, 1949.

Mr. J. Donald Kingsley
Acting Administrator
Federal Security Agency
Washington 25, D. C.

Dear Mr. Kingsley:

I have your letter of February 11, 1949, in which you reply, as Acting Administrator of the Federal Security Agency, to my letter of January 28, 1949 addressed to The Honorable Oscar R. Ewing, Administrator of the Federal Security Agency.

I respectfully again call your attention to my letter of January 28 and ask that you note that no reference is made therein to "find-

ings of fact" under Section 304 (a) (2) of the Food, Drug and Cosmetic Act of 1938. My letter had reference only and exclusively to the decision of "probable cause" which must be made by the Administrator as a condition precedent to multiple seizures under Section 304 of that Act. Only the Administrator can make such a decision, of "probable cause", although "findings of fact" may be made by minor employees; and my request was that my clients Mytinger and Casselberry be granted a hearing *by the Administrator himself* before he made such a decision as to the character of the labelling used by my clients.

Your attention is specifically called to the fact that under Section 304 (a) (2), facts may be found "without hearing" but the words "without hearing" do not apply to the Administrator's "probable cause" decision. I am certain that if you will but read the language, this interpretation will be found to be the correct one.

It is shocking that you now claim that the hearing on July 15, 1947, which was held before one of your chemists in Los Angeles under Section 305 of the Act and for an entirely different purpose, could possibly be a hearing *by the Administrator* before a decision of probable cause in the instant case. The hearing on July 15, 1947, was chiefly concerned with an alleged deficiency of vitamin B_1 in one of my client's products, and only slightly with my client's labelling. This charge as to the Vitamin B_1 was clearly disproved by an analysis made by an independent laboratory, and nothing further whatever has been heard from it. The booklet "How to Get Well and Stay Well", in its present form, was not in existence at that time. It is quite obvious from your letter that you have confused the early edition of "How to Get Well and Stay Well" with the current edition, and it seems doubtful from the very nature of your comments that you have been presented with an analysis of either edition of the book. I also can tell you that just as the charge of a shortage of Vitamin B_1 was completely refuted as a result of the July 15, 1947, hearing, the charge now made in the decision you made herein would be completely refuted if the Administrator would but give my clients the opportunity to refute it at a public hearing.

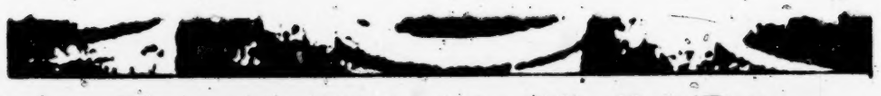
2163-A. I am certain that your file will reveal that the hearing of September 16, 1947, was also scheduled under Section 305 of the Act and that Mr. Born of your Los Angeles office advised that a written response to the citation there issued was to be the procedure rather than a hearing, and this response was made by Lee J. Myers, attorney for my clients. No hearing was therefore held at all on September 16, 1947. A copy of the response by Mr. Myers will undoubtedly be found in your file. It is set forth in full in the affidavit of William S. Casselberry filed in the civil action now pending in the United States District Court for the District of Columbia, of which your General Counsel's office has a copy, as

we have been furnishing extra copies of our papers to the Department of Justice for that purpose.

I cannot believe that Mr. Ewing, who is known as a very able lawyer, would ever agree that the hearing under Section 305 *before one of your chemists* in Los Angeles for an entirely different purpose, could possibly be construed as a hearing under Section 304 (a) (2) *by the Administrator* on the question of probable cause here presented. I do not want to be argumentative, but are you not inconsistent when you say that no hearing is necessary yet argue that a hearing has taken place before your minor employees?

I note in your letter that you state in part: "I on January 28, 1949, made such finding of fact". The papers filed by the Department of Justice and served upon me contain three undated papers entitled "Finding of Fact" signed by Robert G. Butz, Medical Officer, Food and Drug Administration, and on a separate page of each, also undated, is a statement entitled "Conclusions" signed by J. Donald Kingsley, Acting Administrator, in which you say "I conclude on the basis of the facts reported above by Dr. Robert G. Butz, an employee of the Food and Drug Administration of the Federal Security Agency, that there is probable cause". There is a very serious and fundamental distinction between a decision or conclusion of "probable cause" and the "finding of fact" under Section 304 (a) (2), and it is quite evident that your attorneys agree with me in this or they would not have segregated the "finding of fact" and the "conclusion" with the "finding of fact" made by Dr. Butz and the "conclusion" by you as Acting Administrator.

Under Section 304 (a) (2), multiple seizures may be made when the misbranding has been the basis of a *prior judgment in favor of the United States* or when the Administrator has probable cause to believe from the facts found without hearing by him or any officer or employee of the Agency that the misbranded article is "*dangerous to health*" or that the labelling of the misbranded article is "*fraudulent*" or would be in a material respect "*misleading*" to the injury or damage of the purchaser or consumer. Your decision or "conclusion" of probable cause in the instant case is based upon your decision from facts allegedly found by Dr. Butz, without a hearing, that the labelling of Nutrilite is "misleading". I believe that you will agree that the claim of "misleading" is certainly a lesser charge than "fraudulent" or "dangerous to health", and that it is a charge more difficult to prove and on which there is more likely to be a difference of opinion. You therefore are taking the drastic action of multiple seizures of my client's product on the *weakest* of the four possible grounds authorized under the Act. Under these circumstances, is it not fair to give Mytinger and Casselberry an opportunity to appear before the Administrator to prove facts showing



at the University of Missouri, in Columbia, listening to an absorbing and almost unbelievable story about health in America and the particular chapter in that story which he has helped to write, and I interrupted to mention Jim. "Could it be," I asked him, "that he is simply hungry?"

"It could be," Doctor Albrecht answered.

I had come to ask Albrecht if America could expect to keep on eating well. "America," he said grimly, "is not eating well now."

The story that Doctor Albrecht laid before me is what I propose to tell in this article. In my opinion, it is of the deepest possible significance to Jim and to millions more in America who—whether classified 4-F by their draft boards, or kept from work at war jobs for days at a time by colds and other "minor" complaints, or suffering from this or that occasional ache or misery that they can't explain, but that often prevents their feeling up to par—have wondered why they don't have the abundant health to go with "the abundant life" that they have heard so much easy talk about. The story isn't all about Albrecht; he is one of many looking beyond quantity into the quality of the food we eat. The Federal Government has established a focal point for such research at the Department of Agriculture's Plant, Soil and Nutrition Laboratory, organized at Ithaca, New York, five years ago. But Albrecht has played pioneer and leader, and has, perhaps, been intimately familiar with more phases of it than anybody else in the country. The substance of the story is that an enemy has come among us unawares. It stalks us invisibly, strikes silently, is almost as hard to outwit as germs were when Pasteur revolutionized medicine by revealing their role in disease. The new enemy is never dramatic. It appears as a disease of the soil directly transmissible to man, but unlike its devouring cousin, erosion, it silts up no rivers to cause billion-dollar floods, digs no gullies to swallow up farms. It works away, but leaves no clear-cut sign. Fields that always have been green may be green still. But the same life is no longer in them.

"We began getting our basic facts," Albrecht said, "about the turn of the century. Nutritional research got under way. Vitamins were discovered. People got curious about the chemical properties of food. Cookbooks recognized health as well as appetite. Doctors, through experiment and observation, began to understand that more diseases than they ever suspected could be traced to dietary deficiencies, and that many sick people were hungry people. They called it 'hidden hunger' because people who ate three squares a day, and never knew what it was to ask for food and not get it, often suffered from it. One of the hidden hungers was for calcium, a shortage of which could cause rickets. There were many others. Goiter was hooked up with a shortage of iodine; night blindness with a shortage of carotene; anemia with iron—and possibly copper—shortage; thyroid troubles with a shortage of zinc; tonsillitis with a deficiency of silver; tooth decay with shortages of calcium, phosphorus, fluorine, and so on.

Dr. Wm. A. Albrecht *(right)* and Dr. H. S. Wittwer checking results of some soil tests on spinach.

"These discoveries," Albrecht continued, "led inevitably to another. Some of us, sometime, were bound to make it, for questions and conjectures popped into any thinking man's head. What could cause hidden hunger? A train of thought suggested itself. We satisfy hunger by eating. If we eat 'enough' and still are hungry, mustn't something be lacking in the food? How does nourishment get into food? Well, it must come by way of the flesh, fish or animal products we eat, or by way of vegetables, fruits, nuts, berries. Where do these foods get it? The final answer is: By a process of manufacture, p[illegible] grow[illegible], w[illegible] beats anything Ford has dreamed up. The end product of that biggest-of-all big business is a great variety of plants; its machine tools are soil, air, sunshine and water. You and I never could make a meal of sunshine and raw minerals, but plants can and do. Then we eat them or we eat animals grown by eating them. Plants are the earth's basic food factory and nourishment warehouse, and if something is missing from our food that we need for health, it must be missing or deficient in plants. Yes, but why is it missing?"

This train of thought took the affair out of the field usually thought of as medicine, and brought Albrecht and others like him in. Like Pasteur, who advanced medicine so much, Albrecht is not a doctor of medicine, though he has always been deeply interested and hypothesis and technique in detail would take more space than can be allowed in this article. But enough must be told for the reader to understand in a general way what happens. Perhaps the easiest approach is through Hans Jenny and his experiment that failed.

Jenny, fresh over from Zurich, was one of Albrecht's research assistants from 1927 to 1936; now he is associate professor of soil chemistry at the University of California. He was experimenting with soybeans fed different diets of calcium.

Albrecht proposed the method of the experiment, suggesting use of colloidal clay. Ordinary clay is found in most soils, but colloidal clay was something new; it was ordinary clay with every shred of plant food eliminated. It was hoped it might be useful in making pottery, bricks or other articles, but Albrecht conceived a use for it in studying the feeding habits of plants. He argued that he could add any plant food he wanted to, in any quantity, observe the effect on growing plants, and have an absolute check on cause and result.

So Jenny's experiment was planned. In certain pots he put colloidal clay with only a little lime; in other pots he increased the percentage of lime, making several test mixtures. He planted his soybeans, watched them sprout, and after several days came to Albrecht with a long face.

"I'll have to start over," he said; "so many of the beans are dying."

He did start over, using the same plan. But once more he came to Albrecht with a story of dying plants; some "disease," he said, was attacking them. He was ready to try again, but this time Albrecht went to the greenhouse with him and, after a look at the plants, suggested that Jenny take his notebook and jot down some figures. Albrecht counted the number of living plants in each pot, and Jenny wrote the numbers down. When these were compared, pot by pot, with the quantities of lime used, it was seen that almost all the plants died in the pots with least lime, but a gradually increasing number lived in the pots containing more lime. As far as the original purpose of Jenny's experiment went, it was a failure. But in another sense it was brilliantly successful, for it demonstrated that the colloidal-clay technique would serve Albrecht's ends.

(11628)

according to the calcium in the soil. Popeye would never jitterbug to the Coast on spinach grown in mineral-poor soil. Albrecht has played with many vegetables in research, varying mineral content up or down by varying soil nutrients.

The same mineral variations occur in grasses and other plants eaten by domestic animals, and what they

diet, we reduced the males in a few weeks to the point where they wouldn't look at a woman rabbit. Other rabbits, kept on a similar but mineral-rich diet with hay from treated soil, were regular wolves. By reversing the diets, the wolves became woman-shy, and the tame cats became wolves. Lambs fed mineral-rich hay from treated soil made nearly three times as much gain

gers have colds. By evening, John is coming down with a cold too. Jane stays well. The same bugs buzzed her. But somehow she had more resistance. "We are what we eat."

Another fact to remember, Albrecht said, is that soils under certain conditions easily lose a large part of their minerals. The loss

CHART BY WILLIAM CAMPBELL

How to starve on three big meals a day. *Upper:* **Soil deficient in minerals produces a crop similarly lacking; the livestock raised on it, and you who eat the livestock, suffer from "hidden hunger."** *Lower:* **Mineral-rich soil means fuller growth and sturdier health for the crop, for the livestock and for you.**

2159c

that your decision that there is "probable cause" to believe
2164 that the labelling of Nutrilite is "misleading", is an erroneous one? That is all we ask.

That your whole case against my clients is built on a rather weak and dubious grounds is shown by the statements of your Counsel in the injunction case pending in the local District Court, for he stated your case as follows:

> "This literature accompanying the product, in our view, conveys to the ordinary person, although not perhaps to the health expert, judge or attorney, the impression, definitely, that the product, since the ordinary person suffers from vitamin deficiencies, when taken will retard and ward off all the common diseases and therefore if you have the common diseases you can get rid of them by eating this magic Nutrilite."

We dispute his contention as to the "*impression*" conveyed to ordinary persons by my client's literature. He admits all may not agree with your conclusions but labels them as experts, judges and attorneys. If given an opportunity we can show the Administrator that an ordinary person would not gain the "*impressions*" contended for and that an analysis of the literature itself disproves such impressions. A case built on impressions where admittedly there is and can be differences of opinion would seem to be one where the Administrator should want to hear both sides before taking the drastic action taken against my clients.

The so-called "finding of fact" by Dr. Butz upon which you based your conclusion or decision of "probable cause" is not a finding of fact at all but a statement that "the consensus of informed medical opinion is" that a product containing certain listed contents "would not be effective in preventing or treating most common diseases". You will search in vain in my client's booklet "How to Get Well and Stay Well" for any such claim that Nutrilite is effective in preventing or treating most common diseases. Since you merely claim that the labelling is *misleading* and Dr. Butz has not found facts directly applicable to the labelling of Nutrilite on the question of whether it is misleading, the denial to Mytinger and Casselberry of an opportunity to give you a correct statement of the facts makes your decision not only erroneous but arbitrary in the extreme. We do not know and could not guess just what Dr. Butz and your attorneys told you in the secret ex parte Conference which we presume you held before making the decision you made herein, but we respectfully say that if you had heard both sides you would not have made the decision you signed.

I would greatly appreciate your calling my letter of January 28, 1949, your response thereto dated February 11, 1949, and this letter to the attention of Mr. Ewing personally, if he has now recovered from his illness. As a lawyer he will certainly agree that a decision

condemning the labelling of Nutrilite as "misleading," when made in a "star chamber" proceedings, is repugnant to every legal principle under our Constitution. The Court of Appeals has just said in a decision cited by us in the injunction case, "He who decides anything, one party being unheard, though he should decide right, does wrong."

2165 You of course realize that the consequences of your decision of probable cause, made without a hearing, is that Mytinger and Casselberry will be put out of business completely or irreparably damaged by the multiple seizures threatened by Food and Drug officials, prior to any possible opportunity they might have to defend themselves against your erroneous claim that the labelling of Nutrilite is *misleading*.

On behalf of Mytinger and Casselberry, I again most respectfully request that the Administrator grant a hearing to Mytinger and Casselberry at which they will have an opportunity to present to him the full and true facts showing that the labelling of Nutrilite is not misleading in any respect.

Very respectfully yours,

CHARLES S. RHYNE.

2166 DEFENDANT'S EXHIBIT 11

Mytinger & Casselberry, Long Beach, Calif. (AF 28-002).

Nutrilite Products, Inc., Los Angeles, Calif. (AF 22-872).

March 2, 1949.

Dear Mr. Rhyne:

I have your letter of February 18, 1949, written on behalf of Mytinger & Casselberry, Inc., to renew the request that your client be granted a hearing at which it might present facts intended to show that the labeling of the product "Nutrilite" is not in any respect misleading.

This being your request, I do not see that the distinction made between "finding of fact" and "determination of probable cause" in Section 304(a)(2) of the Federal Food, Drug, and Cosmetic Act is of significance. The section is interpreted by this Agency, in accordance with its clear terms, to provide that the facts shall be found without hearing by any Agency officer or employee, and that the Administrator or one of his delegatees shall make the determination of probable cause upon the basis of the facts so found. You quite

obviously wish a hearing on the facts, regardless of your assertion that you wish to be heard on the determination of probable cause. We believe that the procedures that have been followed accord with the provisions of the law, and we find no basis for giving special treatment to your client.

My letter of February 11 was not intended to convey the thought that we considered the hearing in Los Angeles a basis for the findings of fact or the determination of probable cause. You are well aware that we believe that no hearing is contemplated prior to multiple seizures. We pointed out, however, that previously a hearing had been held which afforded Mytinger & Casselberry an opportunity to present their views in support of the truthfulness of the booklet "How to Get Well and Stay Well". The record of the hearing is before this Agency. Despite Mr. Myers' representation that the booklet would be revised to eliminate all drug claims and to offer the product as a special dietary food, the current editions of the booklet make substantially the same objectionable claims of therapeutic worth.

Dr. Dunbar's affidavit, which has been filed in the injunction case, contains a short analysis of the labeling, and I agree with his evaluation of it. I am advised that it is for the trier of the facts finally to say what representations have been made for a product and whether the representations are either false or misleading in any particular. We are content to leave it to the Court or jury that may try the cases to say whether our understanding of the labeling claims is a proper one.

2167 We see no reason to argue as to which of the several bases for multiple seizures is the weakest. Suffice it to say that Congress inserted all four conditions after considerable deliberation and study. According to our understanding, "consensus of medical opinion" is a provable fact and one of the briefs filed on my behalf in the injunction case documents that point.

The procedure which you characterize as "star chamber" is one which Congress evolved to satisfy the legitimate rights of both the consuming public and persons who deal in drugs. The statutory requirements have been followed carefully, and I am advised that they are not repugnant to the Constitution of the you quote, *WJR* v. *Federal Communications Commission*. They have discussed it in the brief referred to above.

Finally, I must disagree with your claim that the consequences of my determination of probable cause will irreparably damage your client before it has an opportunity to defend. Congress, in an effort to minimize the inconvenience to shippers in your client's position, provided a means for bringing the several actions together for trial in a single jurisdiction. You have not yet availed yourself of that right. The inconvenience of having actions pending in sev-

eral jurisdictions and the delays incident thereto are not entirely of our doing.

I do not find a basis for acceding to your request.

Sincerely yours,

(S.) J. DONALD KINGSLEY,
Acting Administrator.

Nutrilite Food Supplement

Finding of Fact

It is the consensus of informed medical opinion that most common diseases do not result from dietary deficiencies and that a product consisting of alfalfa, parsley, and water cress fortified with crystal-

line vitamins and vitamin concentrates which provides in the suggested daily intake the following:

Vitamin A, 25,000 U.S.P. units.
Vitamin B_1, 20 milligrams.
Vitamin B_2, 10 milligrams.
Vitamin C, 200 milligrams.
Vitamin D, 2500 U.S.P. units.
Vitamin B_6, 4 milligrams.
Vitamin E, 10 milligrams.
Vitamin K, 0.4 milligram.
Inositol, 20 milligrams.
Para-aminobenzoic acid, 20 milligrams.

together with a product consisting of bone meal, dicalcium phosphate, iron ammonium citrate, potassium iodide, niacin amide, and pantothenic acid which provides in the suggested daily intake the following:

Calcium, 950 milligrams.
Phosphorus, 562 milligrams.
Iron, 10 milligrams.
Iodine, 0.4 milligram.
Niacin amide, 15 milligrams.
Pantothenic acid, 8 milligrams.

would not be effective in preventing or treating most common diseases.

(S.) ROBERT C. BUTZ,

Robert C. Butz, M. D., Medical Officer Food and Drug Administration.

December 9, 1948.

2169 *Conclusion*

Pursuant to the provisions of the Federal Food, Drug and Cosmetic Act and regulations promulgated thereunder, I conclude on the basis of the facts reported above by Dr. Robert C. Butz, an employee of the Food and Drug Administration of the Federal Security Agency, that there is probable cause for me to believe and I do believe, that the labeling of this article would be and is in a material respect misleading to the injury or damage of the purchaser or consumer.

9-113-K
Nutrilite Food Supplement

FINDING OF FACT

It is the consensus of informed medical opinion that a product consisting of extracts of alfalfa, parsley, and water cress fortified with crystalline vitamins and vitamin concentrates which provides in the daily intake the following:

Vitamin A, 25,000 U.S.P. units.
Vitamin B_1, 20 milligrams.
Vitamin B_2 10 milligrams.
Vitamin C, 200 milligrams.
Vitamin D, 2500 U.S.P. units.
Vitamin E, 10 milligrams.

Vitamin K, 0.4 milligram.
Vitamin B_6, 4 milligrams.
Inositol, 20 milligrams.
Para-aminobenzoic acid, 20 milligrams;

together with a product consisting of bone meal, dicalcium phosphate, iron ammonium citrate, potassium iodide, niacin amide, and pantothenic acid which provides in the suggested daily intake the following:

Calcium 950 milligrams.
Phosphorus, 562 milligrams.
Iron, 10 milligrams.
Iodine, 0.4 milligram.
Niacin amide, 15 milligrams.
Pantothenic acid, 8 milligrams;

would not be effective in the treatment of low vitality, over-fatigue, insomnia, poor appetite, gastro-intestinal distress, recurrent vague aches and pains, weak eyes, defective teeth, nervousness, heart disease, stomach pains, disease conditions requiring surgery, feeble mindedness, diabetes, hemorrhage connected with the menopause, indigestion, sneezing, weeping, anemia, leukemia, sinus trouble, constipation, tuberculosis, headache, dizziness, vomiting, and all deficiency diseases.

C., beginning at 2:00 p.m., before August Wolff, a Notary Public in and for the District of Columbia, when were present on behalf of the respective parties:

Charles S. Rhyne, Esq., for the Plaintiff.
Vincent A. Kleinfeld, Esq., and William W. Goodrich, Esq., for the defendants.

2175 PROCEEDINGS

Thereupon, DR. ROBERT C. BUTZ was called for examination by counsel for plaintiff and, having been first duly sworn by the notary, was examined and testified as follows:

Examination by counsel for plaintiff:

By Mr. Rhyne:

Q. Will you give your full name and address to the reporter?
A. Robert C. Butz, 9107 Eton, E-t-o-n Road, Silver Spring, Maryland.
Q. Doctor, how long have you been employed with the Food and Drug Administration?
A. About two and a half years.
Q. What degrees do you have, and from what schools?
A. BS from the University of Wisconsin; MD from the University of Illinois.
Q. When did you obtain your MD Degree?
A. March, '43.

Q. What did you do between 1943 and the time you came with the Food and Drug Administration?

A. I interned with the United States Marine Hospital in
2176 San Francisco, and spent three years in the Army.

Q. What type of work did you do in the Army, Doctor?

A. I was general medical officer part of the time, and I was assigned to neuropsychiatry a great deal of the time, which includes general medicine.

Q. Did you do any work that involved research in the field of nutrition before you came to the Government?

A. Yes. I was a research assistant for Dr. E. L. Sevringhaus, and Dr. E. S. Gordon, University of Wisconsin.

Q. For how long and what years?

A. I think that was '37 to '39.

Q. That was before you received your MD?

A. That is true.

Q. While you were a student at the university?

A. Yes.

Q. Have you made any special studies in nutrition since your graduation?

A. No. Other than keeping up.

Q. What type of work have you performed with the Food and Drug Administration?

A. Well, almost anything that you are called upon to do and pass medical opinion upon in the enforcement of the Food, Drug and Cosmetic Act.

2177 Q. Do you recall that you made certain findings of fact with respect to Nutrilite?

A. Well, I didn't recall it until I was notified that I was going to make a deposition. In fact, I had forgotten it. Nutrilite was just one of the numerous things that go through the office. I mean, it wasn't anything.

Q. But now that it has been called to your attention, you do recall that you made such findings?

A. I remember looking over that literature.

Q. Do you have copies of the findings of fact that you have signed?

A. Well, this (indicating) is not signed, but——

Q. That you prepared, then?

A. Yes.

Q. You did sign them, didn't you, Doctor?

A. Yes. This carbon (indicating) isn't signed; that is all. These are my findings of fact.

Q. Do you have before you the papers entitled "Finding of Fact," dated September 30, 1948?

A. No. I have December 2, 1948.

Mr. GOODRICH: Let me get these straight because these are my copies. You have all three of them here.

By Mr. Rhyne:

2178 Q. You now have before you this finding of fact dated September 30, 1948?

A. I do.

Q. What do you mean by the term "concensus of informed medical opinion"?

A. "Concensus of informed medical opinion" is that crystallized opinion that a doctor gets as a result of his training and study through his contact as he continues in his work as a physician.

Q. With particular respect to Nutrilite and the vitamins and minerals that it contains, did you form your opinion as to what the concensus of informed medical opinion is from reading the scientific literature in the field?

A. Not the scientific literature. In your contact with men, you would talk with them, go to staff conferences, and you hear what they think about the various things that are being used today, and what they feel their value is, along with reading the scientific literature. I couldn't quote you any passage and paragraph for it.

Q. Are you familiar with the scientific literature in this field?

A. Fairly well.

2179 Q. Who would you say is the outstanding M. D. in the field of nutrition?

A. Well, Dr. Thomas Spies is probably as well known as any of them. He is more publicized. Many men who are prolific writers are not always considered by someone else to be the best authorities in the field.

Q. Do you consider him to be a real authority?

A. I consider him to be a very fine physician.

Q. And well qualified to write on the subject of vitamins and minerals?

A. Yes.

Q. Would you name any other M. D. who you consider to be qualified in this field?

A. Dr. Sturgis, the University of Michigan.

Q. Do you know his first name?

A. I don't recall it right now.

Q. Do you know Dr. Russell M. Wilder?

A. I know him by name.

Q. Do you consider him to be qualified?

A. I think that he would be considered.

Q. Have you read any of the things that he has written on vitamins and minerals?

A. I probably have, but I don't recognize them as being

Dr. Wilder's particular work. I wouldn't say that I would
2180 know what he has said distinctly from anybody else.

Q. Have you read any of the writings of Dr. Spies?

A. I believe so.

Q. Have you heard of Henry Clapp Sherman?

A. Dr. Sherman is one of the early men who made determinations for standards in the vitamin field.

Q. Are you acquainted with any of his writings in this field?

A. Not distinctly, not as a separate entity I wouldn't say that I know what his standards are. You know, as distinct from somebody else's.

Q. Have you heard of Barnett Sure?

A. No, I don't know the name.

Q. How about Dr. Hugh R. Butt?

A. No relative. I don't know him.

Q. I believe he spells his name a little different than you.

A. Yes.

Q. Have you heard of Lela Booher?

A. Yes, I have heard of the name. I don't know her.

Q. Have you heard of Gilbert Dalldorf?

A. No.

Q. Have you heard of Dr. J. H. Musser?

2181 A. University of Wisconsin, I believe, originally.

Q. I have Tulane School of Medicine.

And Julia Outhouse Holmes, Massachusetts State College, have you heard of her?

A. I think she is in home economics, a nutritionist, but I don't know her personally.

Q. And Dr. Daniel T. Quigley?

A. I don't know him.

Q. In the field of diabetes, have you heard of Dr. Joseph H. Barach?

A. I know the name.

Q. And in arthritis——

A. (interposing) I believe he is a New York man.

Q. Yes.

In the field of arthritis, Dr. Theodore F. Bach?

A. No, I don't recall him.

Q. How many patients have you examined to determine whether or not they have vitamin and mineral deficiencies?

A. I suppose several thousand.

Q. Several thousand?

A. I mean, when you say "vitamin and mineral deficiencies," you examine every patient looking for any possibility of anything

that he might have. Any patient that you look at you con-
2182 sider any possibility of any type of disease he might have, so I didn't screen them purposely for the purpose of vitamin deficiencies, which is quite rare.

Q. Where did you make these several thousand examinations, Doctor?

A. The University of Illinois, during the time I was a student, Cook County Hospital, Presbyterian Hospital, research and education hospitals, internship and Army.

Q. Have you made any examinations since you completed your internship?

A. During the three years I was in the Army I probably had to do about five a day, I would say I averaged.

Q. Do you think that a physical examination of a patient will indicate with assurance to a doctor whether a deficiency disease exists?

A. If you limit it to physical, manual techniques, no, but any physical examination also includes a mental status of the individual, your evaluation of him as an individual.

Q. Is it true that the cause of a particular deficiency disease can be strictly nutritional or functional and that the symptoms may often be the same?

A. How did you put that now?

Mr. RHYNE (to the notary-reporter): Will you read him
2183 the question?

(The pending question was read by the notary-reporter.)

Mr. GOODRICH: I object to the question on the ground that it is too broad and too vague and that it is impossible to answer.

Mr. RHYNE: There is no use suggesting that it is impossible to answer.

Mr. GOODRICH (to the witness): It is too broad a question.

Mr. KLEINFELD: Go ahead and answer it, if you can.

THE WITNESS: When you put the term "functional" in there you make it anything that might have to do with the outlook of the patient, along with what he might physically be deficient in, so you couldn't say that a thing is functional due to a vitamin deficiency. You could have got a better answer if you would have limited it to vitamins.

By Mr. Rhyne:

Q. Suppose I limit it to vitamins, what answer do I get?

A. There are conditions that are due to vitamin deficiencies, but they are quite rare.

Q. Have you discussed the contents of Nutrilite with any other doctors within the Food and Drug Administration?

A. Yes.

Q. Who?

2184 A. Dr. Camel, Dr. Weinstein, Dr. Granger, Dr. Nelson.

Mr. GOODRICH: Specify which Nelson.

THE WITNESS: E. E.

I did not discuss these things with them as Nutrilite. We talked them over in terms: "What will certain vitamins do in certain conditions?" I didn't say, "Do you think Nutrilite will do this?"

By Mr. Rhyne:

Q. You just informed them of the contents of Nutrilite?

A. Not specifically labeling the exact formula, but "Would a compound having certain of these that are considered of value treat any of these conditions?"

Q. Did they all agree with you that the vitamins and minerals in Nutrilite would not help low vitality?

A. I will have to answer that this way: Low vitality is a symptom. It is the way you feel. In a recent study, that I think was done in Boston, it was found that not over one to two percent of all the people who thought they had general low vitality and over-fatigue, feeling generally lousy, you might say, who felt their conditions might be improved by vitamins—this is a study done—98 percent is probably psychic, 2 percent is probably due to real deficiencies of some type, marginal.

2185 Q. Who made the study, Doctor?

A. I can't recall that name for you. I would have given it to you.

Q. When you say "recent," what do you mean by that?

A. It is about a year and a half ago, as I remember.

Q. Do you recall when and where you saw it?

A. No. It just came up in my mind.

Q. Right now or before you made this finding?

A. When I was asked about this the other day I tried to re-find the article. I couldn't find it.

Q. Was that an article that you read before you made this finding of fact?

A. Yes.

Q. And based solely on that article, you concluded that vitamins and minerals wouldn't help a person with low vitality?

A. No, I don't think so.

Q. What did you conclude?

A. That was one of the things I read which gave a general statistical indication of about where these things lie. I offer that only as a general indication of feeling in the field about the value of vitamins in the treatment of complaints of the human race.

Q. And you concluded that this figure of 98 percent was
2186 about correct?

A. In my experience that has been correct. I have seen a good many of these people that came from Japan, during the latter part of my stay in the Army, and it so happened that a few of them were actually nutritionally deficiency. I saw that most of the ones who came into my particular section, the causes were emotional disturbances, and if we had been able to cure them with vitamins we gave them all they could stand.

Q. So you agree with the idea that vitamins would not help people suffering from low vitality in 98 percent of the cases?

A. I would say that 98 percent, approximately, of the people get no benefits other than psychic for themselves in 98 percent of the cases.

Q. Is it your conclusion, Doctor, that vitamins and minerals are, in fact, worthless?

A. No. They have an adjunct use.

Q. What do you mean by "adjunct use"?

A. If you, for instance, are a little nervous right now, and I am a little jumpy because we are working something out here, vitamins and minerals won't do a thing for us.

Q. That still doesn't tell me what you mean by "adjunct use," Doctor.

2187 A. All right. If, for instance, you were a diabetic and you had a little higher requirement for vitamins than the ordinary individual, they would be an adjunct to your specific treatment for diabetes.

Q. They would help, then, in the treatment of diabetes?

A. We would give them to be certain the individual gets a sufficient amount, and we evaluate that person as he goes along, and we watch him.

Q. Now, when you had this discussion with the other doctors inside the Food and Drug Administration, just what was the nature of the discussion? What was the occasion for it?

A. Oh, vitamins are a thing that come over the desk quite often. So you ask, "Well, have you heard of this? What do you think of that? What is the feeling? What have you learned from the people that you have come in contact with? What is the general status today of this new attitude toward some certain vitamin?"

Q. In other words, you were trying to find out what their conclusions were?

A. In view of my own experience, I would evaluate their answers.

Q. Was this a conference to discuss Nutrilite or to discuss vitamins and minerals in general?

2188 A. Vitamins and minerals in general. It wasn't a conference as such; it was merely, you go in to see a friend of yours about some problem you have.

Q. So it had not really any relation to the specific contents of Nutrilite?

A. Not to the specific and unique contents of this particular preparation.

Q. When you refer to the "unique" contents of the preparation, what do you mean, Doctor?

A. I mean there is probably no other preparation on the market that has exactly the same contents as this one does that I know of.

Q. Do you refer to the extracts from alfalfa, parsley, and watercress?

A. Not just those. Years ago I inherited about four cartons of cerophyll. Do you remember that particular vitamin preparation?

Q. No.

A. I think it was made in Iowa, or some place.

Q. Well, now, Doctor, did you discuss Nutrilite with anyone outside of the Food and Drug Administration?

A. No.

Q. How did it happen to come to your attention?

2189 A. Normal processes of things coming across the desk.

Q. Do you recall when it came to your attention?

A. No. When I was trying to think of it, I thought sometime within the last six months. When I received notice of this deposition, I tried to think of when had I done this.

Q. Now, you prepared three different findings of fact, did you not?

A. Yes.

Q. Can you tell me why you did?

A. In the process of law they require these at different times; and as a medical officer I was required to evaluate them at those different times. For what specific legal reasons they were drawn up at that time, I don't know.

Q. I am merely asking you as to factual reasons, if you know. Each one of your findings is different, is it not?

A. Well, I don't remember that it is materially different.

Q. What I am getting at, how did you go about preparing them? Say the one on September 30, 1948. And then you had the request for the one on December 2, 1948. Why is it different?

A. Probably because I didn't remember the exact wording from the time before.

2190 Q. You didn't refer back to your file?

A. I don't keep a file. I read over probably the one that I had done September 7, I looked at it, and included that in the

total file that came to me from the other division when it was referred to me. I don't have any personal file on Nutrilite, of course.

Q. Well, now, in your opinion of September 30, you list a number of ailments which you say that Nutrilite would not be effective in the treatment of. Where did you get that list?

A. I think that was probably in the Nutrilite book, as I remember.

Q. You read the Nutrilite book and gleaned these out of there?

A. I believe I read through the Nutrilite book, and I think there was also an excerpt prepared from the Nutrilite book.

Q. And you don't know whether you relied upon the excerpt or the book?

A. I would say I read the book through looking for medically significant passages in it. That is probably where I picked up these particular references to things that pertain to the field of medicine.

Q. You say probably. Could it be possible that you took
2191 these off the excerpts?

A. It could be possible.

Q. At the time you read the booklet, do you recall that you specifically found these ailments mentioned in it?

A. I think so.

Do you happen to have a book?

Q. I do have.

(The book referred to was handed to the witness.)

THE WITNESS: I think you probably would have a better marked one than I for saving time.

Mr. GOODRICH: He will have to have all three of the books.

THE WITNESS: Are all these conditions mentioned in the book?

Mr. RHYNE: We don't find that they are.

THE WITNESS: You don't find that they are?

Well, in order to save looking for each specific item in there, that is, what you want me to name—the one you have in question is this finding of fact of September 30?

Mr. RHYNE: Yes.

THE WITNESS: You would like me to find——

By Mr. Rhyne:

Q. For example, where does it say in there that Nutrilite is effective for the treatment of constipation?

2192 Mr. GOODRICH: Let's get the book. I object to that unless the 58-page book is placed before the witness.

Mr. RHYNE: Do you have the 58-page book?

Mr. GOODRICH: I don't have it up here. If you don't have it——

Mr. RHYNE: I don't have it, I am sorry.

Mr. GOODRICH: I probably could get it up here.

Mr. RHYNE: I will ask some questions about something else until we get the 58-page book.

THE WITNESS: The thing is, I am quite certain that all these statements are made in your book.

By Mr. Rhyne:

Q. You are quite certain that——

A. (interposing) I am saying this to save you time, I mean.

Q. I am not interested in saving time, Doctor. I am trying to get the true facts in this case.

A. I don't think we would go to the trouble of putting all those in unless we found them in there.

Mr. KLEINFELD: I want to object to this line of questioning on the ground that it is really irrelevant to the issue in this case. Dr. Butz has made findings of fact as to what a product bearing the
2193 ingredients contained in Nutrilite do in the treatment and cure of various diseases. What his opinion is on the labeling, or what it says, is irrelevant and not germane to the issue involved in this case.

Mr. RHYNE: He is not being asked his opinion of the labeling; he is being asked where he found specific things in the label.

I will ask different questions until the 58-page book gets here.

By Mr. Rhyne:

Q. Doctor, in arriving at this matter you refer to as "concensus of informed medical opinion," did you base that upon any specific writing other than this study you say originated in Boston which you can't identify now?

A. I made it as a result of all the reading and training I have had, not as a result of any specific one.

Q. Can you give me the name of any particular thing that you have read about vitamins or minerals upon which you relied?

A. No.

Q. Can you recall anything other than this Boston study that you have ever read on the subject of vitamins and minerals?

A. Would you like a recitation of detailed information on vitamins that I have read in general or—

2194 Q. Yes. Yes.

A. Well, for instance, the concensus of medical opinion today is that Vitamin E, which you have in here, is not considered useful in human nutrition at the present time. Vitamin B-6 isn't considered useful,——

Q. No, Doctor, you said you could name the detailed writings. That is what I asked for.

A. No, no. I thought what you wanted was something different.

Q. You cannot name anything in particular that you read?

A. Nothing specifically that I could select as being the authority upon which I would base an opinion.

Q. Are you familiar with the publication, "New and Known Official Remedies"?

A. I know of it.

Q. Is it authoritative on such things as vitamins and minerals?

A. It represents the official position.

Q. Does it represent the concensus of medical opinion?

A. At the time it was written, yes.

Q. In other words, a 1948 edition of that particular volume would give what you refer to as the "concensus of medical opinion" for that year?

2195 A. I believe that is the feeling about it.

Q. And the 1947 would give it for that year, and the 1949 would give it for this year?

A. Yes.

Q. So that if someone referred to that volume, why, they would, in fact, be reading the concensus of informed medical opinion on vitamins and minerals?

A. Up to the time it was published probably. For instance, if something had changed completely since it was published, or the general feeling among the group of men who were responsible for publishing it, if there was a change to be made, of course it would change.

Q. Doctor, do you think that nerve functions, stability, depend upon a proper proportion of vitamins and minerals in the diet of each person?

A. I think that is a pretty fair statement; yes.

Q. Do you think that physical and mental fitness depend in part on the proportion of mineral and vitamins in the diet?

A. I do.

Q. You are not a biochemist?

A. No.

Q. Or a nutritionist?

A. No.

2196 Q. Have you ever heard of the National Research Council?

A. Yes, sir.

Q. Would bulletins published by that Council be considered authoritative?

A. I think that you could consider then the concensus among the nutritionists of that time.

Q. They are a publication that you could safely rely upon, then, in the field?

A. Usually, yes.

Q. I hand you a bulletin entitled "Inadequate Diets and Nutritional Deficiencies in the United States," being a bulletin of the National Research Council, No. 109, and ask you if you have had that called to your attention?

Mr. GOODRICH: I object to his line of questioning on the ground that it is an attempt, in the examination of this witness, to place in the record hearsay statements in a publication which the witness has not stated he relied upon in forming his opinion. For that reason it is not proper examination.

Go ahead.

Mr. RHYNE: The only question I am asking him so far is if he ever saw it or heard of it.

Mr. GOODRICH: I object to any examination on the booklet as an attempt to place in the record hearsay statements on
2197 which this witness has not relied.

By Mr. Rhyne:

Q. Doctor, would you place more or less reliance upon the publication of the National Research Council than this publication that you rely so greatly on that came out of Boston?

A. I think you are deliberately attempting to mislead me in your statement there.

I would say that the National Research Council finding is, in general, considered the concensus of opinion.

Q. What about this Boston statement?

A. I think that represents a general attitude by a particular group of people.

Q. Who were the group?

A. As I say, I don't remember that particular thing. I would like to furnish it to you so you could question me on it. That is what you would like?

Q. I would be very happy to have you furnish it to me.

A. Unfortunately, I can't find it.

Q. You say you have never seen this (indicating)?

A. I won't say I have never seen it. I don't remember what is in it. I won't say that it wasn't up to the minute at that time; probably it was quite good at that time.

Q. You recognize that there is such a thing as deficiency
2198 diseases, Doctor?

A. Yes.

Q. Do you recognize that these diseases come from a nutritional deficiency?

A. Yes.

Q. If I were to tell you that this 1943 bulletin comes to the general conclusion that nutritional deficiencies exist on a wide-

spread scale in the United States, would you consider that conclusion authoritative as of that time?

A. I think that is a matter of degree at that time.

Q. For example, it says here: "All the data from numerous surveys with new methods among persons of all ages in many regions are entirely in accord in showing that deficiency states are rife throughout the nation."

Mr. GOODRICH: I object on the ground that it is an attempt to put in a hearsay statement from a publication over which this witness has not relied. I object for the further reason that if examination is to be conducted on this booklet, the witness should be permitted to examine the entire booklet rather than be asked questions at random selected by counsel.

Mr. RHYNE: Are you finished?

Mr. GOODRICH: Yes.

2199 Mr. RHYNE (reading): "Relatively few are the traditional severe, acute types. Most are milder in intensity and gradual in their course. Predominantly they are subacute or chronic states: Some marked, but very many mild or moderate."

THE WITNESS: You want me to agree with that?

Mr. RHYNE: Yes, if you will.

THE WITNESS: I will agree with that.

Mr. GOODRICH: Same objection to that.

By Mr. Rhyne:

Q. Doctor, do you believe that foods should be evaluated on the basis of what they contain rather than what they look like?

A. I think so.

Q. Do you know that deficiencies are caused in part by eating foods deficient in vitamins and minerals?

A. I think that is true.

Q. Is it possible that the diet of many people contains an inadequate supply of vitamins and minerals because they do not eat the right food, rather than because they do not eat enough food?

Mr. KLEINFELD: I object on the ground that the Doctor has not qualified as a nutritional expert.

2200 Mr. RHYNE: Read him the question (to the notary-reporter).

(The pending question was read by the notary-reporter.)

THE WITNESS: For those people who are nutritionally deficient, yes.

By Mr. Rhyne:

Q. Doctor, is it true that many people do not develop acute symptoms of disease but nevertheless fail to secure the full amount of vitamins and minerals consistent with ideal physical well-being?

A. I think it is true that the standards which have been set up as being ideal are not met by a certain proportion of the population. I couldn't state what proportion that is.

Q. This is what they call a subacute or mild deficiency state, is it, in the literature?

A. If there is detectable at all and isn't sufficient to hospitalize them, they call it mild, I would say. That would be general.

Q. What is your understanding of the word "chronic", Doctor?

A. "Chronic" is a condition that exists for a period of time in contrast with acute. You could have a chronic condition which would flare up and be acute. But "chronic" usually implies that it
2201 exists over a longer period of time than is ordinarily found in diseases. For instance, if you have a cold that lasts a week, that is acute. If it lasts a period of months it would be chronic.

Q. Doctor, is it true that mineral and vitamin deficiency conditions can be effectively corrected by administration of various vitamin and minerals in concentrated forms—for example, taking Nutrilite?

A. If Nutrilite contained the specific vitamins in the concentration which you wanted for the individual at that time.

Q. Do you think that self-medication is wrong?

A. No.

Q. Do you think that every person should attempt to secure an adequate supply of vitamins and minerals in his daily diet?

A. I do.

Q. Can he do this without consulting an M. D.?

A. Sure.

Q. Can he do this by taking vitamins and minerals in concentrated form, as by taking Nutrilite?

A. His ordinary diet should contain all the vitamins and minerals he needs.

Q. But if he has a deficiency condition——

2202 A. Then he should—he would first have to know that he had deficiency condition. In order to know it, he would have to be conversant with the clinical symptoms or the chemical study showing that he was deficient in that particular thing.

Q. Well, now, Doctor, can you tell me—you speak of clinical symptoms—can you tell me how you would go about testing a particular person to determine whether or not he had a deficiency of Vitamin A?

A. Well, the one that we use in most hospitals, there is a biophotometric method. It is dependent upon the greater regeneration of visual purple. Light bleaches it.

You don't want a long-winded talk on this?

Q. I want you to give any explanation that you want to give, Doctor.

A. Visual purple is a protein complex that contains Vitamin A as part of it. If this is bleached by light and does not regenerate rapidly enough because of a deficiency of Vitamin A, the individual is considered to have a condition called night blindness, or Nyctalopia.

Q. How many doctors have the necessary equipment to give such a test?

A. Not very many.

2203 Q. That is an unusual test, is it not?

A. No. I mean, I had it run on me when I was in school.

Q. I mean, it is not the kind of a test an ordinary M. D. can give you because he doesn't have the equipment, isn't that true?

A. You go by clinical symptoms ordinarily, appearance.

Q. Even with this equipment, can you examine a patient in a subacute stage and be sure of your diagnosis?

A. Usually there is a progressive change with the degree of Vitamin A deficiency.

Q. That is a rather expensive test, is it not?

A. No.

For instance, there are time standards on those that give you a general indication. You don't have to run a long series of studies on any one particular individual. There are limits beyond which the greater regeneration is such where you would say that the person is marginally deficient and the amount of deficiency is more or less proportional.

Q. How would you go about testing a patient——

A. (interposing) You can also do a blood determination of Vitamin A. It isn't ordinarily done. It is in research. It isn't done clinically, I mean, on the ordinary individual, except in the

2204 hospitals where they want specific blood studies done.

Q. From what you have said, Doctor, isn't it true in order to make the test; the way you have described it, you would of necessity have to go to a hospital or clinic to have it made rather than an ordinary M. D.'s office?

A. Yes, that is true.

Q. How would you test a patient for a deficiency of Vitamin B-2?

A. B-2, riboflavin. People show such symptoms as perleche, glossitis, vascularization of the cornea.

Q. Doctor, the symptoms you are mentioning are acute rather than subacute symptoms, are they not?

A. Yes. With a slit lamp microscope, for instance, on the eye, you can determine early vascularization because there is corneal opacities.

Q. Do you have anything else to say on how you would test a patient for deficiency of Vitamin B-2?

A. No.

Q. How about niacin?

A. Niacin is in its acute condition—niacin deficiency is known as pellagra.

Q. Is known as what?

A. Pellagra.

2205 Q. Well, in the subacute stage, how would you go about testing to determine whether a person had a niacin deficiency?

A. You notice the skin changes. They have a change in pigmentation.

Q. In other words, you would do it visually?

A. Usually. That is usually the best way, the easiest way.

Q. Doctor, do most M. D.'s have this particular kind of lamp that you referred to in discussing Vitamin B-2?

A. You mean a slit lamp microscope?

Q. Yes.

A. Just ophthalmologists usually.

Q. So if you went to an ordinary M. D., you couldn't have that kind of a test made?

A. Not that kind of a test.

Q. How would an ordinary M. D. test for deficiency of B-2?

A. By appearance.

Q. Is that an accurate test?

A. Along with the history and physical, it is.

I think I should qualify any of these statements that I made, that an examination of a patient you want to know all about his

2206 history, all the things about him, not just what he complains of. You want the complete history of the individual's life because you get a great many leads there, plus your special laboratory findings.

Q. How would you test for a deficiency of Vitamin D, Doctor?

A. Vitamin D is a deficiency that I don't think I have ever seen —very rarely in this country—except in children or certain conditions in which the individual has some difficulty with absorption of Vitamin D. Since Vitamin D is a fat soluble vitamin, you usually store it over a long period of time. The amount of time that it would take a Vitamin D deficiency, should the other symptoms which had brought on the deficiency because of defective absorption or neutralization, would give him time to get to a physician to determine what the cause of getting deficient would be.

Q. But still my question is, how would you test?

A. You can take X-rays. X-rays would show decalcification of the epiphysis.

Q. Is that an accurate test?

A. To a radiologist who can read them accurately it is accurate. To the person who would take an X-ray, who would ordinarily be able to read it. There are other conditions, of course, that
2207 give similar appearances on X-ray to the type of X-ray finding you have.

Q. That is not a test an ordinary M. D. can make?

A. The ordinary M. D. wouldn't ordinarily have to take it. Rickets, I think, isn't ordinarily considered today in anything except children. I don't believe that Nutrilite is directed at children Is it? Infants?

Q. Did you find anything in the——

A. (interposing) To say it wasn't? No.

Q. How about pantothenic acid?

A. Pantothenic acid isn't considered to have any human use in nutrition at the present time.

Q. When we started out here we were talking about tests. Do you know of any tests whereby a person can be tested for pantothenic acid?

A. I don't know any.

Q. How about calcium?

A. Calcium? Take blood calcium determination; they usually run about 9 to 11 milligrams percent.

Q. Isn't it true that the blood levels of calcium may remain practically normal even in pronounced cases of rickets?

A. We are presupposing that we know that it is rickets due to D deficiency. Is that what you are getting at?

Q. Yes.

2208 A. When a person shows those symptoms, you don't always know it is the D deficiency. He might have a parathyroid condition.

Q. Do you think this blood level is an accurate test, then?

A. It is an accurate test for calcium.

Q. How about a deficiency in iron?

A. The ordinary individual in his diet gets sufficient iron. What do you want out of that?

Q. Just tell me how you would test a person for a deficiency in iron.

A. I would take the hemoglobin.

Q. How about iodine?

A. There is a blood test for iodine. I think you use a colorimeter for it, in fact. It is a color test.

Q. And you think that is an accurate test, do you?

A. Oh, yes. It is accurate within limits of the test. I mean, it is as accurate as we have.

Q. How about Vitamin B-1, how would you test for deficiencies in Vitamin B-1?

A. Vitamin B-1 deficiency is a clinical evaluation as characterized by the symptoms of beri-beri.

Q. How would you determine deficiency in B-1?

2209 A. You mean what are the symptoms?

Q. Yes.

A. B-1 deficiency?

Well, in the subclinical area, which I try to avoid, sometimes in those people who are actually B-1 deficient they do have low vitality, over-fatigue, gastro-intestinal upsets, in the more severe conditions, inactivity, their estrogens giving symptoms of dismenorrhea.

Q. Could you tell us what that is in layman's language?

A. Trouble with your menstrual periods. That will do.

Q. Now, you have switched on me from tests to determine deficiencies to symptoms, Doctor.

A. There is a clinical test for thiamin—that is, a chemical test that can be done on the blood. It isn't ordinarily used except in research centers.

Q. Isn't it true that all of the tests that you have been telling us about here are tests that are ordinarily made in what we would say are research centers, clinics, or hospitals, rather than M. D.'s offices?

A. The ordinary M. D. goes by the clinical symptoms.

Q. I am asking you about the different kinds of tests that you have been talking about. There are tests that are made by ordinary M. D.'s.

2210 A. No, the ordinary M. D. doesn't do B complex determination, nor a determination in his office, that is true.

Q. Since you referred to Vitamin B-1 deficiency symptoms, wouldn't you also have a loss of appetite if you had it in a subacute stage?

A. That is usually one of the concurrent complaints.

Q. I believe you did refer to loss of strength and energy or low vitality.

A. Yes.

Q. Couldn't there also be a swelling of the lower extremities?

A. That is, usually. That edema is usually late.

Q. Doesn't the heart become enlarged in some instances?

A. In severe cases.

Q. How about breakdown of the nerve fibres?

A. Usually the function of nerve is dependent upon having adequate amounts.

Q. And you refer to stomach and intestinal upsets——
A. Yes.
Q. I suppose with all of that would come general irritability?
A. Yes. If we can assume those are only due to B-1.
Q. Yes. I mean those are some of the symptoms?
2211 A. Yes.
Q. While we are talking about symptoms, Doctor, what are some of the symptoms of an iodine deficiency?
A. Goitre.
Q. Isn't it also true that you have a dulling of the mental faculties? I take it you have had some experience in that field.
A. I have had very few cretins. People who are hypothyroid, in the rare cases where the hypothyroidism is just due to the iodine deficiency, do have some slowing up of their process of cerebration.
Q. And there is also a slowing up of the processes of growth, is there not?
A. Yes.
Q. By that I mean both physical and mental growth.
A. Yes.
Q. On Vitamin E deficiency, what are some of the symptoms?
A. Vitamin E isn't recognized to be a deficiency disease which humans have.
Q. Well, I noticed in the papers two or three days ago a report something like the one that you talked about up at Boston, which was just published in New York. That referred to Vitamin
2212 E in diabetes. It was a report by a man named Vogesang, a Canadian,——

Mr. KLEINFELD: Have you asked a question, Mr. Rhyne?
Mr. RHYNE: Yes.
Mr. KLEINFELD: Please read the question (to the notary-reporter).

(The pending question was read by the notary-reporter.)

By Mr. Rhyne:

Q. Have you heard of that report?
A. I think if you read further it said they had quite an argument about that, too, and it wasn't agreed to by everybody present, and that they tended to discredit his work.
The general feeling was of that meeting that Vitamin E has no present proved use. We have no deficiencies of E that are proven.
This particular man is a research man, I believe, and I think he offered to treat any number of people with Vitamin E. I don't think he just mentioned this for diabetes, but also heart condition, and so forth.
Q. I think he mentioned habitual abortion.
A. That is in rats. That is not in human vitamin E.

Q. Isn't it true that the Canadians have reported rather extensively with Vitamin E in humans on habitual abortion?

A. That is true. But it isn't agreed that Vitamin E is
2213 the cause. That particular man is sold on it; he is convinced of the value of it.

Q. Hasn't Vitamin E also been referred to in connection with certain types of heart conditions?

A. Yes. But as I say, Vitamin E is one of the things that humans have to a large extent in their tissues and which is essential for muscle function. But it isn't recognized that we have Vitamin E deficiency.

Q. Doctor, what about a calcium deficiency? What are some of the symptoms?

A. Well, one of the symptoms would be a tetany. Calcium deficiency would be tetany, muscle spasm.

Q. Would you also have bone deformities of various kinds?

A. That was the X-ray findings I referred to before. Both structural deformities of the bone and also shaped deformities of the bone. These are particularly noticeable at the epiphysis.

Q. Doesn't a calcium deficiency also show up in tooth decay?

A. After a tooth is formed I don't believe that Vitamin D—calcium, I don't believe has any effect on teeth. There is nothing shown.

Q. How about nervousness?

2214 A. Only in case that you had a calcium deficiency, which is rather rare as far as the diet is concerned.

Q. Neurotic pains, for example?

A. No. In neurotic pains, 90 percent of them are due to the psychic structure of the individual.

Q. Now, what are some of the symptoms of an iron deficiency?

A. Hypochromic anemia.

Q. Anemia?

A. Hypochromic anemia.

Q. What does the first word mean?

A. Low color.

Q. Paleness?

A. Paleness of the red cells.

Q. Would you also have lack of energy or listlessness with an iron deficiency?

A. If you weren't getting sufficient oxygen to your tissues because of the fact that you weren't getting enough oxygen carried by your blood because of the deficient formation of hemoglobin, which requires iron as a part of the porphyrin ring structure—you don't want this, do you?

Q. Sure I do. I sure do. It is very important. Don't you
2215 also have a numbness in your hands and feet when you have a deficiency of iron?

A. That sensation is due to the oxygen deficiency which is a secondary result of the iron deficiency.

Q. You would have restlessness, would you not?

A. As a psychic symptom.

Q. Again, a lack of energy?

A. If it is due to an iron deficiency, these symptoms——

Q. It could come from it?

A. It is possible; yes.

Q. What about the heart; would you sometimes have palpitation of the heart with an iron deficiency?

A. Again, you would have the palpitation secondarily due to the same physiology as before mentioned.

Q. How about sore tongue in mouth, does that ever come from iron deficiency?

A. The type of microcytic anemias are ordinarily not ducytic to the iron deficiency.

Q. In other words, you say that you don't have a sore tongue in the mouth from iron deficiency?

A. Ordinarily not.

Q. But you could have it?

A. Could have it.

Q. Now, how about niacin deficiency, what are some of
2216 the symptoms?

A. Niacin deficiency, it is again characterized by a sore tongue, smoothness, skin changes.

Q. Do you have also a depressive feeling or mental dullness?

A. It is believed that some of the early symptoms—the thing you are apparently trying to work out, and I can save you time——

Q. Yes:

A. Some of the early symptoms of niacin deficiencies are characterized by a dullness, almost the whole gamut of psychic symptomatology.

Q. And you referred to skin changes, did you not?

A. Yes.

Q. That can come from niacin deficiency?

A. It can.

Q. Now, take Vitamin D deficiency symptoms, what are they?

A. In the child you come to tetanies, poor bone development, and structural development of the bone, defective shape of bones.

Q. That is like enlargements of the wrists and ankles and bones?

2217 A. Parietal bosses.

Q. What do you mean by that?

A. Knobbing on the head. They get square heads.

Q. That comes from Vitamin D deficiency?

A. It is possible. They are rare and unusual. You hear them only in text book anomalies.

Q. Does it have an effect on teeth?

A. The development of the teeth—a good development of the teeth is dependent upon an adequate supply of Vitamin D.

Q. How about muscle soreness or numbness?

A. That is one of the symptoms.

Q. How about the nerves, does it have some effect on those?

A. Usually any deficiency in the cell structure of the particular system involved causes some impairment in its function.

Q. What about a Vitamin K deficiency, Doctor, what are some of the symptoms of Vitamin K deficiency?

A. Vitamin K deficiency is characterized by bleeding. However, we form Vitamin K in the intestines, so ordinarily need no Vitamin K as such as a supplement.

Q. Isn't it true that in some cases Vitamin K has proved very effective where persons have a tendency to bleed?

A. Yes, it has proved in those cases in which there is
2218 some other secondary disease.

Q. That prevents a formation of Vitamin K?

A. That prevents a formation of Vitamin K.

Q. What are some of the symptoms of Vitamin B-2 deficiencies?

A. Riboflavin deficiency is characterized by—again, this is vascularization of the cornea and sclera.

Q. Can you tell us what that is in layman's language?

A. The sclera is the white part and the cornea is the clear part of the eye.

Q. You mean sores?

A. They may go on to ulceration, but not necessarily. But the earliest symptom that you note is an increased number of capillary loops that will grow out over the sclera and the cornea.

Q. Don't you have scales or greasy accumulation on all parts of the body? Isn't that one of the——

A. These scaly and greasy accumulations you frequently see in such places as around the nose, around the mouth, behind the ears, in all flexible areas usually.

Q. Don't you have a reddening and scaliness of the lips, for example?

2219 A. That is a condition that comes as a result of the defect in the cellular function of epitheleal structures

Q. But you do have it from a Vitamin B deficiency, that is one of the symptoms?

A. Yes.

Q. Isn't one of the symptoms sores in the angles of the mouth?

A. Yes. That is called perleche.

Q. Now, Doctor, on symptoms for Vitamin C deficiency, what are some of the symptoms?

A. Usually characterized by soreness and bleeding of the gums, sponginess of the gums, X-ray changes on bone, ecchymosis of the skin due to capillary permeability.

Q. Could you explain the first word?

A. Which one?

Q. I can't pronounce it. The first word you used.

A. Ecchymosis. Ecchymosis is a small hemorrhage—are small hemorrhages.

Q. Do you also have a symptom on the Vit-man C deficiency of greater susceptibility to infection?

A. That is thought to be one of the functions that Vitamin C has, to act as a part of the structure for the gama-globulins, from which antibodies are formed. Vitamin C functions as a part
2220 of the structure in the intercellular substance.

Q. The real answer to my question is yes?

A. Yes.

Q. Doctor, do you also have the paleness that you referred to in connection with—I guess it was Vitamin A, iron deficiency?

A. Yes.

Q. And you also have a weakness of breathlessness that goes with the Vitamin C deficiency?

A. Not necessarily. Sometimes it is thought by the people who have deficient hemoglobin, the rate of formation of hemoglobin is sometimes speeded up if they have all the other necessary factors.

Q. How about rheumatic pains, is that a symptom of Vitamin C deficiency?

A. You have pains that resemble rheumatic pains that may be due to Vitamin C deficiency. Ordinarily this is only in severe cases in which you have internal joint hemorrhage.

Q. In connection with this gum condition you referred to, isn't it true that the teeth sometimes become loose?

A. Yes. You may even lose them, but that is rather severe.

Q. Do you sometimes have tensions in the bones causing swelling to elbow and ankle and other parts of the body?

2221 A. Yes.

Q. And I believe you have already referred to hemorrhages from blood vessels breaking?

A. Yes.

Q. Now, on Vitamin A deficiency symptoms, can you give me the symptoms that come from a deficiency of Vitamin A?

A. Vitamin A deficiency symptoms may be dermatitis.

Q. Is that scaliness of the skin?

A. Dermatitis refers to any skin condition, any appearance. Do you want to specify——

Q. Yes, I would like to have the specific symptoms of Vitamin A deficiency.

A. An inflammation of the skin, ulcerations of the cornea, gastro-intestinal disturbances; these are only in severe Vitamin A deficiency.

Q. Don't you have the condition known as night blindness?

A. That is nyctalopia. That is what I described earlier, where you have a defect in visual purple formation.

Mr. GOODRICH: I would like to object to this line of interrogation on the ground that it is irrelevant to the case before the court and is an effort to interrogate an employed expert by the Govern-
2222 ment on general medicine. For that reason the interrogation is improper. Under Lewis v. United Air Line Transport Corporation, 32 Federal Supplement, page 21; Boynton v. R. J. Reynolds, 36 Federal Supplement, page 593; Midland Steel Products Company v. Clark Equipment Company, 9 Federal Rules Service, 34.411, all of which hold that the opinions of hired experts are without the scope of interrogation under the oral deposition section. It has nothing to do with the findings of fact that have been made.

Mr. RHYNE: It is not necessary for me to reply to you at this time, but I will when the time comes.

By Mr. Rhyne:

Q. Now, Doctor, would you go ahead on this Vitaman A deficiency symptoms? For example, don't you have also this retardation of growth?

A. Why don't you read them off and I will say yes or no?

Q. Retardation of growth of the central nervous system when deficiency occurs in an early age.

A. That particular work was done on chickens showing the central nervous system deficiency. It has never been shown on any human beings. It is very rare that the neural findings are in Vitamin A deficiency, that it isn't a proven entity.

Q. Doctor, isn't it true that one of the symptoms of a Vitamin A deficiency is a greater susceptibility to infection?

2223 A. Vitamin A is considered to be an effective part of it.

Q. The answer to my question would be yes?

A. Yes.

Q. Now, on a Vitamin B-1 deficiency, can you tell me some of the symptoms of a Vitamin B-1 deficiency?

A. I think we have got that one. Do you want to put them in again?

Q. I believe we did cover that. Yes. You are correct.

A. I just want to save time.

Q. Now, Dr. Butz, have there ever been any controlled experiments by you or any other person, to your knowledge, with Nutrilite by the Food and Drug Administration?

A. None that I know of. However, I don't know what the vitamin division has done.

Q. If such controlled experiments had been carried out, don't you think they would be called to your attention at the time you made this finding of fact?

A. I don't believe that any experiments were done—I think they probably would have.

Q. Had you ever heard of Nutrilite before you made this finding of fact?

A. I don't believe so.

Q. Isn't it true, Doctor, that you do not know exactly
2224 what is contained in the base of Nutrilite—that is, the specific things that are named there? You do know this base of alfalfa, parsley, and watercress has never been analyzed by you or anyone else, to your knowledge, in the Food and Drug Administration, has it?

A. It hasn't been analyzed by me, and I wouldn't say that it had not been analyzed by the Vitamin Division or some other division, by a laboratory division.

Q. Well, do you know whether or not anyone has made a government assay of the contents of Nutrilite?

A. I don't know.

Q. No such assay was ever called to your attention?

A. None has been called to my attention that I can remember.

Q. Do you know that there are new vitamins being discovered all the time and that some of those could be contained in the base without your knowing it or my knowing it?

A. That is true. That part of it is true.

Q. Do you think that reports by users of Nutrilite of beneficial results are an accurate way of determining the value of Nutrilite?

A. No, I don't for this reason: Patients that are given
2225 placebos by doctors will frequently get better, and are certain that they get the best things that they possibly can get and feel greatly improved.

Q. Would you tell me what that word means?

A. A "placebo" is a sugar pill, or any other non——

Q. (interposing) In other words, it is something that the doctor gives them which the doctor knows is worthless?

A. Has no real value.

Q. But they do report benefits?

A. But they find results.

Q. Doctor, from your reading of the scientific literature in this field, isn't it true that a lot of the research people think that there are probably thousands of vitamins that haven't been defined as yet?

A. No. I think the general feeling is, the latest feeling is there may be some whose exact functions haven't been completely worked out yet, but the present-day feeling is that there is nothing which we don't have some indication of as at least a substance. For instance, up until recently, at which time B-12 was discovered, they had an anti-pernicious anemia substance, and they did not know what it was as an entity. However, there is no unknown substances which we are looking for to define as chemical entities at the present time.

2226 Q. But, the Food and Drug Administration, to your knowledge, has not made any analysis of this base of Nutrilite to determine just what it is?

A. To my knowledge, no.

Q. I believe you said, Doctor, you don't question the fact that deficiency diseases exist?

A. That is true.

Q. If it was a deficiency disease which one of the vitamins or minerals contained in Nutrilite is good for it, that Nutrilite would aid in curing or preventing it——

A. If given in sufficient quantities to cure that particular disease. I do not feel it would be the therapeutic product of choice, however.

Q. What do you mean by that statement?

A. Take an individual who had particularly, say, a B-1 deficiency. I might give him the complete B complex. However, I wouldn't want to give him this whole slug. I would give him probably, well, a cheaper form that did not contain all these other things; although they cost money to put up, they are not essential ingredients of the disease we are trying to treat. These are what we call shotgun type of things, more or less.

Q. I take it that you are opposed to shotgun medicine?

2227 A. Generally we should know exactly what we are treating before we attempt to treat it. Sometimes we do use them in the medicine.

Q. Isn't it true that especially in these so-called subacute deficiencies—I believe which you say you want to stay away from—that a doctor cannot with accuracy determine what is wrong with the patient, so that the so-called shotgun type of medicine would be the best type?

A. It is indicated in case the condition which you are treating is really a vitamin deficiency. However, most of the conditions which are subacute and are characterized mainly by symptoms of not feeling well in general are usually psychic.

Q. Doctor, how could you know that most of these conditions are psychic when you haven't examined a lot of patients for a deficiency disease in subacute cases?

A. Because a great many patients have been treated by doctors with vitamins without any relief of their prevailing symptoms and will improve on psycho-therapy.

Q. You mean you are basing this statement on reports to you by other doctors?

A. Yes. Not only that I have had a great many patients that I have dosed very heavily on vitamins when I was in the Army,
2228 for instance—we made it to rule out any possibility that there might be any deficiency from conditions under which they had lived; we gave them far beyond the required and advised minimum daily dose of vitamins, and they showed no improvement on this vitamin supplement alone.

I think probably our mental hospitals would be relieved of all problems if vitamins would take care of the emotionally unstable.

Q. Didn't I understand you to say earlier, Doctor, that vitamins in some instances at least could help the emotionally unstable?

A. Oh, yes, if the condition is due to a vitamin deficiency, that is true.

Q. What do you mean by the term "common diseases" in one of your opinions here, findings of fact? I believe it is the one dated December 9th, Doctor. Do you have it in front of you, Doctor?

A. Yes, I do. Here.

If you would refer to common diseases, you would refer to such things as you have in your family every day; such as—not every day—but cold, virus infections, bacterial infections, common childhood diseases. You would include such things as measles, scarlet fever, diphtheria.

Q. Is that the type of thing you had reference to?
2229 A. Yes.

Q. When you referred to those, then you don't find, do you, in Nutrilite's labeling any statement to the effect that Nutrilite would be useful for that type of common disease, do you?

Mr. KLEINFELD: I object to that question. It is irrelevant.

By Mr. Rhyne:

Q. You don't find that this refers to measles or any of those?

A. It refers usually to vague symptoms that may be the symptoms of a whole variety of diseases, prodromal symptoms of many diseases.

Q. But it does not refer to measles but these common diseases you were talking about.

Mr. KLEINFELD: I object to that. The witness has not professed to be an expert on labeling. He is testifying what a product of this type would do therapeutically. He is not testifying what labeling means or does not mean.

Go ahead.

THE WITNESS: You want me to answer the question?

Mr. RHYNE: Yes.

(The pending question was read by the notary-reporter.)

2230 THE WITNESS: Well, most common diseases that I would refer to would be common diseases that are characterized by these symptoms as mentioned in the finding of fact of September 30th. They would be such common diseases as diabetes, heart trouble——

By Mr. Rhyne:

Q. I was just wondering where you got the term and how you defined it since you used it there, Doctor.

A. Well, I think I got it from the general context of the book as the reference that Nutrilite would cure or mitigate any of the symptoms of the ordinary diseases to which the human race is heir.

Q. In other words, that was an over-all conclusion?

A. An over-all conclusion. Specifically, I wouldn't refer to any particular disease. I don't remember what exact pages I picked that from. I haven't any memory of that.

Q. Doctor, coming back again to your finding of fact of September 30, 1948.

A. Yes.

Q. You say it is the concensus of informed medical opinion that a product consisting of extracts of alfalfa, parsley, and so forth, and you name all the contents of Nutrilite with the exception of

2231 the alfalfa, parsley, and watercress base, would not be effective in the treatment of low vitality.

Now, since it does contain some of the vitamins to which we have referred to in discussing symptoms, don't you think that it could be effective in the treatment of low vitality?

A. It could be effective in the treatment of those symptoms which were proven to be due to a vitamin deficiency.

Q. Yes. Well, for example, if a patient did have low vitality and he was given vitamins, one of the vitamins, which one specially——

A. (interposing) For instance, if you had a feeling of low vitality due to B-1 deficiency and you gave B-1, it might improve that. If it was specifically due to B-1. However, my general position in this is this, that the Nutrilite purports to treat a general subjective feeling of a large majority of the people that they have from time to time, and suggests to them if they take Nutrilite they will be better, which is not true.

Q. Well, I want to be sure I understand you. You admit that Vitamin B-1 is just for low vitality and Nutrilite contains Vitamin B-1.

A. Nutrilite would be good for low vitality in cases where
2232 the feeling of low vitality was due specifically to a B-1 deficiency, which includes only a small segment of the population.

Q. Well, now, poor appetite, for example, I believe you have testified that that is one of the symptoms.

A. I will.

Q. Of which vitamin deficiency?

A. B-1 deficiency.

Q. Now, Nutrilite contains that?

A. Yes.

Q. So that it would be effective in the treatment?

A. It would be effective in the treatment if the poor appetite was the result of B-1 deficiency but not in the host of other diseases which are often characterized by poor appetite.

Q. I take it then, Doctor, your position is, if you have one of these named deficiency diseases and Nutrilite, or any other vitamin for that matter contains the specific vitamin that will help that deficiency——

A. In sufficient amounts.

Q. Enough in sufficient amounts, it is not your position that Nutrilite couldn't aid as well as any other vitamin?

A. That is true.

Q. For example, on heart disease, I have been told,
2233 I think, that Vitamin B-1 is of aid in the treatment of heart disease; is that true?

A. Where they have a beri-beri heart, or they have a heart that is not functioning properly due to a deficiency of B-1, B-1 will cause almost one of the dramatic returns of good function by the administration of B-1.

Q. And the administration of B-1 as contained in Nutrilite could do that as well as B-1 contained in any other factor?

A. Not necessarily. You have to qualify that. Certain people, for instance, can't take it orally. You would inject it into them. You would get a little more absorption. For instance, the liver has to be functioning in order to utilize B-1 effectively.

Q. Doctor, I take it that you don't recall just which edition of this booklet you read as you made each decision?

A. No.

Q. And your statement about common diseases is a conclusion you drew from the entire pamphlet?

A. From the entire pamphlet.

Q. Rather than any specific statement?

A. That is true.

2234 Q. You recognize that it does not contain any such specific statement?

A. I don't remember it as such. You would know that better than I.

Q. These laboratory tests that we were talking about when you were discussing how you would examine patients for vitamin deficiency of various kinds, when taken as a whole are pretty expensive, are they not?

A. That is true.

Q. Isn't it also true that in diagnosis of patients' conditions from physical laboratory results, the doctor cannot always be sure of the results?

A. Most of the chemical determinations for the vitamins with the exception of D are pretty accurate. D is a bio-assay that is done on animals.

Q. But, Doctor, since the tests that we have been talking about are not generally used by M.D.'s—I believe you agree to that?

A. They are not used by the ordinary, general practitioner.

Q. Isn't it true that the tests that are used by the ordinary, general practitioner are not too accurate on testing for vitamin deficiencies?

2235 A. The testing that they do represents a composite of their opinion. What it comes down to is a validity of diagnosis. I think that in hospitals the diagnoses are found to be pathologically accurate in about 66 percent of the cases.

Q. What I had in mind was, Doctor, that I believe it is a generally recognized fact that an ordinary M. D. often differs with another M. D. on diagnosis of a deficiency disease.

A. Well, I have never heard much discussion of that particular thing. When a deficiency disease is sufficiently apparent, it is the signs and symptoms which are pretty clear-cut.

Q. But when it is in a subacute stage——

A. When there are feelings of malaise, low vitality, insomnia and poor appetite, you are not positive in that case, it is true.

Q. That is where most of the difference of opinion exists?

A. Where there is no clear-cut entity, then there is a possibility of difference of opinion.

Q. Isn't it true that doctors often use trial and error methods in getting the patient's reaction as they go along with each trial?

A. They sometimes do.

Q. So that the reaction of a user to a particular product
2236 or patient to a particular product is important then?

A. The reaction of the particular patient is important.

Q. Doctor, is it true that certain physical conditions such as fevers and infectious diseases require larger amounts of vitamins and minerals to sustain a patient?

A. That is true.

Q. I was going to say, than in a normal condition.

A. That is true.

Q. Doctor, you haven't seen any facts indicating that Nutrilite is actually, or its labeling has actually harmed anyone, have you?

A. I have never seen where Nutrilite has ever harmed anybody. I would assume a certain number of people would be misled by it, into taking it when they had other conditions which might be serious.

Q. But you know of no such instances?

A. I know of no such instance.

Q. Doctor, in the treatment of chronic diseases, is it true that a doctor can always diagnose accurately the time when such a disease begins?

A. No, you can't always tell when a disease begins. For instance,
tuberculosis, you might have that for a long time, quite a
2237 while, before you knew it. In fact, one of the early things
that you might have would be a feeling of low vitality and early fatigue, insomnia—in fact, inability to sleep is one of the early signs of a toxic product of tuberculosis.

Q. You mentioned tuberculosis. Isn't it true, Doctor, that vitamins and minerals would help build up resistance to tuberculosis?

A. A person has to have an adequate diet in order to maintain their resistance if in case they have tuberculosis. One of the things you have in a hospital is a high protein, high vitamin diet. You don't always supplement them with anything, but you give them a high protein, high vitamin diet. Plenty of rest.

Q. Doctor, do most doctors bring about an immediate improvement with patients with chronic ailments?

A. No, unfortunately.

Q. I believe you said earlier when you referred to chronic ailments you include things other than, say, the incurables like cancer——

A. I include everything in chronic diseases.

Q. It is a broad term?

A. Chronic diseases refers to those diseases which you have over
a prolonged period of time.

2238 Q. Well, if somebody uses the word "chronic," you don't
understand by that, that they are referring to cancer, is what I mean?

A. Not necessarily, no.

Q. Do you think it is impossible for a layman to recognize the symptoms of a deficiency disease?

A. No, provided the layman has had some special training of some kind so he has had an opportunity before to have observed it.

Q. Or to read about it or experience it?

A. If he is experienced and it has been diagnosed for him, then he has a better chance than somebody else. However, in that regard I might say that many doctors who have seen a disease many times, if they have it themselves, will frequently miss it because they are unwilling to accept the fact that they have it or they don't want to concede that they do have it themselves. You know, they say that a doctor who is his own physician has a fool for a patient and has a fool for a doctor.

Q. Doctor, you say you gave vitamins in the Army to rule out vitamin deficiencies?

A. Yes.

Q. Why can't an ordinary user or mother do the same with her family?

2239 Mr. KLEINFELD: I object to that question, the entire line of questioning, because the issues in this case are not the efficacy or lack of efficacy of vitamins, but as to whether the labeling of this product Nutrilite is misleading in a material respect.

THE WITNESS: A mother could treat her infant if she knew that the thing that the child was complaining of was a vitamin deficiency.

However, the probabilities of her being right are a little less than somebody better trained. That is all.

By Mr. Rhyne:

Q. It certainly wouldn't hurt the child?

A. Most vitamins are not considered to be injurious per se.

Q. Doctor, isn't there quite a wide difference of medical opinion with respect to the value of vitamin E in the human diet?

A. There is a small group who believe that Vitamin E has some value. However, the great majority of physicians who are nutritionists do not feel that the use of Vitamin E is sufficiently substantiated at the present time to indicate its use. I refer to such things for which claims are made that you mentioned, heart
2240 disease, certain types of heart disease and diabetes. This work has not been substantiated sufficiently to make the present-day feeling that it is effective in human diseases.

Q. Doctor, if the reaction of the patient is important, and I believe you so testified, wouldn't the results which users of Nutrilite have experienced be also important?

A. They would be important if they were qualified to evaluate the feelings that they got.

Q. When you speak of feelings, don't you think they know more about that than they can tell anybody else?

A. They know how it feels but they don't know that the feeling came from Nutrilite. The improvement is not necessarily from Nutrilite. The feeling is that they just felt better.

Q. Isn't it true that these deficiency diseases sometimes occur as complexities rather than single entities?

A. Usually that is true.

Q. So that use of multiple vitamins would be indicated in such instances?

A. Ordinarily, when they have one deficiency you usually give the other ones of the same group.

Q. Do you think that many general practitioners make errors in diagnosis of deficiency diseases?

2241 A. I think it is possible that some are made.

Q. Don't you think that they make many errors because they don't have this equipment to which you refer?

A. No. I think that any disease which is sufficiently clear-cut will not be missed by the practitioner. However, I think the group that you are referring to is what they call a sub-clinical group, which is no proven disease anyway. They feel that is what the condition is due to and they hang their handle on it.

Q. Doctor, are there not many types of vitamin deficiencies which are characterized by loss of appetite, say, insomnia, irritability, fatigue, and so forth?

A. There are vitamin deficiencies that are characterized by those symptoms and also other diseases characterized by the same symptoms, to which vitamins would be valueless.

Q. But the vitamins would also be of value if it came from a vitamin deficiency?

A. The vitamins would be valuable if it came from a vitamin deficiency.

Mr. Rhyne: That is all.

Examination by Counsel for Defendants.

By Mr. Kleinfeld:

Q. Dr. Butz, you signed a finding of fact on December 9,
2242 1948, that it was the concensus of informed medical opinion that most common diseases do not result from dietary deficiencies and that a product consisting of the elements contained in Nutrilite would not be effective in preventing or treating most common diseases; is that correct?

A. That is true.

Q. Is it your present view that that is the concensus of informed medical opinion?

A. It is.

Q. Is it your opinion?

A. It is my opinion and the opinion of other men.

Q. Is it a fact, Dr. Butz, that on December 30, 1948, you signed a finding of fact which state that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of gastro-intestinal distress?

A. That is true.

Q. Is that your present opinion?

A. It is still my opinion.

Q. Is it a fact that on September 30, 1948, in that same finding of fact you stated that it is the concensus of informed medical opinion that a product consisting of the elements and substances con-

2243 tained in Nutrilite would not be effective in the treatment of nervousness?

A. That is true.

Q. Is that still your opinion?

A. It is still my opinion.

Q. Do you still believe that is the concensus of medical opinion?

A. I still believe that.

Q. Is it a fact that on December 30, 1948, you signed the finding of fact to the effect that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of heart disease? Is that a fact?

A. That is true.

Q. Is that still your opinion?

A. It is my opinion that it might be effective in that particular form of heart disease which is due to a vitamin deficiency. However, a great majority of conditions that are covered by the term "heart disease" would not be benefited.

Q. How about angina pectoris?

A. Would not be benefited.

Q. How about arteriosclerosis?

Would not be benefited.

2244 Q. Is it a fact that on September 30, 1948, you signed a finding of fact that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of disease conditions requiring surgery?

A. It would not be effective in a diseased condition requiring surgery.

Q. Is it your view that that is your concensus of informed medical opinion?

A. It is.

Q. Is it a fact on September 30, 1948, you signed a finding of fact that it is a concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of feebleminded-ness?

A. It would not be effective in the treatment of feebleminded-ness.

Q. You said that was the concensus of informed medical opinion at that time?

A. Yes.

Q. Do you still believe it is the concensus of informed medical opinion?

A. I believe it is. Because the feebleminded people
2245 are congenitally mentally incompetent.

Q. Is it a fact on September 30, 1948, you signed a finding of fact to the effect that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of diabetes?

A. It would not be effective in the treatment of diabetes.

Q. It was your view on September 30, 1948, that it was the concensus of informed medical opinion that it was not effective?

A. It would not be effective in the treatment of diabetes.

Q. I want to give you the same question with respect to hemorrhage connected with the menopause.

A. Hemorrhage connected with the menopause is a symptom which at that age might suggest cancer. If the person was in the menopausal age and had bleeding, I would suspect cancer rather than a vitamin deficiency.

Q. So your answer is——

A. (interposing) The indications are that she might have not only cancer but she might have what we call myomas, muscle
2246 tumors of the uterus which frequently cause bleeding. She might have the early forms of hormonal imbalance, which might cause bleeding. Either hyper or hypothyroidism will cause excessive bleeding. All these conditions would not be benefited in any way by vitamin therapy.

Q. Is it a fact that on September 30, 1948, you signed a finding of fact which stated that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of l-ukemia?

A. The l-ukemias are a group of blood dyscrásis which could not be benefited by vitamins. In fact, l-ukemias are considered to be a form of blood cancer for which X-ray, nitrogen mustards and radioactive phosphorus have been tried and are found to be the most useful in that treatment—in the treatment of these conditions.

Q. Then, as I understand your answer, is it that a product containing the substances that Nutrilite contains would not be effective in the treatment of l-ukemia by the concensus of informed medical opinion?

A. It would not be effective for the treatment of l-ukemia.

Q. On September 30, 1948, did you sign a finding of fact
2247 to the effect that it is the concensus of informed medical opinion that a product containing the substances and elements that Nutrilite contains would not be effective in the treatment of tuberculosis?

A. Would not be effective in the treatment of tuberculosis. The Nutrilite could only be considered as an adjunct therapy in the treatment of tuberculosis. Tuberculosis requires many times surgical treatment, you have to cut the adhesions so the lung collapses and has a sufficient blood supply so as to effectively ward off and kill the area which has tuberculosis bacill*a* in it.

Q. In your opinion, Doctor, would a product containing the ingredients and substances which Nutrilite contains, as set forth in the label of Nutrilite, which I show you—would such a product be effective in the treatment of cancer?

A. It would not.

Q. What is the concensus of informed medical opinion as to whether a product such a Nutrilite containing the ingredients and substances set forth on the label of Nutrilite—what is the concensus of informed medical opinion as to whether such a substance would be effective in the treatment of cancer?

A. Nutrilite could not possibly be effective in the treatment of cancer because cancer is a condition in which you have aber-
2248 rant controlled growth of cells which have never been found capable of being treated by vitamins.

Mr. RHYNE: I want to object to all the questions about cancer and move to strike the answers on the ground that cancer is not mentioned in the labeling of Nutrilite and the Doctor's finding of fact doesn't refer to cancer in any place.

By Mr. Kleinfeld:

Q. Dr. Butz, if a person was suffering from a continuous hoarseness of the throat which persisted for some time, might that be due to a number of physical conditions?

A. Hoarseness of the throat——

Mr. RHYNE (interposing): I object to that on the ground that there is no mention of hoarseness of the throat in the Doctor's finding or in the labeling of Nutrilite.

THE WITNESS: Hoarseness of the throat could be due to tuberculosis, cancer, strictures, due to injuries of any kind. It could be due to a neurological involvement, brain tumor.

By Mr. Kleinfeld:

Q. If a person had hoarseness of throat, chronic hoarseness of throat due to cancer or brain tumor——

Mr. RHYNE: Same objection.

By Mr. Kleinfeld:

Q. (continuing)—and he did not seek medical advice, might real and permanent physical damage be done to the person?

2249 Mr. RHYNE: I object on the same ground, that there is no reference to either condition in any of the labeling of Nutrilite.

Mr. KLEINFELD (to the witness): Go ahead.

THE WITNESS: He could sustain permanent and probably fatal injuries resulting from postponing treatment. Especially since cancer of the throat is a thing which has to metastasize only a very short distance before it becomes inoperable.

By Mr. Kleinfeld:

Q. Doctor, supposing a person were suffering from loss of weight and persistent coughing, might those symptoms indicate that the person was suffering from tuberculosis?

Mr. RHYNE: I object on the same ground, there is no reference to that in the labeling of Nutrilite in any place or in the Doctor's finding.

Mr. KLEINFELD: The Doctor's finding mentions tuberculosis.

(To the witness): Go ahead, Doctor.

THE WITNESS: Tuberculosis is a condition which comes on very insidiously and which might be characterized by some of the symptoms mentioned in the finding of fact, such as fatigue, easy fatigue, loss of appetite, insomnia, and which would specifically be
2250 characterized by hoarseness if he had laryngeal tuberculosis. Any other place he could have general systemic conditions which would resemble many of the conditions mentioned in the finding of fact.

By Mr. Kleinfeld:

Q. What effect on such a person and on such a person's health would be the advice to remain away from a doctor for months?

Mr. RHYNE: I object on the ground that there is no such advice contained in the labeling of Nutrilite.

Mr. KLEINFELD (to the witness): Go ahead.

THE WITNESS: If a person would stay away from adequate medical care, he might recover from tuberculosis on his own, but the probabilities are very, very seriously against that, and the probabilities are that the condition would progress to the place where he would no longer be able to be reached and given medical care in such a way as to cure him of tuberculosis.

By Mr. Kleinfeld:

Q. If such a person had tuberculosis, would you say, as is stated on page 21, of this pamphlet, "How to get well and stay well," and I quote:

"First, if the ailment is chronic rather than acute, no harm can come from the use of the process of physical
2251 rebuilding through food and the Nutrilite since the ailment has likely been plaguing the person for considerable time and the sufferer is still alive, a few months devoted to rebuilding the body can hardly make things worse."

Do you believe that a few months devoted to rebuilding the body through the consumption of a product like Nutrilite and keeping away from competent medical advice would hardly make things worse?

Mr. RHYNE: I object to the question on the ground he hasn't read the entire statement, particularly the next statement which is:

"Second, if the ailment is acute, in addition to the physical rebuilding through food and Nutrilite, medical aid is solicited."

Mr. KLEINFELD (to the witness): Please answer my question.

THE WITNESS: In case that an individual would postpone treatment for tuberculosis, the probabilities are that they would get progressively worse and would probably get beyond the stage where any treatment would be of any use to them. This also applies to other things which you don't recognize at the time and which you can sustain irreparable damages, such as diabetes. I think it mentions just chronic diseases.

2252 Mr. KLEINFELD: I was asking about tuberculosis.

THE WITNESS: Tuberculosis could progress to a state where he could sustain no benefit even from medical care if it isn't taken

care of early. Those few cases which have gotten better by themselves represent a small proportion.

By Mr. Kleinfeld:

Q. If a person was suffering from diabetes and didn't know it, had the symptoms which came from diabetes, and devoted himself to the consumption of a product containing the elements in Nutrilite, devoted a few months to such consumption rather than going to a physician, would you say that would hardly make things worse?

Mr. RHYNE: I object on the ground there is no statement contained in the labeling of Nutrilite.

THE WITNESS: Diabetes is a disease in which vascular changes occur if it isn't controlled. These vascular changes can only become worse if the disease is not controlled. An attempt at substitution therapy such a Nutrilite would permit prolongation of the serious secondary effects of diabetes.

By Mr. Kleinfeld:

Q. Might such advice to a person who had diabetes result in his death?

2253 A. It might hasten his death.

Q. Doctor, on September 30, 1948, did you sign a finding of fact that it is the concensus of informed medical opinion that a product consisting of the elements and substances contained in Nutrilite would not be effective in the treatment of all deficiency diseases?

A. I did.

Q. It was your view on September 30, 1948, that it was then the concensus of informed medical opinion that such a product would not be effective in the treatment of all deficiency diseases?

A. It would not be effective in the treatment of all deficiency diseases. Deficiency diseases are protein deficiency diseases, which wouldn't have anything to do with vitamin deficiency diseases.

Further examination by counsel for plaintiff:

By Mr. Rhyne:

Q. Doctor, when you say in your opinion of December 9 that it is the concensus of informed medical opinion that most common diseases do not result from dietary deficiencies, you don't mean to imply, do you, that deficiency diseases could not come from a lack of vitamins and minerals, do you?

2254 A. Deficiency diseases that are vitamin deficiency diseases would come from a lack of vitamins.

Q. And you don't include those within the term "common diseases"?

A. I don't include those within the term "common diseases," because vitamin deficiency diseases are not common.

Q. Now, when you say that the contents of Nutrilite would not be effective in all deficiency diseases, you didn't mean to imply, did you, that it would not be effective in the treatment of some of the ones?

A. No. Nutrilite would be effective in the treatment of certain deficiency diseases if the deficiency diseases were definitely known to exist, and a sufficient dosage was given to treat the disease.

Q. When you term "all deficiency diseases," you were thinking of the broad picture rather than specifically deficiency diseases for which Nutrilite might be of aid?

A. That is true. Nutrilite may be of aid in those deficiency diseases in which it was definitely established that the vitamin for which Nutrilite, the vitamin deficiency had been given, had the vitamin in a sufficient quantity.

Q. Now, in your questions from Mr. Kleinfeld you had quite a discussion of tuberculosis. I believe in your earlier testimony
2255 you did indicate that vitamins and minerals could be of aid as an adjunct.

A. That is true.

Q. So therefore the multiple vitamin makeup of Nutrilite could be a valuable adjunct in the treatment of tuberculosis?

A. It could be.

Q. Now, when you were discussing hemorrhage connected with the menopause, your objection to the statement is that it is too broad rather than the fact that the vitamins and minerals contained in Nutrilite couldn't have been of some assistance, isn't that true?

A. The bleeding of menopause would only be due to a vitamin deficiency very, very rarely, in which probably the deficiency would probably be a vitamin C deficiency.

Q. I mean, it is possible that there are instances if there was a vitamin C deficiency and Nutrilite supplied it, it could be of assistance?

A. It could be of assistance. That possibility, as I indicated, I would consider very rare.

Q. In your statements about mental diseases, again, I take it that your finding of fact stated on the over-all picture rather than the fact that in some instances vitamins and minerals such as those contained in Nutrilite can assist people with mental disturbances—isn't that true?

2256 A. Mental disturbances are so rarely due to vitamin deficiency that except in conditions like pellagra in which you

have definite indication of vitamin deficiency, it is characterized by mental symptoms, the vitamins would be valueless.

Q. But if you did have the symptoms, of which you speak, why, vitamins such as Nutrilite could be of assistance?

A. In case your emotional instability, mental difficulty, would be due to a vitamin deficiency, then Nutrilite could be provided for that function. As I indicated before, that is very rare.

Q. Without going through each one of these conditions here, Doctor, I take it that your finding of fact is based upon the broad fact, say, all people included within the group of low vitality rather than upon the idea that specific vitamins and minerals could be of aid in curing a specific deficiency related to that—isn't that true?

A. That is true.

Mr. RHYNE: That is all.

Further examination by counsel for defendants:

By Mr. Kleinfeld:

Q. I understand, Dr. Butz, that you have said to Mr. Rhyne that if a person is suffering from a disease such as a
2257 deficiency disease caused by an insufficient intake of vitamins, then a product like Nutrilite might be of help?

A. That is true.

Q. Then if this same person is suffering from one of the diseases mentioned in your finding of fact dated September 30, 1948, such as sinus trouble, which is not caused by an insufficient intake of vitamins and minerals as contained in Nutrilite, would that person be helped by a consumption of Nutrilite?

A. He would not. Most of the sinusitis of that type are due to an anatomical configuration that don't lend themselves readily to draining.

Mr. KLEINFELD: That is all.

Mr. RHYNE: That is all.

Mr. KLEINFELD: Counsel for the defendants want to state for the record that they are offering Mr. Rhyne for his observation and information a letter dated October 16, 1948, from the American Medical Association to Dr. E. M. Nelson, Food and Drug Administration, Washington, D. C., and a copy of a reply dated November 10, 1948, from Dr. Nelson to Mr. Oliver F. Field of the American Medical Association.

2258 I have read the foregoing 84 pages, which contain a correct transcript of my answers to the questions therein recorded.

.....

CERTIFICATE OF NOTARY PUBLIC

I, August Wolff, the officer before whom the foregoing deposition was taken, do hereby certify that the witness whose testimony appears in the foregoing deposition was duly sworn by me; that the testimony of said witness was taken by me in shorthand and thereafter reduced to typewriting under my direction; that said deposition is a true record of the testimony given by said witness; that I am neither counsel for, related to, nor employed by any of the parties to the action in which this deposition was taken, and further that I am not a relative or employee of any attorney or counsel employed by the parties hereto, nor financially or otherwise interested in the outcome of the action.

2259 DEFENDANT'S EXHIBIT 15

FEDERAL SECURITY AGENCY

OFFICE OF THE ADMINISTRATOR

CERTIFICATE

October 10, 1949

Pursuant to the provisions of Section 1601, Chapter 10, Title 42, United States Code (55 Stat. 184), I hereby certify that the attached

Copy of Finding of Fact to support multiple seizures of the drug "Nutrilite Food Supplement", signed by Robert C. Butz, M.D., Medical Officer, Food and Drug Administration, dated December 2, 1948 and the Conclusion signed by Geo. P. Larrick, Associate Commissioner of Food and Drugs, dated December 2, 1948,

are true copies of official documents on file in the Food and Drug Administration of the Federal Security Agency and are part of the official records of said Administration and Agency.

In witness whereof, I have hereunto set my hand, and caused the seal of the Federal Security Agency to be affixed on the day and year first above written.

By direction of the Federal Security Administrator.

L. T. O. A'Hearn,
Acting Executive Assistant (Seal)

2260 FEDERAL SECURITY AGENCY

FOOD AND DRUG ADMINISTRATION

Washington 25, D. C.

5-610 K
Nutrilite Food Supplement

FINDING OF FACT

It is the consensus of informed medical opinion that a product consisting of extracts of alfalfa, parsley, and water cress fortified with crystalline vitamins and vitamin concentrates which provides in the suggested daily intake the following:

Vitamin A, 25,000 U.S.P. units.
Vitamin B_1, 20 milligrams.
Vitamin B_2, 10 milligrams.
Vitamin C, 200 milligrams.
Vitamin D, 2500 U.S.P. units.
Vitamin B_6, 4 milligrams.
Vitamin E, 10 milligrams.
Vitamin K, 0.4 milligram.
Inositol, 20 milligrams.
Para-aminobenzoic acid, 20 milligrams.

together with a product consisting of bone meal, dicalcium phosphate, iron ammonium citrate, potassium iodide, niacin amide, and pantothenic acid which provides in the suggested daily intake the following:

Calcium, 950 milligrams.
Phosphorus, 562 milligrams.
Iron, 10 milligrams.
Iodine, 0.4 milligram.
Niacin amide, 15 milligrams.
Pantothenic acid, 8 milligrams.

would not be effective in the treatment of the conditions mentioned directly or by implication in the statements quoted in Exhibit "A" attached.

/s/ Robert C. Butz, M. D., Medical Officer
Food and Drug Administration

December 2, 1948

2261 CONCLUSION

Pursuant to the provisions of the Federal Food, Drug, and Cosmetic Act and regulations promulgated thereunder, I conclude on the basis of the facts reported above by Dr. Robert C. Butz, an

employee of the Food and Drug Administration of the Federal Security Agency, that there is probable cause for me to believe, and I do believe, that the labeling of this article would be and is in a material respect misleading to the injury or damage of the purchaser or consumer.

/s/ Geo. P. Larrick
Associate Commissioner
of Food and Drugs

For the Administrator, December 2, 1948.

2262 EXHIBIT "A"

(Quoted from booklet entitled "How to Get Well and Stay Well")

How to get well and stay well.

If your health problem is the result of dietary deficiencies, and if you want to get well and stay well, be sure to read this book. Even if you are sure your diet has nothing to do with your ailment, read this book now, because science is connecting more and more physical troubles with diet and nutrition. If your health is good read this book and learn how to stay well.

Published by Mytinger & Casselberry, Inc. Wholesale Distributors Nutrilite Products * * *

* * * What we have tried to do in this book is show the average American, ill with the usual American deficiency ailments in the customary chronic manner, what may be the cause of his illness, and how he should proceed to get well and stay well.

* * *

Please remember, then, that this book is designed to bring you some little-known or not-often-thought-of facts about your health and the health of your family. * * *

Are you a victim?

Are you suffering from hidden hunger?

Are you slowly starving to death?

* * *

* * * Just look around you at the members of your family, at your neighbors, friends and relatives—at yourself. Can you find even three or four who are absolutely and completely well? Are *you* enjoying perfect health?

On the other hand, think of your friends and relatives, one after the other, and note how many are weak and lacking in energy, having trouble digesting their food or suffering with actual stomach pains, with decaying teeth, trouble with their hearts and other important organs, and with aches, pains and discomfort in various parts of their bodies. Think of your friends and relatives and note how many, in the last six months, have been to doctors or hospitals for treatment. Think of those who *should* be having physical help of some kind, but who are not receiving it. And finally think of

people you know, your age and younger, who have *died* in the last year, prematurely.

* * *

* * * The healthy individual *feels* good. He has a constant awareness of his body functioning properly and feeling good. He enjoys getting hungry; he relishes his food, and he enjoys the feeling of well-being which comes with his healthy digestion. He enjoys exercise, likes to get tired occasionally, and appreciates a rest. He never complains of his physical condition, since it is always good.

* * * The healthy person * * * is calm and relaxed, with his abundant energy under control. His thinking is clear, and this, coupled with his energy, and full use of his faculties * * *

Now—what do you think? How many of the people in your family meet these health requirements? How many of your friends measure up to these standards? Do *you?* Don't you think the facts point to the need for *something?*.

2263 What good health means to your body.

Having seen what good health means to *you*, let's see what good health means to *your body*.

All your senses—sight, taste, touch, hearing, and sense of smell operate *in* your body, and they depend, consequently, on your physical condition for their correct operation. If your sense organs, and your brain and nervous system have been supplied constantly with all essential materials for their growth, maintenance and operation, and your body chemistry is normal, then, barring accidents, you will be in full possession of your faculties. If your sense organs have been partly starved, you will have difficulty seeing, hearing, or functioning in other ways.

Your brain is one of your most important organs, and it operates in close association with the spinal chord, for the control of muscle movements. When the cells of the brain and nervous system are properly nourished, and the body chemistry is correct, the thought and behavior processes proceed normally. Damage to the brain or nervous system, whether due to accident or to breakdown due to insufficient supply of building material for the cells, usually results in at least a partial inability to move the various parts of the body, (stroke or paralysis) and at least a partial breakdown of the thought process (confused thinking).

* * * When you heart functions normally and beats regularly and strongly you go along like a $10,000 car running down hill. But when you fail to supply your heart with the necessary materials to keep it constantly rebuilt, and when your body chemistry is bad, your heart breaks down, and you acquire one of the various forms of heart trouble due to dietary deficiencies.

* * * when the body chemistry is bad, or the glands themselves begin to waste away due to failure to keep them supplied with the necessary building material, our personalities do undergo enormous changes, and the whole operation of the body becomes a burden.

* * * Perfect teeth are possible, and decaying teeth are sure signs of a body which is falling apart.

Now it might be interesting to study your family, your relatives, friends and yourself along these lines too, and see how you all check up. Do any of you have difficulty seeing, hearing, or failure of other sense organs? Does anyone have to be careful not to overexert? Any with extreme personality changes? Any with false teeth? Any other evidence of failure of the various organs and glands of the body? Any illness, breakdown or invalidism? Any weakness or incapacity?

Nobody *wants* to be ill. Nobody chooses to have a body racked with aches and pains. But the fact remains that various deficiency ailments sneak up on us, and unless we take proper precautions now, eventually we may find ourselves bound, and in the power of some deficiency disease, if it has not occurred already.

* * *

Did you know that twenty-two million children in the United States need corrective treatment, ten million of them have bad teeth, six million are suffering from glandular disturbances, four million are improperly nourished in other ways, one million have tuberculosis and one million have spinal curvature—and even the curvatures may originate in deficiencies in protective food values?

Unhealthy, sickly, malnourished children are a thorn in the flesh. Being sickly; they are petulant or sullen. Being malnourished, their nervous systems do not operate correctly, and they learn with
2264 greater difficulty, both in school and at home. In addition there is the bother, trouble and expense occasioned by the constant treatment required, if the child has some definite ailment. And finally, there is the blight put upon the child's whole future, when he gets a wrong start at home.

* * *

* * * if you don't want sickly children, you must see that they are properly nourished, and if you want healthy adults you must see that they are well nourished as children.

Some obvious conclusions.

This little study of the children of America shows that millions of children all over the country, are ill.

Your study of yourself, the members of your family, your relatives and friends has shown you that almost *everyone* is more or less ill.

When you become ill, it costs money and time and trouble to get well again. It robs you of working time. And *it hurts!*

Obviously it is better to *keep* your body in splendid condition. But if your body has already begun to break down, as is the case with most of us, and which you recognize through your aches, pains, inconveniences and doctors' diagnoses, you can still do much toward returning it to it's basic and natural condition of health.

But before we tell you exactly how to do this—let us tell you a story.

* * *

Carl Rehnborg * * *

* * * went into the slums of the great city, where poverty, ignorance, filth and disease had created an appalling death rate among the new-born and opened a tiny nursery. * * *

* * *

* * * he was convinced that the vitamins, the various minerals, and certain other essential diet factors * * * were present in many raw foods. * * *

* * *

So, with continued feeble health or early death facing his infant patients, Mr. Rehnborg went out and gathered quantities of green grass, alfalfa, and other fresh green plants—scrubbed them thoroughly to rid them of all foreign matter, then carefully dried and ground them to a powder. Mixed into a thin gruel, he fed this powder to the babies, along with their milk.

* * *

* * * he grew his own green plants * * *

And when his plants were harvested, processed, and added to the diet of the babies in his clinic, not one failed to respond as expected!

* * * he had developed a practical formula for more perfect chemical balance for the body, which would help restore normal organic function, increase resistance to infection, and contribute to the upbuilding of the body so that it could throw off symptoms of disease and maintain complete health.

* * * he still further perfected this food supplement by his own elaborate and ingenious extraction processes, discarding the non-essential cellulose and other parts of the plants, so that much value could be concentrated in small volume * * *

* * *

2265. When Mr. Rehnborn returned to the United States * * * he began a * * * period of intensive study and experimentation, to improve his food supplement. At last, * * * when he considered his formula sufficiently developed to warrant making his food supplement available to the public, he started to manufacture it, * * * This all led to further development and improvement and the creation of the present amazing food supplement * * *

* * *

* * * almost all members of our families have bodies which are malnourished, and show evidences of the malnutrition which causes most of our common deficiency ailments.

* * *

So the purpose of this book—and the objective of the person who lent you this book—is to bring you to the point where you will recognize the fact clearly that your illness and the illness of your family is, in almost every case, the result of a failure to supply your body and the bodies of the members of your family with the vital food factors. You must realize that if you wish to preserve your health and the health of your wife or husband, have healthy, happy children, fight off the common deficiency diseases yourself, and enjoy vibrant health and an active old age, you must put into your body all the food factors required by it.

This book tells you how to do this, and it supplies the answer to the enigma of modern medicine—why some people get sick so easily, and get well with such difficulty.

* * *

* * * give a little thought to what you put into the bodies of your wife or husband—into the bodies of your children—into your *own* body?

And remember your reward—a good chance for the relief of deficiency ailments if you have any (and most of our current and common ailments result from deficiencies) and their prevention if you are now lucky enough to be free from them. * * * Remember this . . . the American diet is deficient in protective food factors.

* * *

* * * the protective food factors—those little things that you and I eat, that enable us to convert our ordinary foods into energy, new skin, blood and cells, and which make it possible for the body chemistry to operate correctly. These elements in our food are called, in the text books of the bio-chemists, *nutrilites*. That's a technical word you won't find in your dictionary, but it means all the little food factors—not the fats, minerals, carbohydrates, and proteins we hear so much about, but all the factors such as the vitamins, chlorophyll, bios, inositol, and many others.

* * *

* * * no one knows how many vitamins there are. * * * the nutrilites * * * are all the little vital food factors, including the familiar vitamins. * * * if you want to be healthy, you will make sure that your daily diet includes not only all the vitamins, but *all the nutrilites*.

* * *

* * * Diet deficiencies bring on old age. * * *

* * * diet deficiencies bring on aches and pains. * * * Most of our common diseases, with the exception of germ diseases, but in-

cluding some of the most painful, the most common causes of death from illness * * * and many which are considered incurable, are the result of dietary deficiencies.

2266 * * * simply through changes in diet, you can * * * bring on premature old age, create a wide variety of aches and pains and illnesses, bring about death or, when the person is deficient, *feed* him back to health!

Any food supplement which is right, and which is able to protect you from the ravages and pain of the deficiency diseases, must contain all the vitamins * * * together with all the nutrilites and minerals so often lacking in our diet.

A CONTRIBUTION TO THE STUDY OF NUTRITIONAL STATUS IN RURAL AND URBAN POPULATIONS

PREFACE

The exigencies of war have imposed the necessity of conserving all national resources, human and material, for civilians as well as armed forces. This has attracted unusual attention to the nutritional state of the population as a whole, because physical stamina must be at a peak if a nation at war is to carry on the conflict and produce the materials of war with the highest efficiency, without exacting a heavy toll on the well-being of the people individually. Moreover, those not actually engaged in the conflict on the field of battle or on the production front require a state of nutritional well-being of the highest order, since the pressures of the times in terms of war and rationing are uncommonly heavy.

In war much more than in peace, an inventory of the status of nutritional welfare of a people becomes as much a matter of good judgment as a catalogue of the national resources of a material nature, or more so.

Unfortunately, a census of the nutritional state of all American people has never been compiled, chiefly because objective criteria for judging the manifold evidences of good or bad nutrition are of recent origin, as yet unstandardized in the main. Most of the surveys in the past on malnutrition—a term which means imperfect nutrition, whether it be general undernutrition or poor balance of nutrients—have been based upon diet records solely. These have had the advantages of making it possible to include large segments of the population in a single study, and of allowing the apparent extent of dietary inadequacies to be ascertained from the amounts of foods and nutrients recorded as consumed.

The food record study, however, unless accompanied by nutrition measurements of the persons themselves, does not estimate the extent of malnutrition, because such calculations to date have been based entirely or in considerable part upon the nutrient content of raw foods as obtained from tables of averages, which are higher in nutrient content in many respects than the same foods after storage, shipping, processing, or cooking. Not until now are widespread studies in progress throughout the country on the effect of such processes upon the nutritive value of many kinds of foods. Moreover, methods of analysis of foods for some of the vitamins are of recent origin and have not yet been applied to a considerable number of foods. In addition, people are not uniform in their utilization of foods, and hence food records, even if they were meticulously accurate with

respect to nutrient content, may not be in perfect accord with the nutritional state of the persons who consume the food.

Nor are records of illness the country over, or mortality statistics—sometimes cited as proof of low or high prevalence of malnutrition—usually the former—a criterion for judging the nutritional state of a people. As Jolliffe, McLester, and Sherman (6) point out, mortality rates, as published, do not furnish a reliable index of deaths from malnutrition. Moreover, the morbidity rates for malnutrition are high in proportion to mortality; and no generally accurate morbidity rates are available because medical attention is not sought in all cases of malnutrition, even of those which would be regarded as of a gross pathological type. Moreover, none but the advanced stages of malnutrition are recognizable in the visual medical examination, even if the majority of the population were examined at reasonable intervals.

In the final analysis, nutrition tests on human beings themselves offer the only direct evidence of nutritional status. Since the tools and techniques for measuring the physical state of a human being in so far as it is related to nutrition still are confined chiefly to the research laboratory, it is necessary to study carefully the findings of all studies of this type which have been made, and to await the completion of other studies of the kind, in order to estimate the extent of undernutrition of people generally. The assessment of representative samples of the population for as many clinical and sub-clinical evidences of the nutritive state as are measurable by the techniques available at the time when the study is made, and the keeping of diet records on the basis of the weight and measure of foods actually consumed, offer the best means known at present for obtaining data on the state of nutrition of representative samples of people. The persons observed in such a study must be very carefully selected so as to be typical of the larger population which they presumably represent, because the number of subjects who may be included in a study of this type obviously is smaller than that which may be covered by food surveys, or by an examination of morbidity and mortality statistics.

The type of inquiry under discussion, where nutritional state and food consumption are recorded concurrently for representative people, still is rightfully called a *mass study*. This is true even though the number of cases observed can not approach that in the survey types of investigation just discussed, because of the far greater requirements in facilities and personnel for the more intensive studies. The mass nutrition studies, on the other hand, deal with considerably larger numbers of people than do the still more intensive nutrition studies, in which a few subjects are observed for a considerable

length of time, with periodic re-examinations, and usually with some altered dietary or other regimen related to nutrition.

The so-called mass studies in human nutrition, which are of relatively recent introduction, involve a careful recording of the dietary intake of representative people in many walks of life (still calculated for nutrient content from the best tables of averages, because facilities for analyzing samples of each meal over a period of at least a week for a considerable number of people is impracticable at present), and the concurrent measurement of these same people for their responses to certain nutritional tests. The tests used as evidences of undernutrition can be classified broadly in three groups:

The first group includes tests of long standing and unquestioned value, such as the medical examination, the dental examination, body build measurements, and tests for hemoglobin, red cell count, and red cell volume.

The second group includes those tests of which reliable techniques have been developed, but of which the interpretation of the results is still controversial. To this group belong e.g. the evaluation of the level of protein, minerals and vitamins in the blood, and the measurement of the amount of minerals in bones from X-rays. This group includes also the evaluation of the concentration of certain nutrients in certain body cells, such as the measurement of the content of ascorbic acid in leucocytes (white blood cells) and platelets or the evaluation of the content of total thiamin in leucocytes and platelets. To the same group belong also the various "saturation" tests, such as the evaluation of the amount of thiamin excreted in the urine after a single dose of thiamin has been given orally or parenterally.

The third group includes those tests which appear to be associated with one or more aspects of undernutrition, but about which not only agreement in regard to the technique itself has still to be reached, but about which the definite connection with the nutritional status has yet to be established. To this group belong e.g. the comparison of skeletal X-rays with maturity standards, measurements of dark adaptation, and examination of certain tissues of the body with the biomicroscope.

In evaluating the results of a mass nutrition study, the line of division between those adjudged to be well-nourished and those regarded as malnourished is arbitrary. This line may be placed between those whose deficiencies have reached the stage where they may be detected by clinical examination, and all other people; or it may be allowed to fall between those regarded as optimum in nutritional state and other members of the population. In the Pennsylvania mass nutrition studies, the only persons accepted as being in an optimum group as regards nutritional well-being are those

whose physical state could not be improved further by improvements in nutrient intake, in so far as present knowledge of the subject is concerned.

In the Pennsylvania studies, a total of 2511 subjects was tested between 1935 and the early part of 1941, and 1362 more subjects were examined during the next few months. In addition, certain smaller groups were given special dietary tests for a period of time. This report therefore will be divided into two parts: in Part I, the findings on the first 2511 subjects will be summarized; and in Part II* those on the second group of 1362 will be presented. In the second part of the presentation the number of tests made was considerably extended.

Summary

* With the collaboration of the Department of Pediatrics, School of Medicine University of Pennsylvania, and the Children's Hospital of Philadelphia. This part of the study was under the sponsorship of the Philadelphia Child Health Society.

Introduction

Several investigations were carried on from the early 'twenties until about 1935 involving a study of food habits and physical condition of people as shown chiefly by medical and dental examinations. Examples may be found in published works of Roberts (16) in Kentucky in 1922, of Reynolds (15) in Virginia in 1926, of Davies (4) in Massachusetts in 1928, of Ahmann and Abbott and their collaborators (1) in Florida in 1930, of Frayser and Moser (5) in South Carolina in 1930, of Morey (13) in New York in 1933, of Brown (2) in Utah in 1934, and of Clayton (3) in Maine in 1940. During this period a few somewhat more objective tests were applied to human beings in various localities. These studies were made primarily for the purpose of developing methods of supplementing the physical examination, which, without special equipment, is inclined to be subjective.

Beginning in 1935, a somewhat new approach to the problem of food consumption and consequent nutritional status was made when The Pennsylvania State College began a large-scale mass study on human beings in all socio-economic levels in many representative communities, using a considerable number of objective laboratory tests. Three other nutrition studies of the newer mass type were begun some time thereafter: (a) in New York City, in 1937, in which the United States Public Health Service, the Milbank Memorial Fund, and other co-operating agencies combined to study school children and others in New York City; (b) in Vanderbilt University, about 1938, where the School of Medicine with the aid of the Rockefeller Foundation began the study of a predominantly rural area in Tennessee; and (c) in North Carolina about 1939, by the State Health Department, the Medical School of Duke University, and the Rockefeller Foundation.

From all of these studies, incomplete as they must have been because of a lack of many objective criteria, the conclusion is unquestionable that a large part of the population is undernourished with respect to a considerable number of essential nutrients. In the Tennessee study, for example, 90 per cent. of the population examined up to April, 1939 (512 persons from 129 families), were found to be low in the total energy content of the diet; about 81 per cent. were low in a photometric test designed to measure night blindness—an indication of whether sufficient vitamin A and other nutrients are included in the dietary; about 44 per cent. were either border-line or definitely subnormal in vitamin C status; about 20 per cent. were deficient in protein; a total of 26 per cent. had lower hemoglobin (red coloring matter in the blood) than is deemed desirable, and 44 per cent. had lower red cell counts than the currently accepted minimum standards for a comparable sex and age group, as suggested by Youmans (18).

SUBJECTS OF THE STUDY

In the Pennsylvania mass studies in human nutrition as they were conducted from 1935 through the early part of 1941, the 2511 subjects represented the following groups: A total of 418 of these were members of 100 typical urban families of a broad range of cash income, living in towns and cities of sub-metropolitan size; 490 were members of 100 rural families likewise widely selected as to farm income, representing three major types of farm enterprise; and 1603 were school children in five communities, not members of the two groups of families previously described. The sample of school children was selected within each of the communities in such a way as to be representative of the socio-economic and racial composition of the community as a whole.

More specifically, the subjects may be grouped into the following units:

Family Unit 1. Family Unit 1 included 418 members of 100 urban sub-metropolitan families selected to represent a broad group of income. These were tested from 1935 to 1937. The vitamin A intake and dark adaptation status of these family members have been described by Mack and Sanders (9), and the full report of this unit of the study is in preparation by Sanders and Mack (17).

Family Unit 2.* This includes 490 members of 100 rural families chosen to represent three kinds of farm enterprise—fruit growing, dairy farming combined with general agriculture, and general farming. In each of the three localities, which were typical of these three major types of agricultural enterprise, the families were selected so as to represent as broad a distribution of farm incomes as was characteristic of the communities in which the selections were made. These families were examined from 1937 to 1940.

Child Unit 1. The first child unit in the study embraced the 128 children of grade-school age in Family Unit 1. They have been analyzed as a separate group, as well as with the other members of their families, for comparison with other grade-school children in the study, the rest of whose families was not included. These children have been counted but once in the total of 2511 persons in this part of the report.

Child Unit 2. In Unit 2 among the child groups, 428 children were chiefly from families of industrial workers; only about three per cent. of the families in this city of 82,000 inhabitants had family incomes of more than $2500. At the time of the study in this community, 1936-1937, there was a depression in the chief industry around which the town was built—railroad shops. These children have been reported in detail by Zayaz, Mack, Sprague, and Bauman (19).

* Reported Milbank Memorial Fund, Eighteenth Annual Meeting, April 2, 1940, and published in proceedings of that meeting.

Child Unit 3. This unit was selected in a community in which a college constituted the chief center of activity. The sample included the entire fifth grade of the public school and some of the grade-school children in a college demonstration school during the year when the measurements were made (1937-1938). The children attending the public school came chiefly from families whose fathers were college teachers or research workers, or who were connected with the college in some manner, or who operated stores or boarding houses in the town. Although there were no families in the town with extremely high incomes, on the other hand few families were on relief. The average family educational score of the children in this group was higher than that of any other group in the Pennsylvania mass studies throughout the period covered by this report. The nutritional state of the children in this unit has been described by Mack, Smith, Logan, O'Brien, Stewart and Dodds (12). These included 147 children.

Child Unit 4. In Unit 4 of the child study, the chief community industry was anthracite coal mining. Most of the people in the community had medium incomes, but some incomes were quite high and some quite low. The people in this community likewise represented a broad range of racial and national backgrounds. The population from which the sample of children was drawn numbered 25,000. These children, 813 in number, were studied from 1937 to 1940.

Child Unit 5. In Unit 5 of the child study, the children from Family Unit 2 whose parents were engaged in fruit-growing (34 children of grade-school age) were combined with 27 other rural children from families of similar farm enterprise, in order to compare the growing children from horticulturists' families with those of other rural families, and with different communities of urban children. The children of this unit who were members of some of the families in Family Unit 2 were counted but once in compiling the total number of subjects upon which this part of the report is based.

Child Unit 6. The subjects in Child Unit 6 were the 84 children of grade-school age in the rural families engaged in dairy combined with general farming in Family Unit 2. The land in the community from which this sample was taken was especially rich, and the farms generally had an air of prosperity. As stated, the selection in this community represented the general income range of the region as a whole.

Child Unit 7. The children of Unit 7 were the 50 grade-school-age members of families already described as representing a general farming community. The locality where the sample was taken was an agricultural region where farms were not so prosperous as in Unit 6; general farming on soil of medium to low fertility constituted the chief family occupation.

Those in Units 6 and 7, who were included also in Family Unit 2, came but once in the total count of subjects in this part of the report.

Child Unit 8. The children of Child Unit 8 were not included in the family study. They were 77 in number, and they came from families who were running the crossroads grocery store, helping on farms in the neighborhood, operating or working on small general farms, running a gasoline filling station, or engaging in other miscellaneous occupations in a small rural village and its adjacent countryside. The children were in attendance in the intermediate grades of a consolidated and two nearby one-room rural schools. These children were tested in 1938.

Child Unit 9. In Child Unit 9, the children came from three neighboring one-room schools, in a region of very poor farm land. About one-third of the children in this group were members of poor families living outside of the limits of the nearest town, because of cheaper rent, and were not engaged in agricultural pursuits at all; in fact many were on direct governmental relief. Nevertheless, they went to the rural schools because they did not have the tuition needed for attendance in the town school. None of these children, whether from farms or from the out-of-town poor suburb already described, was in the highest income group of this study. In fact, 73.4 per cent. of them had family incomes below $1000 a year. This unit of the child nutrition study, composed of 111 children, was tested in 1941.

METHODS OF THE TESTS

Dietary Records—In all units of the work, dietary records were supervised by staff members with the assistance of visiting registered nurses, and the nutritional tests were applied during or near the close of the diet-recording period. The methods of diet record-keeping and of measuring nutritional status were those described by Mack and Smith (10).

Tests for Nutritional Status—The following nutrition tests were made on the two family groups:

Accepted Techniques

Medical examination.
Dental examination for caries.
Amount of hemoglobin in the blood.
Red-cell count (beginning in 1937).
Body build measurements.

Accepted Techniques, But Interpretation of Findings Still Controversial

Blood ascorbic acid (beginning in 1939-1940).
Skeletal mineralization.

Figure 1.—In the Pennsylvania studies, a photoelectric microphotometer makes photographic tracings through certain paths in an X-ray (as for example in the path designated in these large heel bones—calcanea), in order to determine the amount of mineral in bones. The tracings may be measured to obtain an accurate value for the amount of mineral in the skeletal area traced.

(A) Direction of microphotometric tracing through the Roentgenogram of the calcaneum of a small child.

(B) Direction of tracing of an adult X-ray film.

Techniques of Which the Connection With Nutritional Status Is Still Controversial

Skeletal maturity (for children only).
Plantar contact.
Dark adaptation.
Capillary wall strength (now obsolete; gave promise of value in nutrition studies before more objective methods were introduced).

Advice of the family physician was taken on medical history, if the family had a physician. Otherwise this was obtained as accurately as possible from the family itself.

The same group of tests has been employed in the child nutrition studies and, in addition, a physical examination by a pediatrician has been made, with a nutritional status score assigned according to a grading plan. A thorough dental examination likewise has been made in the latter series of studies, with a score given on the basis of the prevalence of dental caries. In this test, a perfect score was assigned in cases where no caries was found either by a clinical examination or from a study of dental X-rays. Another arbitrary score was assigned on the basis of the condition of the gums; and a test for the solubilizing effect of fresh saliva on dental enamel ground finely was made on some of the subjects.

Subjects who were known to have a chronic or temporary illness which might interfere with the nutrition tests were not included in the study. Funds were inadequate for medical examinations of the two family units. In Community 2 of the child-nutrition study, each child was given an examination by the school physician, and in the other communities by a pediatrician associated with the study, in order to exclude those whose responses to the nutrition tests might be affected by conditions other than dietary intake, and in order to find clinical evidences of nutritional state.

The methods of making the nutrition tests as applied in this early part of the study have been described in detail by Mack and Smith, in *Methods of Conducting Mass Studies in Human Nutrition*, 1939 edition (10).

The arbitrary classes assigned on the basis of the response to some of the tests have been described by Lowther, Mack, Logan, O'Brien, Smith, Sprague, Shaw, and Dodds (8). Class 1, or the optimum class for the respective tests, includes a range of responses to this test believed by the authors to be achievable by subjects with good dietary histories.

From data of these two basic studies on the 2511 persons mentioned, various comparisons may be made, which indicate trends in nutritional status in different groups of the populations in the study.

FINDINGS OF THE STUDY
FAMILY GROUPS

The results of the analyses of the diet records and of the nutrition tests for the 100 urban and the 100 rural families mentioned in this report will be given in detail by individual cases in forthcoming bulletins of the Ellen H. Richards Institute.

Figure 2 summarizes the nutrition status findings on the urban and rural families.

Economic Status

In Figure 2, it is seen that a broad selection both of urban and of rural children characterized the two family groups. Those marked Group A in the urban family unit had a total family cash income of $5000 a year or above. Group B had an income of $4999 to $2500; Group C from $2499 to $1000; Group D below $1000, but not on direct government relief; and Group E had incomes at least partly from relief. The incomes of the rural families, marked L, M, N, O, and P were comparable with the respective urban series in income; the income grouping in both cases were based upon cash receipts.

The families were selected on the basis of income, and, in the case of the rural groups, also as to type of farm enterprise. Education of the adult family members was not a selection criterion. It is interesting, therefore, to note how the families grouped themselves on this factor. Whereas all adults in 20.1 per cent. of the urban families were college graduates, only 3.3 per cent. of the rural families ranked this high educationally. Considerably more of the rural families, however, were in the second educational group, in which at least one member was a college graduate, with slightly larger percentages in the third and fourth groups (all adults high school graduates, and at least one adult a high school graduate, respectively). The urban exceeded the rural, on the other hand, in the percentage of families in which no member was a high school graduate—53.4 as compared with 30.1 per cent. for the rural families.

Weight Status

In contrast with the urban group, the subjects in the rural unit had fewer cases of underweight, although the mean difference was not highly significant. The Pryor (14) standards, based on sex, age, height, and iliac width, were used for subjects up to 24 years of age, and the medico-actuarial standards for those above that age. The percentages of subjects of the correct weight, according to the standards, were very similar in the two groups—60.0 and 64.0 per cent., respectively, with the percentage of overweight slightly higher for the rural family members.

Skeletal State

The growing children in the rural families were slightly poorer

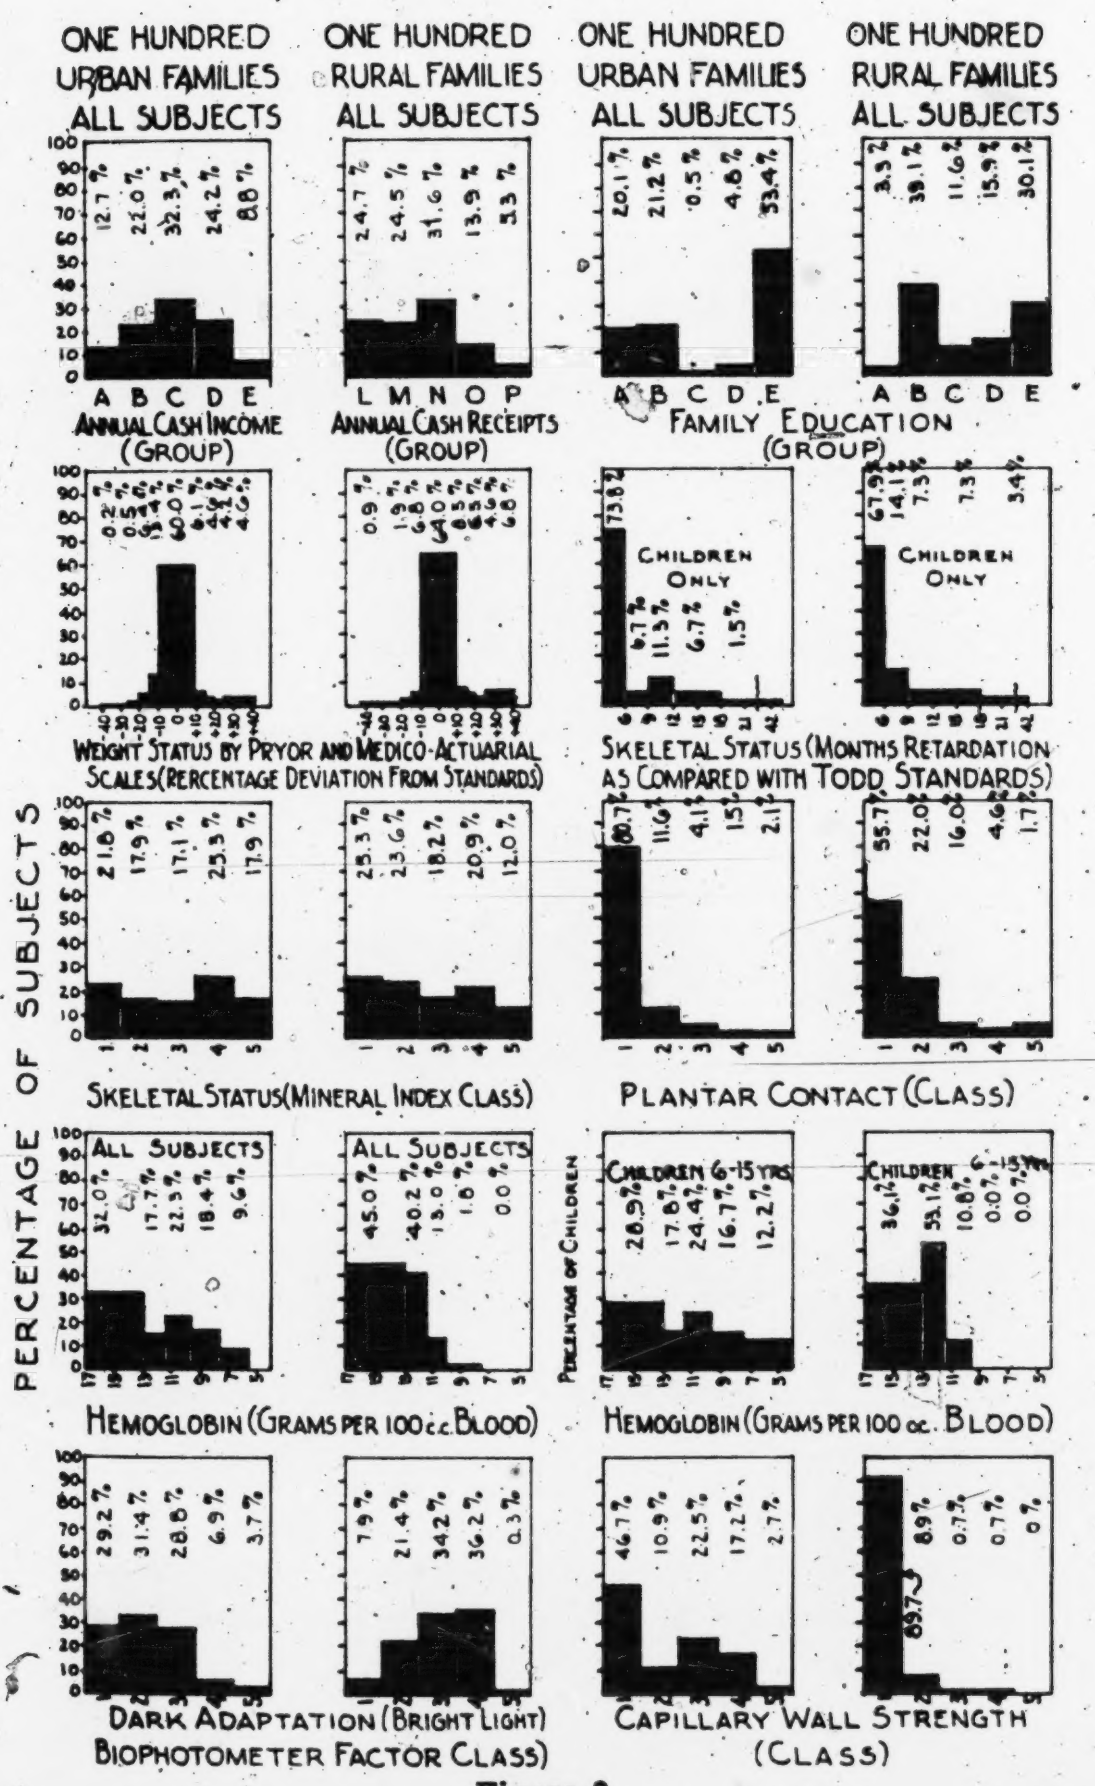

Figure 2

Comparison of Income, Education, and Nutrition Status Findings of Urban and Rural Families.

(Note: The plantar contact and capillary wall strength tests, used in Part I of this study, have been omitted in Part II.)

than the urban children according to the test used for skeletal maturity, which is valuable for comparative purposes only, although the measured degree of skeletal mineralization was slightly better for the former group. The differences between the two groups in these two respects, however, were not notable.

Plantar Contact

A higher percentage of urban family members (80.7 per cent.) than of rural (55.7 per cent.) had excellent arches of the feet, as shown by the ratio of the sitting to the standing plantar contact — a factor which may have some relationship to nutritional state, although no interpretation of the plantar contact findings is attempted.

Hemoglobin Values

When all family members for the two units were grouped together, 45.0 per cent. of the rural in comparison with 32.0 per cent. of the urban had hemoglobin values of 13.0 grams per 100 c.c. of blood, and over. This favorable difference in behalf of the rural families was further substantiated by the fact that no rural subject had a hemoglobin concentration below 7.5 grams per 100 c.c. of blood, whereas 9.6 per cent. of the urban family members were in this low category. When the children of grade-school age were separated from the rest of the family, the hemoglobin values were seen to be distinctly higher for the rural than for the urban children. A comparison of the hemoglobin values for these two groups of families has been given in detail by Mack, Smith, Logan, O'Brien, Shaw, and Dodds (11).

Red Cell Counts

Red cell counts were made on the blood of the rural family members only, with 41.24 per cent. having 4.76 million per 100 c. mm. and over; 19.02 per cent. from 4.75 to 4.51; 19.87 from 4.50 to 4.26; 11.11 per cent. from 4.25 to 4.01; and 8.76 per cent. having 4.00 and below.

Dark Adaptation

Much controversy exists as to the proper interpretation of findings with the dark adaptation test. In the Pennsylvania mass studies, the biophotometric test has been given in a highly standardized manner, and the instruments used have been calibrated with great care, at frequent intervals by optical engineers. If the vitamin A in the diet is at least one of the factors operative in determining dark adaptation, it is interesting to consider why the responses to this test by the rural subjects were generally poorer than those of the urban subjects.

Although the diets of the rural people were not so good in vitamin A content as would be expected, their responses to this test were poorer on a dietary intake basis than was the case with the urban groups of families. It is possible that their greater length of time

in the sun may have made greater demands upon their vitamin A reserves, because of the more extensive bleaching of visual purple—the phototropic substance in the retina of the eye which depends for its manufacture upon the intake of vitamin A. It is possible, also, that other factors in the dietary may have been inadequate to the extent that they interfered with dark adaptation. See Part II.

Capillary Wall Strength Not a Specific Test

It has long been known that capillary wall strength was not a specific test for undernutrition with respect to vitamin C or any other single nutrient. In fact, when these studies had been in progress only a short time, in 1935, it was concluded from observations in this laboratory, as well as from those of other investigators, that low response to this test was associated with multiple deficiencies rather than with a shortage of any one nutrient factor. The test was continued in this laboratory until 1941, however, in order to ascertain what interrelationships between response to this test and diet might exist. These results are soon to be published.

In the two family groups under discussion, it is striking to note the high capillary wall strength values of the rural family members, with the urban group falling somewhat lower in this respect. The values for the five respective groups in this case are the following: Class 1, no capillary break up to 60 cm. of negative pressure with the Dalldorf resistometer; Classes 2 to 5, breaks of greater intensity according to the definitions of Logan (7) at progressively lower negative pressures.

General

Among the rural families of the three localities included in the first 100-family rural unit, those in the generally less prosperous farming community were not so high in their classification in some of the tests as were those in the locality where dairy farming coupled with general farming was conducted with relatively high annual farm cash incomes. In other tests, there were no significant differences between the two. With only a few exceptions, the responses to the nutrition tests of families in the fruit-growing region were little different from those of comparable socio-economic status in the urban centers.

Comparison of Diets

Detailed analyses of the diets of the two groups of families will be given in forthcoming publications, as has been stated. Some of the outstanding results of the nutrition tests, however, will be related to diets very briefly in this report.

The relatively higher hemoglobin content of the blood of members of the rural families, particularly of young children, may be explained by higher consumption of iron and protein containing foods, espe-

cially a higher intake of meat. A tendency for children to begin at an early age to simulate the diets of older members of the family undoubtedly resulted in their higher status with respect to this factor.

A smaller utilization of milk and eggs, and in some cases even of some types of vegetables by many of the rural families, than would have been anticipated may have been associated with a low average response to the dark adaptation test. Moreover, there was a definite indication in the study that more vitamin A was needed by some of the rural people than by urban people, since responses to the dark adaptation test were not so good on the average by rural as by urban people of similar vitamin A intakes. This might have resulted from the greater exposure to sunlight of the rural subject, as has been noted.

The fact that skeletal status was no higher on the average in the rural than in the urban subjects appears to be related to the fact that the total amounts of the various nutrients were no higher in the main for the rural than for the urban families. This was related at least in part to the tendency for some rural children to imitate their elders in their food consumption habits, which, in the case of meat, resulted in increased consumption at an early age and consequent higher hemoglobin status; but in the case of milk, the consumption by many rural children was smaller than is desirable. This probably accounts, at least to some degree, for the fact that skeletal status in rural was no higher than in urban children.

CHILD GROUPS

The findings with respect to the nine groups of grade-school children are presented very succinctly in Figure 3. The different results may be summarized briefly as follows:

Family Income

In Figure 3, the incomes marked 1, 2, 3, 4, and 5 refer to the groups already described, in the same descending order as in the family units, in which letter rather than numerical designations were used.

In Child Unit 1, composed of the children of grade-school age in Family Group 1, a somewhat normal distribution with respect to cash income is seen. This is reasonable since the group of urban families from which these children came was chosen to represent a broad range of incomes. In the case of all of the other child units, the children were selected to represent a certain community, and hence the incomes characteristic of the community are found.

In Child Unit 2, a small industrial city of long-time depression, few incomes above $5000 a year were represented, with the greater number of incomes—as in that community as a whole—falling between $2500 and $1000, and below $1000 a year.

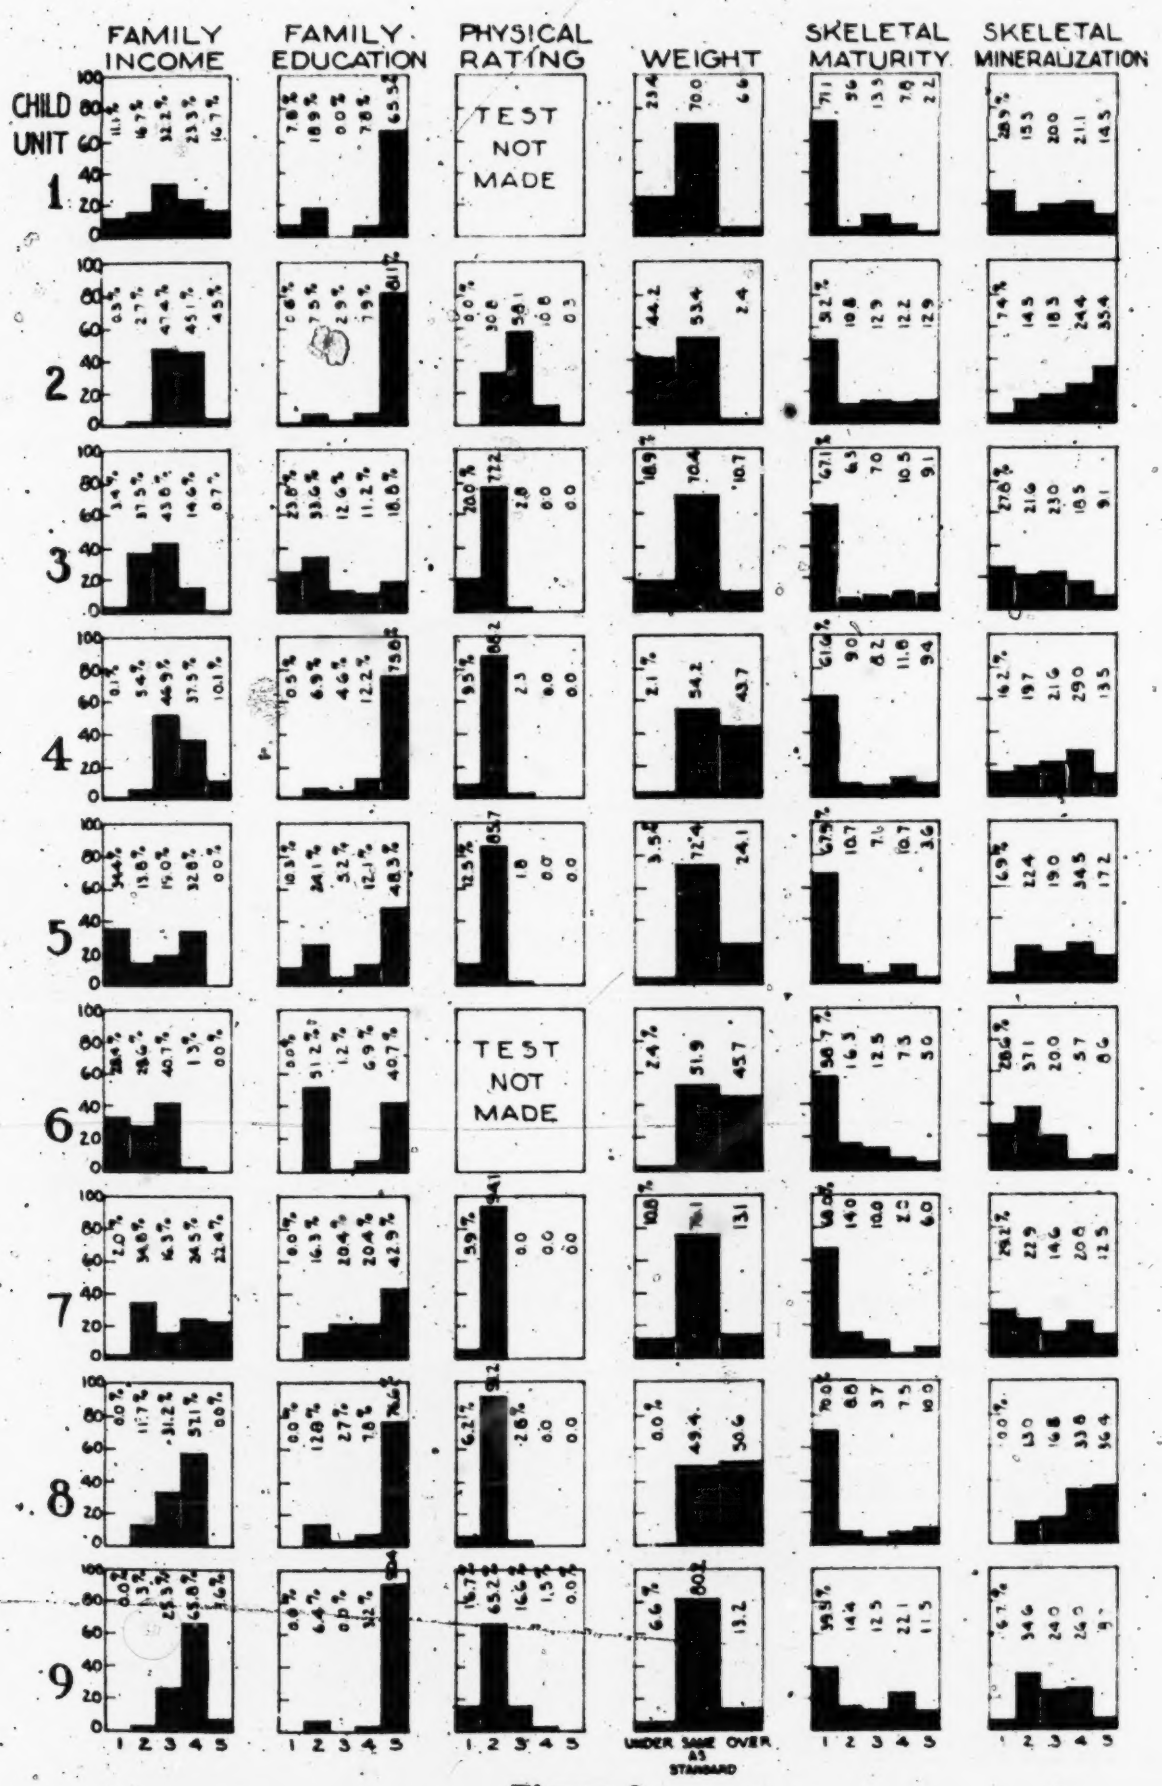

Figure 3

Distribution of the nine groups of grade-school children as to socio-economic status, physical rating by a pediatrician, weight, and skeletal status. See pages 17 and 18 for explanation of reason for such tests as plantar contact and capillary wall strength.

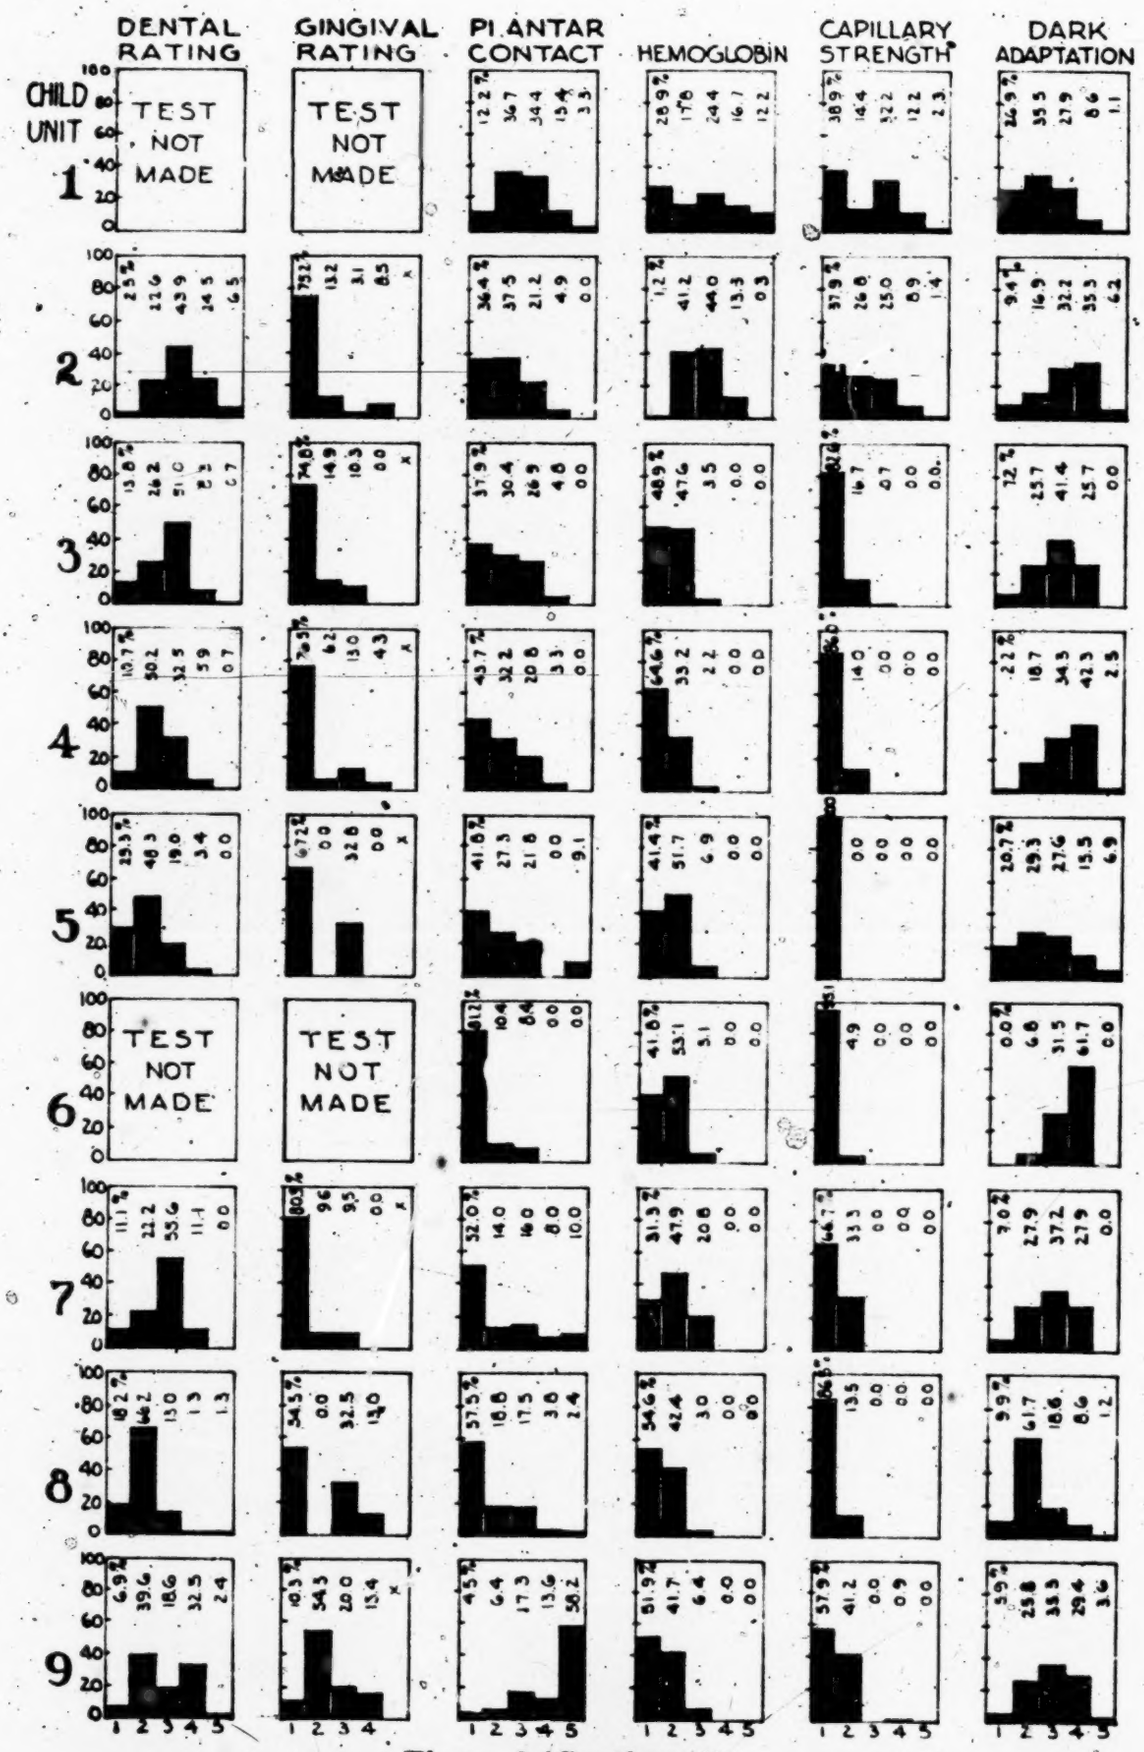

Figure 3 (Continued)

Distribution of the nine groups of grade-school children as to dental, gingival (gum), plantar contact, hemoglobin, capillary wall strength, and dark adaptation ratings. (Note: The plantar contact and capillary wall strength tests, used in Part I of this study, have been omitted in Part II.)

The family incomes of the children in Child Unit 3, living in the college community, were few at the two extremes, and highest in the second and third groups.

The family incomes of the children in the anthracite community (Child Unit 4) were slightly higher than those in the former industrial city (Child Unit 2), but were considerably lower than those in the college community.

The children of the horticultural farm families (Child Unit 5) and of the families engaged in dairy and general farming (Child Unit 6) were the highest in income, in general, of any of the groups.

The children belonging to the agricultural families engaged in general farming in a region in which the land was not especially good (Child Unit 7) had but a small percentage in the highest income group, with the rest of the cases scattered broadly through the remaining arbitrary income groups.

In Child Unit 8, selected from one consolidated and two neighboring one-room rural schools, there were no children either in the highest or the lowest income groups; the percentages in the three intermediate groups became greater as incomes declined.

In Child Unit 9, composed of children of low socio-economic status in three neighboring one-room rural schools, incomes were still further askew toward the lower side, as may be seen in the figure under discussion (Figure 3).

Family Education

Except in the cases of Child Unit 3 (college community), Child Unit 5 (children of fruit-growing families), and Child Unit 6 (children of dairy and general farmers), the percentage of families was greater in the lower groups, as based on the education of adult members, and was smaller in the higher education groups.

Rating for Nutritional Status by Medical Examination

The children ranking generally lowest in nutritional status as rated by an examining physician were those in the groups of lowest socio-economic status, as may be seen in Figure 3. It is striking, however, that such a relatively small percentage of the children was to be found in the highest arbitrary group, even in the economically more favored child units. The physical examination score is based on the general appearance of nutritional well-being, as judged by a skilled pediatrician, and is determined by such points as skeletal state, musculature, condition of the skin and of the mucous membranes, sub-cutaneous tissue, pallor, and other factors pertaining to general nutritional state which may be observed during a clinical examination. This indicates a point which is borne out in the more objective tests; namely, that children in all socio-economic groups

are below optimum, in the main, in over-all nutritional state, with the percentage of those showing undernutrition in the various respects which are now observable or measurable increasing as incomes and family educational state decrease.

Weight Status

The greatest percentage of underweight was found in Child Unit 2, with higher percentages of underweight in Units 1, 3, 7, and 9, than in 4, 5, 6, and 8. The less depressed industrial and the more prosperous rural communities, and the small rural village, therefore, had less underweight, proportionately, than the college community, the poorer general farming community, and the most depressed rural community, a goodly number of which—in the latter case—was not engaged in agriculture, but was only living outside the nearest town limits to find cheaper living quarters.

Skeletal Status

Skeletal maturity is seen to be lowest for Child Unit 9 (the lowest income rural community) and next lowest for Child Unit 2, the most depressed industrial community. The other communities were not notably different from each other in this respect. It might be noted in passing, however, that the urban child groups in areas not suffering from long-time depression (Child Units 1 and 3) were equal or superior to most of the rural groups. Skeletal maturity, as has been noted, is a comparative test only.

In skeletal mineralization, the results are different for each of the units, with Child Units 1, 3, 6, and 7 being higher than the other groups. This measurement is made by ascertaining the amount of mineral in the bones indirectly from X-rays, using a photoelectric microphotometer for making objective measurements of this factor. Although standards have not been set for the desirable amount of mineral in the bones of growing children of grade-school age, it may be assumed that children with a higher degree of mineralization are better nourished than others of a similar age group with less dense skeletal mineralization.

Dental Status

The children in Units 1 and 6 were not given a dental examination because a limited budget precluded the employment of a doctor of dental surgery at the time when these two groups were tested. With respect to the other groups, it is seen that few children were to be found in the highest arbitrary class—that in which no dental caries or only a small degree of dental caries was found.

In Child Unit 2, the most depressed industrial community, for example, only 2.5 per cent. of the children fell in this highest classification, with only two children in this community group found to be

free from dental caries altogether. These were respectively a 13-year-old boy and a 12-year-old girl.

In Child Unit 3, the college community, 13.8 per cent. of the children were rated in Class 1 in this respect, but none of the children in this class was absolutely free from dental caries.

In Child Unit 4, selected from a somewhat more prosperous industrial community, 10.7 per cent. of the children were in the highest class, with five of these children having their permanent teeth free from all evidences of present or past caries.

In Child Unit 5 (a rural unit made up of children whose parents were fruit growers), 29.3 per cent. were in the highest dental rating class, but none of the children within this class was completely free from dental caries.

In Child Unit 7, the rural group of children whose parents were general farmers, 11.1 per cent. were in Class 1 on the basis of their dental caries rating, with no children in this group completely free from caries.

In Child Unit 8, made up of children in an agricultural region attending the middle grades of a consolidated and two one-room schools, 18.2 per cent. were in Class 1 on the basis of dental status, with none of the children perfect with respect to absence of caries.

In Child Unit 9, the most depressed rural community, 6.9 per cent. of the subjects were in Class 1 on the basis of dental status, with one child only perfect with respect to absence of dental caries.

To summarize the dental status in so far as caries are concerned, eight children past the deciduous tooth stage, only, were found with teeth free from dental caries—one of the most universal nutritional disorders—a deficiency the etiology of which has not yet been fully ascertained.

With respect to the condition of the tissues of the gums, the figure under discussion will show a wide difference among the various child units. Child Unit 7, for example, had 80.9 per cent. of the children rated by the examining doctor of dental surgery as normal with respect to the absence of visible gingival lesions or inflammation. In Community 9, on the other hand, only 10.3 per cent. of the children were so rated, with the remaining groups intermediate between these extremes.

In the figure, the three classes which follow Class 1 are these: Class 2 represents slight inflammation, Class 3 somewhat more distinct inflammation, and Class 4 severe inflammation of the gingiva. The ratings were done by visual inspection and were arbitrary. Only one doctor of dental surgery made the examinations throughout the study, however, and an attempt was made by him to standardize the use of the four category definitions. These findings are based upon the

opinions of a doctor of dental surgery who examined the subjects, and hence are arbitrary, as mentioned.

Plantar Contact

It has not been established what relationship, if any, exists between flat feet in children and dietary deficiencies. It is believed by some who deal with the nutrition of children that a relationship exists between these factors, although objective data have not yet been presented to show wherein the relationship may lie. Without regard for nutrition implications, the data on plantar contact in this paper are presented in order to show the comparison between the various groups of children in this respect.

The highest rating group with respect to this factor was Child Unit 6, in which 81.2 per cent. of the children had virtually no change between the percentage of plantar contact while standing and that while sitting. The lowest group was Child Unit 9, in which only 4.5 per cent. of the children fell in this highest plantar contact classification. It is interesting to know that this lowest group was an extremely depressed economic group. This same comparison does not pertain throughout the remaining groups, since some of the high and some of the low Child Units economically are similar in this particular respect.

Hemoglobin Status

The hemoglobin values for the nine respective Child Units are interesting in that there is no apparent relationship between hemoglobin status and socio-economic status. The urban community of lowest incomes is an apparent exception in that only 1.2 per cent. of the children are in the highest arbitrary hemoglobin classification in this particular sample. Whereas, in the case of the urban and rural families, there was a distinct difference in hemoglobin status in favor of the families living on farms, that distinction does not hold throughout all of the child groups. The children in the preferred industrial community are higher than some of the rural units.

An explanation of the comparatively high percentage of children in Child Unit 9—the depressed rural group—who were in the two highest hemoglobin groups may be found in the fact that the results shown in the figure were obtained in the early fall, while gardens—which most of the families maintained—were still yielding leafy vegetables. These same children were in a longitudinal study which ran concurrently with the mass studies. In March, their percentages in the respective hemoglobin groups were as follows: Group (1) 0.9 per cent; Group (2) 7.5 per cent; Group (3) 36.4 per cent; Group (4) 55.2 per cent; and Group (5) none.

Capillary Wall Strength

The most noteworthy finding with respect to capillary wall

strength was the fact that some urban groups were distinctly lower than the rural in this respect although there were exceptions, notably the depressed rural sample—Child Unit 9.

Blood Plasma Ascorbic Acid

Child Unit 9 only received the blood plasma ascorbic acid test, with 6.45 per cent. having 50 mg. per 100 c.c. of blood and below, and 19.34 per cent. 60 mg. and below.

Dark Adaptation

The best Child Unit with respect to dark adaptation was Child Unit 1, with none of the groups particularly high in this regard.

Clinical Evidences of Undernutrition

In the early part of the study, as noted previously in this report, a medical examiner was not attached to the Pennsylvania mass studies in human nutrition because of financial limitations. Beginning in the latter part of 1936, however, a part-time pediatrician was employed, and the medical records were kept uniformly from that time on.

With respect to the children covered after that date, a brief summary of the more outstanding clinical findings in so far as they may relate to nutrition is as follows:

Ear discharges and other ear disorders of a possible nutritional origin were found in 5.9 per cent. of the children examined, irrespective of the community.

Heart irregularities were found in 11.5 per cent.

Evidences of past minor rickets were found in 11.1 per cent. and of past major rickets, such as rachitic rosary and excessively bowed legs, were found in 2.1 per cent.

Poor reflexes were found in 6.6 per cent. of the children receiving the medical examination. This may or may not be associated with undernutrition.

Of all of the subjects studied, only two boys—brothers of junior high school age—were free from dental caries, and were uniformly high in all of the tests given to them.

SUMMARY

This is a report of the dietary habits and state of 2511 urban and rural subjects, comprising two family and nine child groups, representing a broad range of incomes.

DEFENDENT'S EXHIBIT 18 (1219)

Malnutrition Affects 999 Persons out of 1000!

Deficiencies in minerals and vitamins almost universal

ONLY 2 PERSONS IN 2,511 HAVE PERFECT DIET

Malnutrition Near Universal, Six Year Survey Indicates

By HOWARD W. BLAKESLEE
Wide World Science Editor

STATE COLLEGE, PENN. — Only one person in a thousand escapes malnutrition — that is the conclusion of a survey published today by the Ellen H. Richards institute at Pennsylvania State college.

The survey took six years, and is one of the most thorough ever made. It included both adults and children. The report is made in the college's chemistry bulletin, by Dr. Pauline Beery Mack, director of the institute, and her associates.

• • •

The study covered 2,511 Pennsylvanians. Just two rated high in all tests. All others showed deficiencies, the poor worse off than the rich, but both classes below the best rating.

Only eight were free of tooth decay, a trouble ascribed partly to deficient diet.

The majority were deficient not just in one nutrition test, but in several. The survey indicated that if one diet deficiency exists, other essentials are likely to be low.

There were many long-time lacks of adequate vitamins, proteins and minerals. Weight of 17 per cent of persons studied was under par. Sixty per cent of growing children were more than six months retarded in skeletal growth.

The bones of a large majority, both adult and children, were not satisfactorily mineralized.

• • •

Bone defects are linked with deficiencies in proteins, calcium, phosphorus, Vitamin D and other vitamins and minerals.

More than half were below the desirable standard in hemoglobin, or red blood content. This is evidence of under par protein and iron intake. Many were low in Vitamin A ratings.

"These findings," said the report, "suggest conditions which may be expected to prevail in other states, many of them less prosperous than Pennsylvania."

In one city where depression had been acute, one child out of every three examined gave evidence of having had rickets, an under-nutrition bone trouble.

Twenty-five per cent had gingivitis, inflammation of the gums, which is a forerunner of scurvy due to lack of Vitamin C. More than half had iron and protein deficiencies, which resulted in anemia.

• • •

Only 7.1 per cent of these children had good Vitamin A ratings.

In all communities, regardless of economic status, the average diets of the children were far below the daily intake levels of protein, vitamins and minerals recommended by the National Research council. The adult diets were no better than the children's.

Most of the people in the study were not aware of any actual illness due to food deficiencies.

• • •

"The borderline deficiencies," said the report, "are nevertheless serious because prolonged deficiencies build up into major disorders in later years. As science applies more refined methods for detecting obscure signs of deficiencies, it becomes apparent under-nutrition in some degree is almost universal."

Only 2 rated high

Survey took six years

More than half had anemia

Hemoglobin below standard

With one diet deficiency — other essentials low

Children retarded in skeletal growth

Bone defects linked to mineral deficiency

Diets below National Research recommendations

Deficiencies build into major disorders

Under-nutrition in some degree is almost universal

SUMMARY

The data available from physical examinations of prospective inductees into the armed services of the United States constitute the greatest volume of reliable information concerning physical defects ever assembled for any large population group. While the primary purpose of obtaining this information is to determine the acceptability of men for service, it has great value both from the standpoint of medical research and public health programs. Only two previous reports on the results of these examinations have been published, both of which were based upon samples drawn from the reports of physical examinations made prior to September 1941. 1/ As is well known, the Selective Service System was not called on to furnish great numbers of men until after the entry of the United States into World War II on December 7, 1941. Between that time and December 31, 1943 the System, operating through 6,443 local boards, selected approximately 10,000,000 men for physical examination by local board examiners, armed forces' induction stations, or both. Of these about 3,600,000 were rejected and nearly 6,400,000 were found physically fit and were accepted for service in the Army, Navy, Marine Corps, and Coast Guard. In addition, 2,700,000 registrants and non-registrants voluntarily enlisted in the armed forces.

This report deals with the results of the physical examinations of over 9,000,000 men examined between April 1942 and December 1943. The study is based on a sample consisting of approximately 20 percent of these examinations.

During the period covered by the study rejections ranged from 31.4 percent for the month of January 1943 to 46.9 percent for December 1943. White rates were consistently lower than Negro rates throughout the whole period. The lowest Negro monthly rejection rate was 51.2 percent while the highest for whites was 42.9 percent. These racial differences held for each age group examined.

Rejections increased in direct relation to increasing age and from the middle 30's on reached over 50 percent of all registrants examined.

Wide variations in rejection rates were found for the various occupational groups. The highest rates were for domestic service workers, emergency workers and the unemployed, and farmers and farm managers. Students had the lowest rejection rates. Negroes had higher rejection rates

1/ Analysis of Reports of Physical Examination: Summary of Data from 19,923 Reports of Physical Examinations. Medical Statistics Bulletin No. 1, National Headquarters Selective Service System, Washington, D. C. November 10, 1941; and Causes of Rejection and Incidence of Defects: Local Board Examinations of Selective Service Registrants in Peacetime. Medical Statistics Bulletin No. 2, National Headquarters, Selective Service System, Washington, D. C., August 1, 1943.

1257

than whites in all occupational groups with the exception of domestic service workers.

The principal causes for rejection for white registrants examined during the entire period were (in order of magnitude): mental disease, musculoskeletal defects, cardiovascular defects, educational and mental deficiency, eye defects, hernia, neurological defects, ear defects, tuberculosis, and syphilis. For the Negroes, the major causes for rejection were: educational and mental deficiency, syphilis, mental disease, cardiovascular defects, musculoskeletal defects, hernia, eye defects, neurological disorders, gonorrhea and other venereal diseases, and defects of the feet.

Of the registrants examined 36.9 percent were reported to be free of physical defects. For the white group the percentage was 38.0 and for the Negroes 30.5. As age increased the proportion with "No Defects" decreased.

The most frequently recorded defects, not necessarily causes for rejection, for the whites were (in order of magnitude): eye defects, defects of the teeth, musculoskeletal defects, mental disease, underweight and overweight, defects of the feet, hernia, cardiovascular defects, ear defects, and educational and mental deficiency. For Negroes the most common defects were: syphilis, educational and mental deficiency, eye defects, musculoskeletal defects, cardiovascular defects, defects of the feet, mental disease, defects of the teeth, hernia, and underweight and overweight.

Rejection rates varied considerably between and within regions. The highest rejection rates were found in the south while the lowest rates were found in states in the northwest.

The leading causes for rejection varied from state to state and between regions. In the south the rejection rates were above the national average for educational deficiency and syphilis. In the eastern region cardiovascular defects were above the national average. Defects of the eyes and ears were more common than in the other regions. In the midwest, rejections for hernia were above the national average. Mental deficiency, dental defects, and defects of the abdominal viscera were also important causes for rejection in this region. In the far west rejections were above the national average for musculoskeletal defects, hernia, eye defects, and syphilis.

BACKGROUND OF THE DATA

The purpose of this study is to set forth in some detail the results of the physical examinations of over 9,000,000 men examined between April 1942 and December 1943. The study is based on approximately a 20 percent sample of the total physical examinations given in this period. The major factors considered are: (1) rejection rates by race, age groups, and occupation; (2) the principal causes for rejection, by race and age groups; (3) the incidence of all recorded defects, by race; and, (4) state and regional differences in results of physical examination.

The Selective Service System is charged with the difficult task of providing men for the armed forces without seriously interfering with the production of military supplies, essential civilian goods, and necessary agricultural products. Since the demands for men for the armed forces and essential production cannot be predicted with accuracy for long periods of time, because both are dependent on unknown factors influencing the course of the War, the policies of the Selective Service System and of the armed forces must be revised from time to time to meet the needs of the military situation. The changes in policy having greatest influence on the data of this study are those dealing with: (1) the selection by the Selective Service System of registrants for physical examination; (2) the standards set by the military authorities covering the physical examination procedure. The latter are to be found in the War Department Mobilization Regulations 1-9; the former are described in the following paragraphs.

Selection for Physical Examination. The selection of registrants for physical examination is the final step in a long process of selection which has been developed by the Selective Service System. Before a registrant is physically examined several factors are reviewed in detail to determine whether he is deferrable by reason of age, dependency, occupation, as an alien, or for other administratively or legally determined reasons. If in the opinion of the local board he is not eligible for a deferrable classification on any of these grounds, he is ordered to report for a physical examination. As a result of this selective process, 37.5 percent of the registrants 18-37 years of age had been deferred for other than physical reasons on January 1, 1944; 57.0 percent had been physically examined and accepted or rejected for military service. The remaining 5.5 percent were awaiting either physical examination or induction. Because of the operation of this selection policy the data available for this study are limited to the records of the group which was selected for physical examination and therefore may not be representative of the total male population eligible for service.

The problem is further complicated by the fact that a number of specific changes in policy which were made during the period covered by the study affected selection for examination. These changes in policy have influenced the pool of registrants available for induction. Certain policies have tended to increase and others to decrease this pool. These are briefly discussed below.

Factors Increasing the Pool of Registrants Available for Examination. Under the regulations in effect in February 1942 only registrants 21-35 years of age were subject to physical examination and induction. The declaration of war resulted in an immediate movement to increase the number of registrants liable for military service and in February 1942 the regulations were changed to include all registrants 20-44 years of age in the group subject to military service. Even registrants 45-64 years of age had been required to register, but there was no prospect of using these men for military service. In November 1942 the age group was further expanded by the inclusion of youths 18-19 years of age.

In December 1942 voluntary enlistment as a means of entering service was abolished for the age group 18-37 years of age. This was done to tighten controls over withdrawals from industry. It is of importance for this report because it assured inclusion of all 1943 physical examinations in the tabulations; whereas prior to December 1942 a varying proportion of the examinations for volunteers was made at recruiting stations. Consequently many of the earlier examinations are not represented in the tabulations.

The third factor tending to increase the pool of manpower available for examination was the reduction in standards, notably those concerning educational deficiency, syphilis, uncomplicated gonorrhea, and the morally unfit. The decision to induct men for limited service was also, in effect, a reduction in physical standards. 1/

1/ (a) Beginning August 1, 1942 the Army accepted educationally deficient registrants on a quota basis. After June 1, 1943, educational deficiency alone was not a cause for rejection.
(b) Registrants were inducted for limited service beginning July 15, 1942.
(c) Beginning October 1, 1942 the Army accepted on a quota basis, registrants with uncomplicated gonorrhea. The quota restriction was removed on February 1, 1943.
(d) On November 7, 1942 moral standards were relaxed permitting the induction of some registrants who were formerly considered unfit for service.
(e) Registrants with uncomplicated syphilis became acceptable in February 1943.

A final factor tending to augment the available pool of manpower was the changes in Selective Service deferment policies, particularly with reference to the curtailment of dependency deferments. 1/

Factors Decreasing the Pool of Registrants Available for Examination. On the other hand, four important factors operated in the direction of reducing manpower available for examination and induction. First, the armed forces' recognition that this is a young man's war resulted in the Presidential Order of December 1942 to withhold men over 37 years of age from induction. A second factor was the induction of increasing numbers of registrants in response to heavy calls by the armed forces for men. Thirdly, there was a rapid growth in deferments of essential workers for agriculture and industry. Finally, there was the prohibition until October 1, 1943 on the induction of pre-Pearl Harbor fathers on a nationwide basis.

These changes in policy resulted in considerable variation in the types of men examined from month to month. Further, those examined in 1942 varied somewhat from those examined in 1943. This was the result of the many important policy changes which were made at the end of 1942. The entire period is definitely weighted in terms of younger men, non-fathers, and occupations least essential to the war effort. The recognition of these factors permits refined interpretations of the data and does not seriously limit their use.

Physical Examination Procedure. During the period covered by this study, the procedure for physical examination consisted of a screening type of examination given by the local board physician, followed by a more complete examination at the induction station. 2/ In this program the function of the local board examining physician was twofold: (1) to secure a blood sample for the serological test for syphilis, and (2) to eliminate those registrants with manifestly disqualifying defects. 3/ The diagnosis of any defect in the List of Defects (Form 220) at the time of the local board "screening examination" was sufficient justification for disqualification and usually resulted in the registrant's reclassification into Class IV-F. Registrants who were not rejected at this examination were normally forwarded to the armed forces induction stations for a complete physical

1/ Class III-B was eliminated on April 12, 1943 and Class III-A was eliminated on December 11, 1943.

2/ Previously the local board examining physician had made a complete physical examination.

3/ The local board physician's guide in this screening examination was the List of Defects, Form 220 (originally issued December 31, 1941) and revised as of August 15, 1942 and January 16, 1943.

examination in accordance with the "Standards of Physical Examination During Mobilization" (MR 1-9, War Department). 1/ Thus the final decision as to a registrant's physical acceptability was left in the great majority of cases to the induction station physicians.

The physical examination at the armed forces induction station was carried on by means of "the assembly line technique". The physicians were of two types: (a) commissioned personnel of the armed forces and (b) civilian physicians whose services were contracted for through the War Department. In addition, non-commissioned personnel and civilians were used as technical assistants and clerks. Practically all physicians were specialists and were assigned to make that part of the total physical examination falling within their field of specialization. A medical work sheet was prepared for each registrant by non-commissioned or clerical personnel. Entries were recorded on this work sheet by each examiner. The chief medical officer then evaluated the findings and determined whether the registrant was acceptable for military service. The "Report of Physical Examination and Induction" (Form 221) was prepared from the medical work sheet by non-commissioned or clerical personnel of the induction station and signed by the chief medical officer or his designated representative. 2/

1/ Revised October 15, 1942 and January 22, 1943.
2/ A sample copy of Form 221 and additional details of the actual methods used in processing these data will be found in Appendix A.

REJECTION RATES

As is well known, a large portion of the men given physical examinations under the Selective Service Act have been found unfit for military service due to physical defects. While the standards maintained by the military forces have been admittedly high, the prevalence of disqualifying defects has become a matter of national concern not only from the viewpoint of the armed forces but from the standpoint of national health as well. In this section of the report the rejection rates are analyzed according to time periods, race, age, and occupational groups.

Table 1 shows that, before Pearl Harbor, when the physical standards were at their highest level, 52.8 percent of all men examined were rejected as unfit for military service. From July 1942 through December 1943, the monthly rejections ranged from 33.1 to 46.2 percent of all registrants examined. 1/ The lowest rejection rate of 33.1 percent in the period January-March 1943 was probably due to the lower medical standards then in force and to an amendment to the Selective Service Act extending compulsory military service to include 18 and 19 year old registrants. 2/ The higher rejection rates for April-December 1943, averaging approximately 44 percent, can be attributed to the operation of several factors. First, a depletion of physically fit manpower resulted from a continual draining off of those registrants qualified for induction. Second, it was a time of considerable reprocessing of previously examined and rejected registrants. Third, the average age of examined registrants was gradually increasing.

Negro rejection rates were consistently higher than those for white registrants. During 1942-1943 the combined local board and induction station rejection rate for Negroes was approximately one and one-half times the rate for white registrants. At the same time, it is interesting to note that the Negro rates as shown in the last column of Table 1 varied proportionately less than the white rates shown in the adjacent column. Negro rejection rates ranged less than 9 percentage points between 1940 and the end of 1943, whereas the white rates varied 22 percentage points from the highest to the lowest rate in that period. This lack of consistency in rejection rate trends for white and Negro registrants is unexpected since the changes in standards should have been reflected in both races. The modification of the standards

1/ Local board and induction station rejection rates for individual months are shown in Table 1, Appendix C. The number of registrants examined and rejected at induction stations from July 1942-December 31, 1943 are shown in Table 2, Appendix C. The method of determining the combined local board and induction station rejection rate is given in Appendix C.

2/ The amendment was in effect in November 1942, but registrants of these ages were not forwarded in large numbers until January-March 1943.

on syphilis, gonorrhea, and illiteracy should have advantageously affected the Negro rejection rates because of the high prevalence of those defects among that race. However, the rejection rate for Negroes has never fallen below 50 percent in Selective Service experience. The modification of standards and even the inclusion of 18-19 year old registrants did not lower the rejection rates among Negroes.

Table 1
Local Board and Induction Station Rejection Rates
per 100 Registrants Examined, by Race
November 1940-December 1945

Time Period	Local Board			Induction Station			Local Board and Induction Station		
	Total	White 1/	Negro	Total	White 1/	Negro	Total	White 1/	Negro
November 1940-September 1941	45.8	43.3	47.2	16.0	15.1	23.1	52.8	51.9	59.4
July-September 1942 2/	10.8	10.0	18.5	33.0	31.0	45.0	40.3	37.9	55.2
October-December 1942 2/	8.2	5.9	19.3	33.1	31.8	41.0	38.6	35.8	52.4
January-March 1943	6.6	5.2	14.6	28.4	26.3	44.4	33.1	30.1	52.5
April-June 1943	6.7	5.8	11.4	37.3	34.7	52.8	41.3	38.3	58.2
July-September 1943	6.1	5.4	8.9	40.4	36.8	56.9	44.0	40.2	60.7
October-December 1943 3/	5.6	5.1	7.3	43.0	39.3	57.3	46.2	42.4	60.7

1/ Includes all races other than Negro.
2/ Race breakdown of local board rejection rates is estimated.
3/ Local board rejection rates are estimated.

Table 2 presents rejection rates by age, race, and place of rejection for the period between September 1942 and June 1943. During this period the white rejection rate was 33.6 percent and the Negro rate 52.9 percent. An inspection of the table indicates that Negro rejection rates were higher than those for white registrants in each age group from 18 through 46 years of age. The difference between the rejection rates for the two races was great at age 18, diminished somewhat between 19 and 23, generally increased from 24 through 28 and again declined from 28 through 45.

There are other interesting regularities in Table 2. (a) The total white rejection rate (local board and induction station combined) was nearly three times as great for age 45 as for age 20. (b) The local board Negro rate likewise tripled in size between those ages, but the induction station rejection rate for Negroes less than doubled, as did the combined Negro rate. (c) The difference between Negro and white local board rejection rates increased with age, but the difference between their induction station rates increased for men in their 20's but decreased in the 30's and 40's. It should be remembered that local board rejections were for obvious defects and for syphilis in contrast to the general causes judged at the induction station.

Table 2
Local Board and Induction Station Rejection Rates per 100 Registrants Examined, by Year of Birth and Race
September 1942-June 1943

Age in 1943	Year of Birth	Local Board			Induction Station			Local Board and Induction Station		
		Total	White 1/	Negro	Total	White 1/	Negro	Total	White 1/	Negro

45	1898	15.0	12.9	27.7	60.3	59.1	68.8	66.3	64.4	77.4
46	1897	18.5	15.5	36.4	60.1	58.8	69.9	67.5	65.2	80.8

1/ Includes all races other than Negro.

FIGURE 4

REJECTION RATES IN RELATION TO AGE

SEPTEMBER 1942 THROUGH JUNE 1943

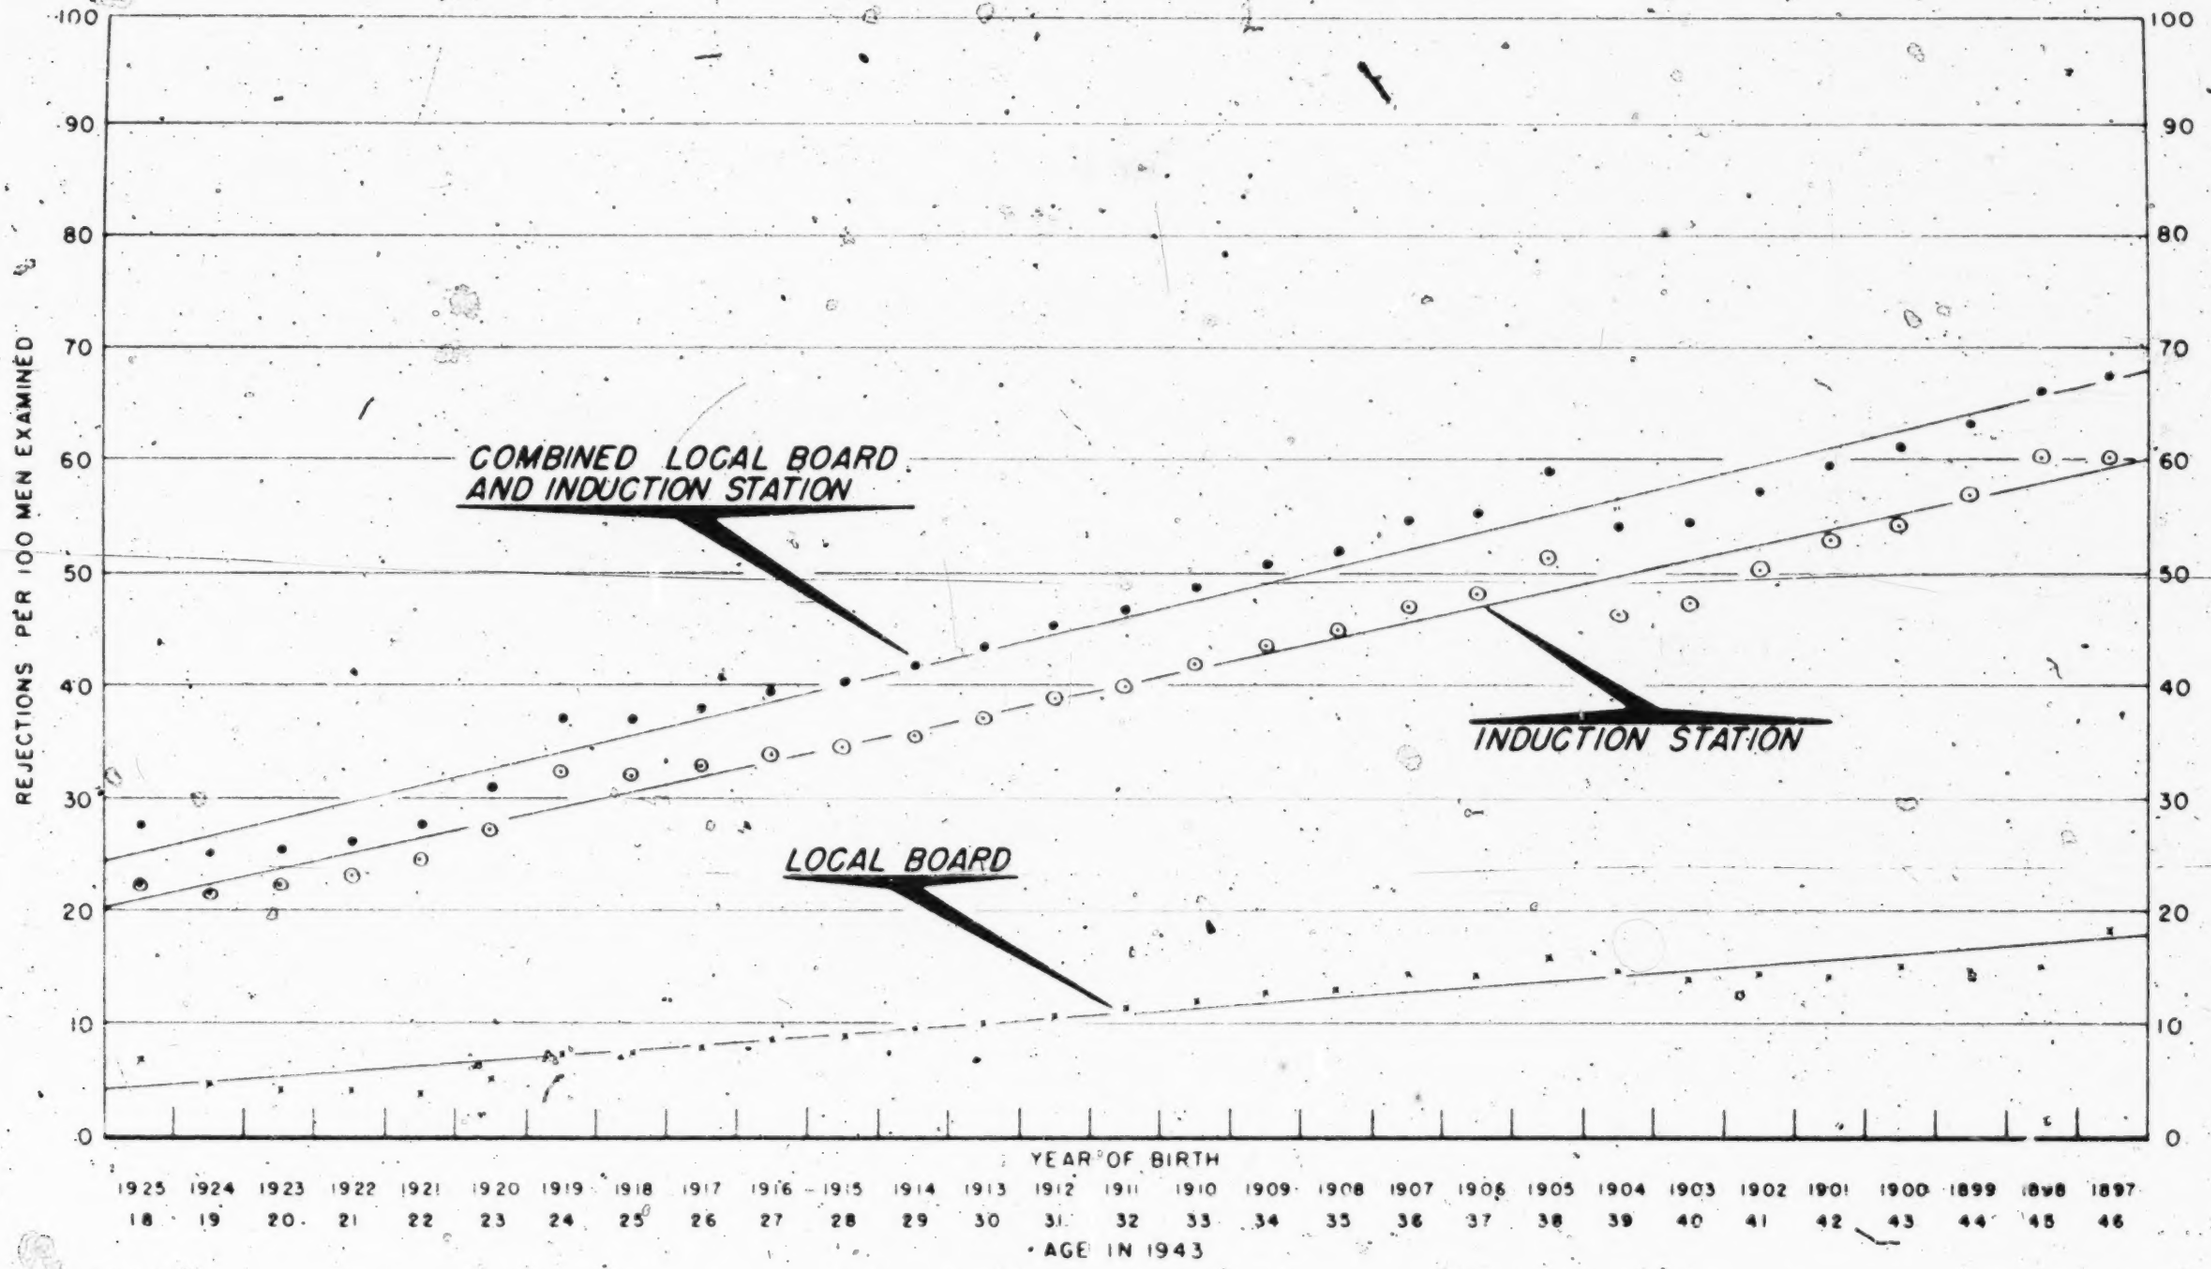

Figure 1 graphically indicates the increase in rejection rates experienced with advancing age. The rejection rates for each age were distinctly lower than those in the earlier periods covered by previous Medical Statistics Bulletins. 1/ They increased approximately 1.4 percentage points per additional year of age, in contrast to a more rapid increase found in an earlier study. Modification of the standards of acceptance doubtless lowered the age specific rejection rates. Even with the reduced standards of acceptance the rejection rate for all registrants passed 50 percent at 34 years of age. For white registrants the rejection rate exceeded 50 percent at age 36, but for Negroes it was reached at age 24. The age specific rejection rates are probably the best indication of the general unfitness of men over 30 years of age to take their place in the armed forces.

Certain age trend inconsistencies are apparent in Figure 1. These are: (1) an inspection of the points in relation to the line fitted for the combined local board and induction station rejection rate shows that most of the rejection rates for registrants born after 1919 and before 1905 fall below the line while those for registrants born in the years 1905-1919 are above the line; (2) rejection rates increased sharply for men born from 1921 to 1919; (3) rejection rates for those born in 1925 were higher than for men born in 1924-1921.

The inconsistencies noted in the preceding paragraph are probably due mainly to differences in the length of time since the various groups had registered. The longer an age group has been registered, the more of its physically fit men have been drawn off through induction and enlistment; hence the greater the likelihood that its current rejection rates will be affected upward. For example, men born in 1905-1919 were registered in the first registration (October 1940) and many of them had been processed for induction, as well as reprocessed under lowered standards, before the groups immediately younger and those immediately older became militarily liable. Consequently a large proportion of the physically fit men in the 1905-1919 year of birth group had been drawn off by the fall of 1942, the beginning of the period shown in Figure 1.

Similarly, the increase in rejection rates from 1921 to 1919 may be explained by the registration dates. Men born in 1919 had been processed since the first registration, in October 1940; those born in 1920 had registered in July 1941 and February 1942; while those born in 1921 had been processed less than seven months from registration until September 1942.

The fact that rejection rates for youths born in 1925--the 18 year old registrants--were higher than those for the groups immediately older is largely explained by the fact that 18 year old registrants

1/ Medical Statistics Bulletin No. 2, page 4, and No. 1, page 5.

examined were not fully representative of their age group as to physical fitness. Contributing factors were: (a) large numbers of physically fit youths born in 1925 enlisted in the armed forces before they became 18 years of age, thus depleting the Selective Service pool of physically fit 1925 youths; and (b) rejection of 18 year olds for physical and mental immaturity.

Rejection Rates by Occupational Groups:

Table 3 indicates that 59.6 percent of domestic service workers were rejected for military service upon examination. Among emergency workers and the unemployed the rejection rate was 56.5 percent and farmers and farm managers had a rejection rate of 56.4 percent. Farm laborers and foremen had a rejection rate of 52.8 percent. No other occupational groups showed rejection rates in excess of 50 percent. At the other extreme were students with a rejection rate of 25.7 percent. This was the only occupational group showing a rejection rate of less than 30 percent. Operatives and kindred workers showed the next lowest rejection rate (37.2 percent).

Table 3
Rejection Rates Per 100 Registrants Examined
by Occupation and Race
April 1, 1942-December 31, 1945

Occupational Group	Total	White 1/	Negro
All Occupations	42.6	40.8	56.1
Professional and Semiprofessional	42.2	41.9	49.1
Farmers and Farm Managers	56.4	54.4	64.5
Proprietors, Managers and Officials, except Farm	46.4	46.1	57.9
Clerical, Sales and Kindred Workers	37.5	37.4	39.2
Craftsmen, Foremen and Kindred Workers	40.7	39.8	54.9
Operatives and Kindred Workers	37.2	35.7	52.8
Domestic Service Workers	59.6	62.1	58.8
Protective Service Workers	42.7	42.2	56.9
Service Workers, except Domestic and Protective	49.1	48.5	50.0
Farm Laborers and Foremen	52.8	49.1	63.5
Laborers, except Farm and Mine	46.6	41.8	58.2
Emergency Workers and Unemployed	56.5	55.6	60.6
Students	25.7	25.6	28.6
Nonclassifiable Returns and No Entry	44.5	43.1	54.5

1/ Includes all races other than Negro.

There were racial differences with reference to the occupational groups showing the highest and lowest rejection rates. Among white registrants domestic service workers showed a rejection rate of 62.1 percent which was the highest among white registrants of any occupational group. Emergency

workers and the unemployed showed the next highest rate of rejection, (55.6 percent) and 54.4 percent of farmers and farm managers were rejected on examination for service. No other occupational group of white registrants showed rejection rates exceeding 50 percent. At the other extreme, white students demonstrated a low rejection rate of 25.6 percent and operatives and kindred workers showed a rejection rate of only 35.7 percent.

In the case of Negro registrants, there were three occupational groups which had rejection rates in excess of 60 percent. Negro farmers and farm managers had a rejection rate of 64.5 percent, the highest rejection rate of any occupational group regardless of race. Farm laborers and foremen had a rejection rate of 63.5 percent and ranked second to farmers. Emergency workers and the unemployed ranked third with a rejection rate of 60.4 percent. Negro students had a rejection rate of 28.6 percent which was the lowest rate for any occupational group among the Negroes. Only one other occupational group--clerical, sales, and kindred workers--had a rejection rate of less than 40 percent.

The rejection rates by occupational groups reveal that farmers, unskilled workers, and unemployed had relatively high rejection rates while students had the lower rejection rates. The data also reveal that operatives, clerical workers, and skilled craftsmen had lower rejection rates than professional workers, proprietors, managers, officials, and laborers.

1259

PRINCIPAL CAUSES FOR REJECTION

This section discusses the principal causes for rejection during the time periods April 1942-March 1943 and April 1943-December 1943. 1/ The entire time period covered by this study was divided into two parts for discussing principal causes for rejection since numerous changes in regulations and policies were made in December 1942 and January 1943 which resulted in changes in the causes for rejection in the last nine months of 1943 in comparison to the period from April 1942-March 1943. Approximately two and one-half to three months elapse after changes in regulations are made before the examination forms are received reflecting these changes in policies and regulations. The major changes which influenced these data are: the Presidential Order of December 1942 which made registrants 18-37 years of age subject to induction and eliminated the enlistment of registrants within this age group; the revision of the List of Defects (Form 220) which was revised August 15, 1942 and January 16, 1943; the revision of War Department Mobilization Regulations, (MR 1-9) as of January 22, 1943, and the provisions for the induction of registrants with syphilis beginning in February 1943.

The data in this section are based upon samples of Reports of Physical Examination and Induction (Form 221) received at National Headquarters during the above-mentioned periods. 2/ While the samples are not of uniform size they represent a certain number of examinations selected at random out of the total number of registrants examined during the period. Therefore, the entire sample for the period April 1942-December 1943 consists of approximately 1,900,000 out of a total of approximately 9,200,000 examinations made or more than a 20-percent sample for the entire period.

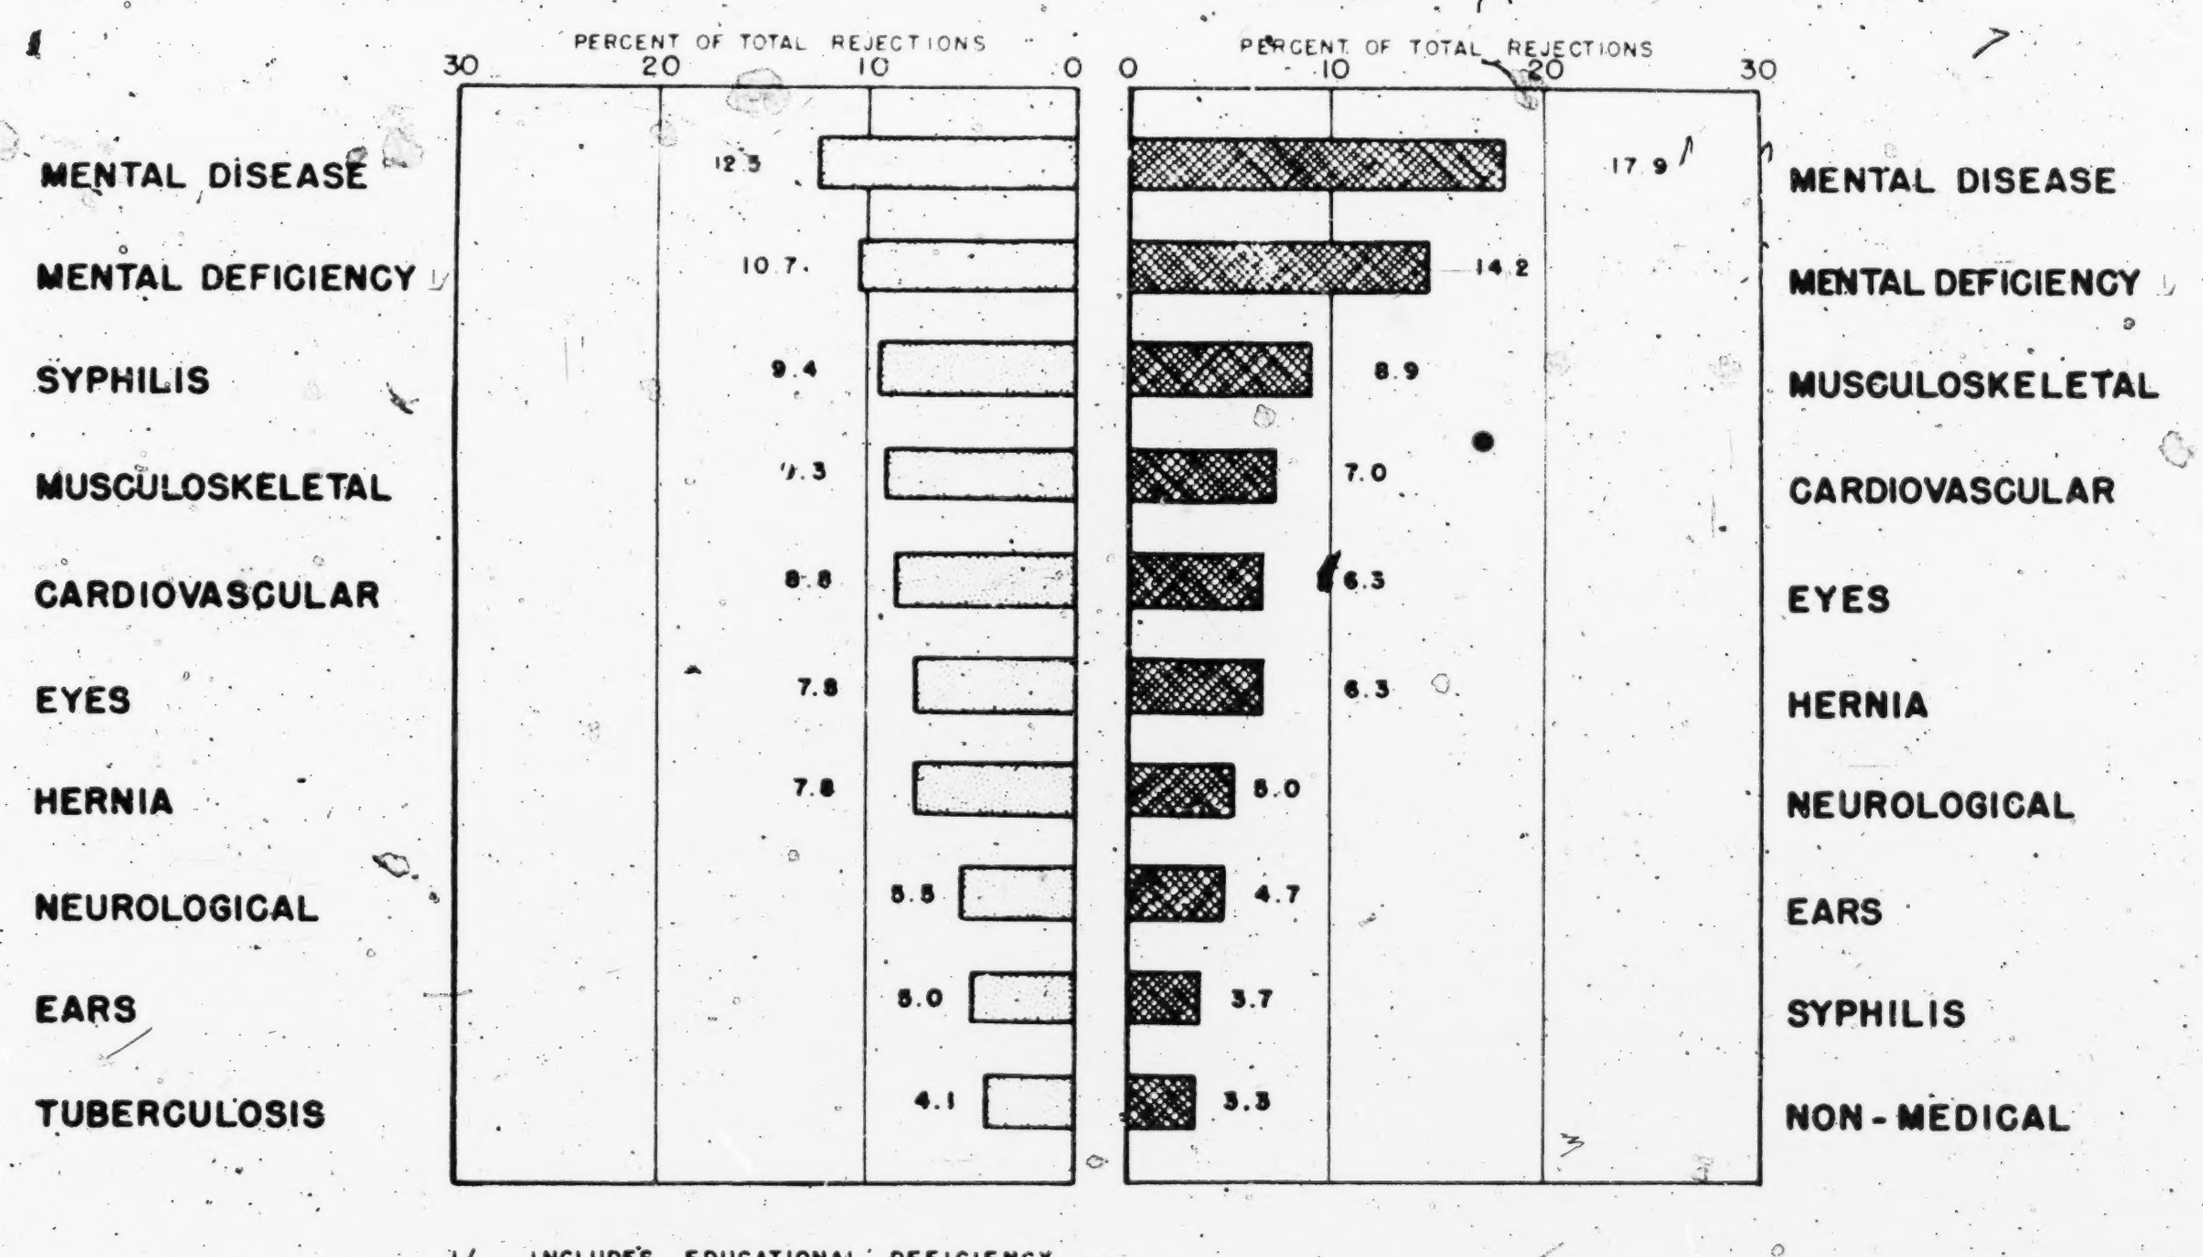
Several of the causes for rejection showed appreciable differences in the two time periods in their relative importance in comparison to all causes for rejection. In the later period defects of the eyes, ears, teeth, cardiovascular system, syphilis, and gonorrhea formed a smaller proportion of all defects than they did up to April 1943. This was in part the result of modifications in standards of acceptance which permitted increased numbers of registrants with some of these defects to be inducted.

1/ The term "principal cause for rejection" may be defined as the first disqualifying defect recorded as cause for rejection on the Form 221.

2/ The samples selected for analysis were as follows: April 1942-July 1942, 100 percent; November 1942, 12½ percent; December 1942-May 1943, 25 percent; June 1943-September 1943, 16 2/3 percent; November 1943-December 1943, 10 percent. Prior to November 1943 the sample was based upon a percentage of the forms received at National Headquarters in the months specified, while after November 1943 the sample was based upon a percentage of the forms for registrants examined in the months specified.

On the other hand, educational and mental deficiency, mental disease, defects of the feet, and non-medical causes for rejection became relatively more important in the period April 1943-December 1943 than they were in the earlier period. The increase in the importance of these defects may have resulted from the decrease in the importance of the other defects already discussed.

The overall local board and induction station rejection picture for the period from April 1942-March 1943 indicates that mental disease accounted for one in every eight rejections and that next in order of importance were syphilis, musculoskeletal defects and cardiovascular defects which together with mental disease accounted for 40 percent of all rejected registrants. In the period April 1943-December 1943 mental disease was again the leading cause for rejection among all registrants, this defect being responsible for approximately 18 percent of all rejections at the local boards and induction stations combined. Educational and mental deficiency, musculoskeletal defects, and cardiovascular defects ranked next in importance and these defects plus the leading defect constituted 48.0 percent of all rejections. (See Figure 2).



The ten leading causes for rejection present racial differences of sufficient importance to warrant discussion. Table 4 presents the ten leading causes for rejection during the two selected time periods by race and indicates the percent of all rejections accounted for by each of the ten leading causes. Figure 3 presents the same data in a graphical manner.

Mental disease led the list for white registrants in both time periods and constituted 14.2 percent of all rejections in the first period and 19.2 percent of rejections in the later period. In both time periods, musculoskeletal defects were second in importance among white registrants, being responsible for 10.1 and 9.8 percent of all rejections in the respective time periods. The next eight leading causes for rejection showed distinct changes in rank position between the first and second time periods. Educational and mental deficiency increased in importance from the sixth to the third rank position as a cause for rejection among white registrants. This defect also increased from 8.1 to 9.1 percent of all white rejections. Hernia and eye defects exchanged rank position between the first and second time period, but both defects formed a considerably smaller portion of all rejections in the second period than prior to April 1943. Tuberculosis and syphilis were the ninth and tenth causes for rejection prior to April 1943 while syphilis did not appear among the ten leading causes for rejection after that time and tuberculosis became the tenth leading cause for rejection in the later time period.

1/ Includes all races other than Negro.

The modification of the medical standards affected the Negro list of leading causes for rejection more appreciably than the list for white registrants. Syphilis, the main cause for Negro rejections up to April 1943 became the third most important cause for rejection in the period after April 1943. In this period it followed educational and mental deficiency and mental disease. Syphilis was the cause of 30.4 percent of rejections among Negroes in the earlier time period and was responsible for only 11.0 percent in the later period. Educational and mental deficiency combined constituted 21.2 percent of Negro rejections in the first period and 33.5 percent of rejections subsequent to March 1943. Mental disease shifted from the fourth to the second leading cause for rejection and comprised 5.8 percent and 13.0 percent of all rejections in the respective time periods. Most of the other leading causes for rejection shifted position slightly as a result of the marked changes in the importance of syphilis and educational and mental deficiency. Gonorrhea did not appear among the ten leading causes for rejection in the later period; this was a direct result of changes in the regulations permitting registrants with uncomplicated gonorrhea to be inducted. Defects of the genitalia also failed to appear as one of the ten leading causes for rejection among Negroes in the period after March 1943. Gonorrhea and defects of the genitalia were replaced by defects of the feet and non-medical causes after March 1943. Table 5 indicates a similar percent distribution of causes for rejection for all the broad defect groups and permits a detailed comparison of the importance of each of the defect groups in both time periods and by race.

1/ Includes all races other than Negro.
* Less than 0.1 percent.

A more detailed analysis of the principal causes for rejection is possible if each time period is discussed separately. Tables 3 and 4 in Appendix C indicate the percent distribution of principal causes for rejection at local boards and induction stations separately and by race for the two time periods. These tables serve as the basis for the discussion which follows.

Local Board Rejections April 1942-March 1943

Local board rejections in the period from April 1942-March 1943 were primarily for musculoskeletal defects in the case of white registrants and syphilis for Negro registrants. These defects comprised 20.0 percent and 69.1 percent of all local board rejections for the respective races. Syphilis (13.7 percent) and neurological defects (11.5 percent) constituted the next two important causes for the rejection of white registrants. Musculoskeletal defects (7.5 percent) and hernia (4.4 percent) were second and third causes for rejection of Negro registrants during this period.

Induction Station Rejections April 1942-March 1943

Causes for rejection at induction stations during this period differed markedly from those at local boards with mental disease the cause of 17.7 percent of all rejections among white registrants and educational and mental deficiency comprising 35.0 percent of all rejections among Negro registrants. Cardiovascular and eye defects were of second and third importance as causes for rejection of white registrants at the induction station and cardiovascular defects and mental disease were the second and third most important causes for rejection of Negro registrants rejected at the induction station.

Local Board Rejections April 1943-December 1943

In the period from April 1943-December 1943 musculoskeletal defects were the predominant cause for rejection of white registrants upon local board examination and accounted for 20.2 percent of all rejections. Hernia and neurological defects were next in order of importance as causes for the rejection of white registrants. Among Negroes, syphilis was responsible for 50.3 percent of all local board rejections and was followed in importance by hernia and musculoskeletal defects.

Induction Station Rejections April 1943-December 1943

The causes for rejection at induction stations were considerably different from those of local board rejections in this period as they were in the earlier period. Mental disease constituted 21.5 percent of all white rejections and was followed by educational and mental defi-

ciency and musculoskeletal defects which were responsible for 9.7 and 8.0 percent of white rejections. Educational and mental deficiency were responsible for 39.2 percent of Negro rejections. This defect was followed by mental disease (15.0 percent) and cardiovascular defects (7.5 percent) as the second and third most important causes for rejection.

Internal Composition of Broad Defect Groups

In the remaining portion of this section the internal composition of the broad defects is discussed. The data on which the discussion is based appear in Appendix C, Table 5. The defects are discussed in the order in which they appear in that table rather than in the order of their importance as causes for rejection.

Eye Defects. Eye diseases were the predominant eye defect, occurring in 43.5 and 46.7 percent of all eye defects in the two periods, respectively. Defective vision ranked second among eye defects in both periods. However, this type of eye defect was of considerably less importance among the Negroes than eye diseases. On the other hand, bilateral blindness occurred more frequently in Negro than in white registrants but occurred less frequently in respect to other eye defects in the period April 1943-December 1943 than in the period April 1942-March 1943. The same relationship occurred for unilateral blindness which constituted only 6.1 percent of eye defects if the second period as compared to 12.5 percent in the first period.

Ear Defects. Otitis media was the predominant ear defect recorded in both periods and formed relatively the same percentage of the total number of ear defects in both of the time periods. It was followed by the miscellaneous group of ear defects. There were no marked changes between the two time periods, except that bilateral deafness and unilateral deafness became less important in relation to all ear defects after March 1943 in comparison to the period April 1942-March 1943. It is noticeable that bilateral deafness, unilateral deafness and defective hearing were of considerably more importance in relation to total ear defects among Negroes than was the case in white registrants. Otitis media accounted for more than 60 percent of all ear rejections but in many of these cases perforated ear drums were also present.

Teeth Defects. During both time periods dental defects were of insignificant importance as a cause for rejection. However, of the few registrants rejected for teeth abnormalities the leading type of defect in both races was missing teeth followed in the first period by dentures and in the second period by dental caries. Nearly one-half of all registrants rejected for dental defects were rejected for missing teeth; in the early period 20 percent were rejected for dentures and in the later period 24.2 percent for dental caries. It is noticeable that in both periods dental caries were of more importance in relation to all dental defects among Negro than among white

registrants and that dentures were less prevalent among Negro than white registrants.

Nose Defects. Prior to April 1943 simusitis was the predominant nose defect causing rejection, followed by vasomotor rhinitis; while in the period April 1943-December 1943 these two causes for rejection changed positions in relative importance. It is noticeable that nasal diseases and deformities were of more importance among Negroes than was vasomotor rhinitis and in both time periods nasal diseases and deformities ranked second for this race. Simusitis on the other hand was also of more importance among defects of the nose in Negroes than among white registrants, being responsible in the earlier period for more than 50 percent of all nose rejections and for 44.2 percent in the later time period.

Throat Defects. In both time periods miscellaneous throat defects were predominant over defects of the tonsils. In the first period these defects constituted 68.4 percent of all throat defects and in the later period 51.4 percent. It is significant that in both time periods the importance of tonsil defects among the Negroes exceeded other throat defects, being responsible for 60.5 percent of throat rejections in the earlier period and 51.9 percent in the later period.

Lung Defects. While defects of the lungs were not among the ten leading causes for rejection they were relatively important as a cause for rejection. This group does not include tuberculosis. The distribution for specific types of lung defects was the same in both time periods with asthma accounting for more than 60 percent of those rejected for pathological conditions of the lungs. Asthma formed a relatively larger proportion of lung defects among the Negro registrants than among white registrants.

Tuberculosis. Tuberculosis ranked among the ten leading causes for rejection. Essentially, the group is composed of pulmonary tuberculosis either active, arrested, or suspected. In the first period the active cases and suspected cases each formed 33.1 percent of the total with arrested pulmonary tuberculosis comprising 29.4 percent. Among Negroes, the arrested form of tuberculosis was the most prevalent with the unspecified or suspected type second and the active type third. In the second period active tuberculosis was most important, followed by suspected or unspecified tuberculosis; arrested tuberculosis was third. For Negroes during the second period, the importance of active tuberculosis exceeded that in white registrants, as did the arrested type. However, the suspected or unspecified type was of slightly less importance among the Negro than the white registrant.

Cardiovascular. Cardiovascular defects were among the more important causes of rejection. Within the group, the early period showed arterial hypertension as the most prevalent cardiovascular condition in both races, with the importance of this particular defect very marked among the Negro race. However, beginning in April 1943 valvular heart disease slightly outweighed arterial hypertension as the most prevalent specific defect within the group. It is significant, however, that in the case of Negroes arterial hypertension was by far the most important subdivision of cardiovascular disease. The data indicate that rheumatic heart disease and tachycardia were less frequently a cause for rejection among the Negro race than they were among white registrants. The two defects just mentioned formed a far smaller percentage of the total cardiovascular rejections for Negro than they did for white registrants.

Hernia. Hernia appeared among the 10 leading causes for rejection. Nearly 89 percent of all rejections for this defect were the result of inguinal hernia and approximately 7 percent of the rejections were due to abdominal hernia. The relative importance of abdominal hernia in comparison to inguinal hernia was greater among the Negro than the white registrants, occurring approximately twice as frequently as the cause for rejection among Negroes as for all other races. Inguinal hernia occurred less frequently among Negroes but still comprised more than 83 percent of all hernia rejections for that race.

Kidneys and Urinary System. This group of defects was relatively unimportant as a cause for rejection. Laboratory findings were the basis of 44.8 percent of the rejections for this cause in the period prior to April 1943 and were responsible for 57.6 percent after that. It is noticeable that urinary findings were more important as a cause for rejection among Negroes than white registrants.

Abdominal viscera. The abdominal viscera group of defects was predominantly composed of gastric ulcer which constituted 65.3 percent in the first time period and 75.1 percent in the second. However, it is important that in the earlier period, the distribution among the Negroes was approximately equal between gastric ulcer and other gastro-intestinal defects. In both periods the importance of the other gastro-intestinal defects was greater among the Negroes than it was among white registrants.

Genitalia. This group of defects was not one of the more prevalent causes for rejection. In the earlier time period the group was led by miscellaneous defects of the genitalia and undescended testicle. Nearly 79 percent of the Negro rejections in this group resulted from miscellaneous defects of the genitalia. In the later

period undescended testicle became more important, forming 44.6 percent of all rejections for this group while the prevalence of miscellaneous defects among the Negroes was still greater among that race, constituting 68.6 percent of all rejections for defects of the genitalia.

Syphilis. Syphilis as a cause for rejection was subject to change in regulations during the two time periods. Registrants with syphilis became inductible in February 1943 and while the effects of this provision were not immediately felt they were definitely reflected in the period April 1943-December 1943. Prior to April 1943 positive serology with no other findings was the predominant type of defect within the group constituting 72.5 percent of all rejections, while miscellaneous syphilis ranked second with 24.6 percent. In that period the importance of positive serology among the Negroes was slightly higher than for white registrants (74.0 percent). In the later period the importance of positive serology had greatly diminished due to the fact that registrants having only a positive serology were generally inducted. For all races this type of rejection constituted only 51.9 percent of all rejections for syphilis with 24.7 percent of the rejections being based on a diagnosis of neurosyphilis and 21.6 percent based on diagnosis of other types. However, among white registrants the differences were even more striking with 31.6 percent of all rejections for syphilis being based upon positive serology. Among white registrants 43.0 percent of syphilitic rejections were the result of a diagnosis of neurosyphilis and 24.0 percent were for other or miscellaneous types of syphilis. In the case of the Negro, however, 63.3 percent of all syphilis rejections in that race continued to be based upon positive serology alone with 20.3 percent based upon miscellaneous types and 14.2 percent diagnosed as neurosyphilis.

As the induction of syphilitics goes forward rejections for neurosyphilis will constitute a larger proportion of the total rejections for syphilis and, although there is a racial difference in respect to neurosyphilis the observed difference might be less but for the fact that a larger proportion of white registrants with uncomplicated syphilis has been inducted than Negroes. Therefore, the backlog of potential inductible syphilitics is relatively greater among the Negroes than the whites. (See Table 6).

It is noticeable that the change in the importance of positive serology among white registrants decreased from 71.9 percent syphilitic rejections in the period April-June 1942 to 7.2 percent in the period November-December 1943. During the same period neurosyphilis rose from 5.6 percent of white syphilitic rejections to 77.5 percent among these registrants. Cardiovascular syphilis rose from 0.6 percent to 4.0 percent in the span of this period while miscellaneous or other types decreased in importance from 21.9 percent to 11.3 percent. In the case of Negroes there was a decrease in the importance of positive serology from 77.6 percent of all syphilitic rejections to 13.7 percent. It is obvious, however, that the

decrease was not as rapid nor did it progress as far as among white registrants. Neurosyphilis increased from 0.7 percent to 61.1 percent of syphilitic rejections. Cardiovascular syphilis increased from 0.2 percent to 12.4 percent of rejections and the miscellaneous types decreased from 21.5 to 12.8 percent. These figures indicate that positive serology remained the most important syphilitic diagnosis among Negroes up to November 1943.

Table 6
Percent Distribution of Types of Syphilis Among Registrants Rejected at Local Boards and Induction Stations
April 1942-December 1943

Month of Receipt of Form 221	White 1/					Negro

1/ Includes all races other than Negro.

Gonococcus Infection and Other Venereal Diseases. Gonococcus infection was the predominant defect among this group comprising, in the first period, more than 91.2 percent of all rejections within the group while in the second period it comprised 85.3 percent. It is noticeable however, that other venereal infection was of more importance among the Negro than white registrants. In the first period, 10.8 percent of Negro rejections in this group were for other venereal infections while in the later period 19.2 percent among Negroes were for other venereal infections.

Educational and Mental Deficiency. This group constituted one of the most important causes for rejection. It is composed of three main subdivisions, educational deficiency, mental deficiency, and the specific diagnoses of morons, imbeciles and idiots. Until June 1, 1943, registrants who could not read or write as well as a

student who had completed four years in an American grammar school could be rejected. After June 1, 1943, all non-high school graduates were given a mental test or series of tests at the induction station. Those who failed were classed as mentally deficient and were rejected because of "failure to pass minimum intelligence standards". In the earlier period, these registrants would have been rejected, in many cases, for educational deficiency. For this reason mental deficiency and educational deficiency are generally grouped together for purposes of discussion. The line of demarcation between the two groups has never been clearly defined.

From April 1942-March 1943 educational deficiency comprised 73.8 percent of all rejections within this group, with morons, imbeciles, and idiots comprising 13.7 percent and mental deficiency 12.5 percent. The importance of educational deficiency among the Negro race was much greater than among white registrants, comprising 85.8 percent of all rejections within this group during this period in contrast to 65.6 percent among white registrants. Also, in the case of the Negroes mental deficiency ranked second, comprising 7.3 percent of the rejections within the group while morons, imbeciles, and idiots comprised only 6.9 percent. The picture between April 1943-December 1943 was different. While 71.7 percent of all rejections in the group continued to be for educational deficiency, mental deficiency had become relatively more important, comprising 21.6 percent of the rejections. Morons, imbeciles, and idiots became less important, comprising only 6.7 percent. In respect to the Negro race, the importance of educational deficiency diminished as a result of the change in induction station procedures. It now comprised only 74.6 percent of all rejections within the group while mental deficiency had become more important, comprising 22.5 percent. Morons, imbeciles, and idiots diminished greatly in importance, constituting only 2.9 percent of rejections within this group. In the case of white registrants, it is interesting to note that educational deficiency comprised a larger percentage in the later than in the earlier time period, being responsible for 69.0 percent of rejections in this group. Mental deficiency increased to 20.6 percent while the importance of morons, imbeciles, and idiots within the group decreased to 10.4 percent.

Mental Disease. This group constituted the leading cause of rejection among Selective Service registrants. It was predominantly composed of psychoneurotic disorders which constituted 51.6 percent and 56.7 percent of all rejections within the group in the two respective periods. Psychopathic personality was of second importance within the group, constituting 27.3 percent and 31.2 percent of the rejections, with grave mental and personality disorders third and chronic inebriety and drug addiction fourth. Among Negroes, psychopathic personality and

psychoneurotic disorders were of approximately equal importance as causes for rejection. Among white registrants psychoneurotic disorders far outweighted psychopathic personality. The relative importance of psychopathic personality was much greater among Negro than white registrants. Grave mental or personality disorders, as well as chronic inebriety and drug addiction, were of less relative importance among Negroes than white registrants.

Neurological Defects. This group of defects was of sufficient importance to appear among the ten leading causes for rejection. Miscellaneous diagnoses within the group accounted for the largest proportion of the rejections (36.9 percent and 42.8 percent in the respective periods). Approximately 20.4 percent of the neurological rejections in the earlier period and 17.2 percent in the later period were the result of epilepsy. Residuals of poliomyelitis ranked second among white registrants while post-traumatic cerebral syndrome ranked second among the Negroes in both periods. Epilepsy, which was of equal importance with post-traumatic cerebral syndrome among Negroes during the first period, was less important in the second period. Chronic encephalitis was relatively less important as a cause for rejection of Negro than of white registrants.

Musculoskeletal. This group of defects was one of the most important and appeared near the top of the ten leading causes for rejection. Residuals of injury constituted 31.5 percent and 34.1 percent of all rejections within the group for the respective periods. Congenital and miscellaneous defects ranked second in both periods, constituting 20.6 and 23.6 percent of rejections while amputations ranked third, constituting 13.3 and 11.3 percent. Racial differences within this group of defects were not very prevalent. However, residuals of injury and amputations were relatively more important among Negroes than white registrants. Osteomyelitis and muscular atrophy were less important in the Negro group than among white registrants.

Feet Defects. Pes planus accounted for the majority of rejections for foot defects in both periods--75.9 percent in the first and 84.8 percent in the second. It was relatively more important as a cause for rejection of Negroes than of white registrants. Other foot defects, such as clubfoot and hallux valgus, were relatively more important among white registrants.

Endocrine Disturbances. Diabetes mellitus accounted for four out of every ten rejections in this defect group during both periods. The proportion was the same for both white and Negro registrants. Fröhlich's syndrome was next in importance and was followed by thyroid disturbances, which were less important in the second period than in the first.

Neoplasms. Pilonidal cysts accounted for more than one-half of the white rejections for neoplasms during both periods. In contrast, this defect constituted only 6.9 percent of the total Negro rejections for neoplasms in the earlier period and 12.6 percent in the later. Other neoplasms were far more important for Negroes than for whites, while the malignant growths were of approximately equal importance for both races.

Weight and Height Deviation. Rejections for weight and height deviation were often recorded as gigantism, dwarfism, or as endocrine disorders. For this reason, the figures shown represent an understatement of the actual importance of weight and height deviation as causes for rejection. In the group of miscellaneous defects, underweight and underheight were relatively more important as causes for rejection than overweight and overheight respectively.

Age Specific Rejection Rates for Selected Defects

Rejection rates by age groups are available for some of the more important defect groups covering the period April 1942-March 1943. Table 7 indicates that tuberculosis rejection rates became progressively higher in each age group for both races. The rates for Negro and white registrants were almost identical in the 18-25 year age group. However, the rate for Negroes increased only slightly in the older age groups while the white rates increased markedly.

Table 7

Rejections for Selected Defects per 1000 Registrants Examined by Age Groups and Race
April 1942-March 1943

Defect Group	White 1/				Negro			
	18-25	26-29	30-37	38 & over	18-25	26-29	30-37	38 & over
Mental disease	34.6	54.7	75.5	91.8	30.5	25.2	36.9	63.2
Tuberculosis	9.4	13.4	19.7	30.9	9.2	10.9	12.9	15.7
Cardiovascular	27.7	34.6	43.1	60.9	30.9	40.3	54.3	76.8
Syphilis	5.2	14.5	27.4	36.5	111.5	181.9	225.2	269.0
Mental deficiency	9.1	8.9	10.5	19.2	18.5	21.6	19.1	17.3
Educational deficiency	21.0	22.2	24.7	23.0	112.1	111.2	97.9	81.2
Neurological	21.1	21.4	25.1	38.3	11.9	12.9	17.0	22.7

1/ Includes all races other than Negro.

For both races cardiovascular system rejection rates increased with advancing age, but the increase was more rapid among Negro than white registrants.

The rejection rate for syphilis increased from 5.2 per 1,000 examined for white registrants in the age group 18-25 years to 36.5 in the group 38 years of age and over. Among Negroes the rejection rate for syphilis increased from 111.5 in the age group 18-25 years to 269.0 in the age group 38 years and over.

Among white registrants the rejection rate for mental disease increased regularly with increasing age. In the case of Negroes the group 18-25 years of age had a higher rejection rate than the group 26-29 years of age. At age 30 the rejection rates for this defect rose to a point exceeding the rate for the 18-25 year old group and continued to increase in the older age groups. The rejection rate for this defect was consistently lower for Negroes than white registrants in all age groups.

The rejection rates for neurological disorders among white registrants were approximately the same for the age groups 18-25 and 26-29 and increased beyond the age of 30 with a pronounced increase in the rejection rate in the group 38 years of age and over. The rejection rate for this defect was consistently lower among Negro than white registrants and the same type of increase was noted in the age group 30-37 years and the group 38 years of age and over.

The rejection rate for mental deficiency remained relatively constant for white registrants except in the age group 38 years of age and over. The rate in the latter group was nearly twice that for men under 38 years of age. This fact is not observed in the Negro rejection rate for mental deficiency. The rejection rate for this defect remained relatively constant among Negroes of all ages.

Rejections for educational deficiency followed a consistent pattern for white registrants in all age groups. It varied from 21.0 in the age group 18-25 to 24.7 in the age group 30-37. The rate for this defect among Negroes was considerably higher than for white registrants, being 99.8 per 1,000 Negroes of all ages who were examined. In the case of this race there was a definite downward trend from 112.1 in the age group 18-25 years to 81.2 for the group 38 years of age and over.

INCIDENCE OF ALL RECORDED DEFECTS

This section deals with the incidence of all recorded defects among inducted and rejected registrants in contrast to the discussion of the principal causes for rejection contained in the previous section. Many of the rejected registrants had other defects in addition to the principal cause for rejection and in many cases inducted registrants had one or more recorded defects which were non-disqualifying in nature. The tabulation covering the period April 1942 through December 1943 showed an average of 1.0 defects per registrant examined. 1/ The rate for white registrants was slightly above this, and that for Negroes was slightly below. It was found that 36.9 percent of all registrants examined had no recorded defect; the figure for white registrants being 38.0 percent and for Negroes 30.5 percent. Several defects which were not important as causes for rejection were found among the first ten recorded defects. Probably not all minor defects have been recorded and, if recorded, it is certain that all defects have not been coded since only those which were listed in the summary of defects on Form 221 have been transposed to code. It still remains however that the major defects have been recorded. No attempt has been made to measure the extent of acute illnesses among the examined registrants.

Data on the incidence of illness in other surveys are not comparable with the present data on the incidence of recorded defects. 2/ A survey of illnesses measures the acute conditions arising from a pathological defect while the examination of Selective Service registrants confines itself to a record of pathological defects without reference to any acute illness which may have resulted from it. This fact is best illustrated in recording defects of the tonsils. An infection of the tonsils may cause two or three periods of illness annually but the defect is recorded only once and represents an existing pathological condition without reference to resulting illnesses. The registrant is either qualified for military service because the recorded defects are of insufficient importance to cause disqualification or is rejected for service because the defect is a disqualifying pathological condition.

Defects most frequently recorded on Form 221 do not appear in the same order as do the leading causes for rejection. Minor abnormalities

1/ This is considerably lower than the 1.6 defects per person shown in Medical Statistics Bulletin No. 2 (p. 10). However, a change in coding procedure may account for this decrease. For the peacetime examinations, defects listed in the detailed physical examinations were coded, whereas during wartime the coding was confined to certain lines which summarized the defects and the complete list of defects did not always appear in the summary.

2/ Collins, Selwyn D. The Sickness Surveys; Types, History and Some Results. Thomas Nelson and Sons, 1941, chapter 12, pages 185-213.

are not important enough for rejection but form an important part of the total defect picture. The ten most frequently recorded defects by race are indicated in Table 8 in order of importance:

Table 8
A Comparison of the Ten Most Frequently Recorded Defects With the Ten Leading Causes for Rejection, by Race
April 1942-December 1943

White 1/		Negro	
Incidence of Recorded Defects	Causes for Rejection	Incidence of Recorded Defects	Causes for Rejection
Eyes	Mental disease	Syphilis	Educational and mental deficiency
Teeth	Musculoskeletal	Educational and mental deficiency	Syphilis
Musculoskeletal	Cardiovascular	Eyes	Mental disease
Mental disease	Educational and mental deficiency	Musculoskeletal	Cardiovascular
Underweight and overweight	Eyes	Cardiovascular	Musculoskeletal
Feet	Hernia	Feet	Hernia
Hernia	Neurological	Mental disease	Eyes
Cardiovascular	Ears	Teeth	Neurological
Ears	Tuberculosis	Hernia	Gonorrhea and other venereal
Educational and mental deficiency	Syphilis	Underweight and overweight	Feet

1/ Includes all races other than Negro.

Several defects appearing on the above list of recorded defects do not appear on the lists of leading causes for rejection. Teeth, for example, are second on the white list and eighth on the Negro list but do not appear on the list of important causes for rejection for either race. Additional examples of this nature are underweight and overweight, for Negro registrants, and feet defects for white registrants.

On the other hand, certain types of defects appear on the list of leading disqualifying defects although they did not occur frequently enough to appear on the list of all recorded defects. Such defects are: neurological disorders, tuberculosis and syphilis for white registrants, and neurological disorders, gonorrhea and other venereal diseases for Negroes.

Table 9 indicates the incidence of each broad defect group per 1,000 registrants examined. Table 6, Appendix C gives a more detailed breakdown of defects within each of these broad groups.

Table 9
Incidence of Defects in Examined Registrants, by Race
April 1942-December 1943 1/

Defect Group	Incidence per 1000 Examined		
	Total	White 2/	Negro
All Defects	1000.2	1008.7	953.2
Eyes	136.1	147.9	70.7
Ears	35.1	39.3	11.5
Teeth	113.0	124.7	47.7
Mouth and gums	14.5	15.1	11.2
Nose	25.8	29.4	5.6
Throat	7.3	7.4	6.4
Lungs	15.4	16.0	12.0
Tuberculosis	19.1	19.9	14.6
Cardiovascular	51.0	49.8	57.7
Blood and blood-forming	0.6	0.7	0.1
Hernia	50.2	52.1	40.2
Kidney and urinary	11.5	12.3	7.2
Abdominal viscera	11.0	12.2	4.3
Genitalia	33.7	34.1	32.0
Syphilis	50.2	20.8	214.7
Gonorrhea and other venereal	6.3	2.3	28.7
Skin	14.0	15.2	7.2
Hemorrhoids	11.3	11.6	9.1
Varicose veins	16.2	17.3	9.7
Educational and mental deficiency 3/	50.7	36.8	128.2
Mental disease	67.5	70.6	50.3
Neurological	28.0	29.6	19.0
Musculoskeletal	86.1	90.8	59.6
Feet	54.6	55.0	52.5
Endocrine	8.5	9.6	2.5
Neoplasms	9.4	10.2	4.9
Infectious and parasitic	0.6	0.6	0.5
Underweight and overweight	65.5	70.4	37.8
Other medical	7.0	7.0	7.3

1/ Forms 221 are included for the periods April-July 1942, November-December 1942, January-February 1943, and November-December 1943.
2/ Includes all races other than Negro.
3/ Includes registrants rejected for educational deficiency before June 1, 1943 and for failure to meet minimum intelligence standards after that date as well as those rejected for mental deficiency.

Eye Defects. Eye abnormalities led the list of recorded defects for white registrants and were third on the list for Negroes. This is in contrast to the importance of "conditions of the eye" as cause for rejection. This type of defect most frequently restricted a registrant to limited service. Eye defects were recorded in 136.1 of every 1,000 registrants examined; the figure was 147.9 among white registrants and 70.7 among the Negroes. Thus eye abnormalities were twice as frequent among white as Negro registrants. Bilateral blindness occurred infrequently in both races, but unilateral blindness occurred in approximately 7 registrants per 1,000 with the occurrence being slightly less for Negro than white registrants. Refractive error (defective vision) was the most frequently recorded condition of the eye, occurring in 100.4 white registrants and in 36.4 Negro registrants per 1,000 examined. Diseases of the cornea and retina, cataract, and other eye diseases occurred nearly 40 times per 1,000 examinations. Again in the case of this defect the incidence among Negroes was less than that for white registrants.

Ear Defects. Ear defects were relatively infrequent among Negro registrants. This is illustrated by the incidence of 39.3 ear defects per 1,000 white registrants and 11.5 per 1,000 Negroes examined. Otitis media led the list of ear defects among white registrants while defective hearing was the most prevalent ear abnormality among Negroes. Bilateral and unilateral deafness were not frequently recorded ear conditions but the latter occurred twice as frequently as the former. Serious conditions of the ear such as deafness, otitis media and severe defective hearing were almost always disqualifying, but in spite of this fact the defect was more important as a recorded defect than as a cause for disqualification.

Teeth Defects. The changes in regard to dental examination between peacetime and wartime were very drastic. The result has been that dental defects ceased to be the leading cause for rejection. The decrease in importance was reflected even in the number of dental defects recorded in wartime. Since this type of defect was not disqualifying probably not all cases of carious and missing teeth were recorded in the summary of defects. In spite of these changes 113 registrants per 1,000 examined were found to possess dental defects. The figure for white registrants was 124.7 and for Negroes 47.7. Missing teeth were the most prevalent defect and dentures were next in importance. These occurred in 53.1 and 36.2 registrants per 1,000 examined respectively. In the case of Negro registrants missing teeth and dental caries were the most prevalent.

Special tabulations covering the period April-July 1942, given in Table 10, indicate that every 1,000 registrants examined at the induction station had 6,339 missing teeth, 795 non-restorable

carious teeth and 1,272 restorable carious teeth. The difference between races was quite marked with respect to missing teeth, 6,648 per 1,000 white as compared to 2,745 per 1,000 Negroes examined. However, non-restorable carious teeth among the Negroes were more prevalent than among white registrants; the reverse was true with respect to restorable carious teeth.

Table 10

Number of Missing, Non-restorable and Restorable Carious Teeth per 1,000 Registrants Examined at Induction Stations April-July 1942

Disposition Following Examination	Missing Teeth	Non-restorable carious	Restorable carious
All races	6,339.3	794.9	1,272.5
Inducted	5,975.4	616.4	1,243.6
Rejected	6,996.7	1,117.3	1,324.7
White 1/	6,647.9	794.0	1,285.7
Inducted	6,231.5	611.8	1,256.8
Rejected	7,414.5	1,129.5	1,338.8
Negro	2,745.5	804.5	1,119.2
Inducted	2,719.9	674.5	1,076.0
Rejected	2,782.8	994.5	1,182.2

1/ Includes all races other than Negro.

Mouth and Gum Defects. Defects of the mouth and gums occurred in 14.5 registrants per 1,000 examined. The incidence of this group of defects was approximately equal among white and Negro registrants. Gingivitis and pyorrhea were the predominant defects falling within this group.

Nose Defects. This group was found infrequently among Negro registrants but was prevalent in 29.4 white registrants per 1,000 examined. Nasal obstruction constituted approximately 60 percent of recorded defects in this group. This particular defect was 7 times more prevalent among white than Negro registrants.

Throat Defects. Defects of the throat were of little concern as a cause for rejection and were recorded as a defect in only 7.3 cases per 1,000 examined. The group was primarily composed of defective

tonsils. The overall frequency was approximately the same for white and Negro registrants.

Lung Defects. Most defects of the lungs were severe enough to be disqualifying. The incidence of recorded defects of this type was about 15 per 1,000 registrants examined. The incidence among white registrants was 16 and among Negroes 12 per 1,000 examined. Asthma constituted the leading single defect within this group and accounted for about one-half of the recorded lung defects in both races.

Tuberculosis. During 1942 and 1943 the majority of the examined registrants were forwarded to induction stations where a routine chest x-ray was taken. In peacetime, chest x-rays were not taken routinely at local boards. This is a major factor in the increase in the recorded incidence of tuberculosis from 9.7 per 1,000 local board examinations in peacetime to 19.1 per 1,000 local board and induction station examinations during wartime. 1/ Pulmonary tuberculosis constituted about two-thirds of all tuberculosis recorded. The pulmonary type was almost equally divided between active and arrested pulmonary tuberculosis, occurring in 6.1 and 6.7 registrants per 1,000 examined, respectively. An additional 5.4 registrants per 1,000 were classified as having suspected pulmonary tuberculosis.

The recorded incidence of all forms of tuberculosis was higher among white registrants than Negroes. These findings confirm the similar situation reported in a previous Selective Service study. 2/ Numerous references in the literature seem to substantiate the greater incidence of tuberculosis among white persons although it is a well known fact that the mortality rate for this disease is much higher among Negroes than whites. These data, plus the fact that there is a slight preponderance of active tuberculosis in comparison to arrested tuberculosis in the Negro, would seem to indicate early exposure and unimpeded development of the pulmonary type of the disease.

The group of rejected registrants found to have suspected or unspecified pulmonary tuberculosis warrants further consideration and clinical study. Recheck x-rays would reveal that at least a portion of this group would be found acceptable after examination by specialists to determine the actual existence or absence of pulmonary tuberculosis.

1/ Medical Statistics Bulletin No. 2, page 26.
2/ Medical Statistics Bulletin No. 2, page 10.

Cardiovascular Defects. The incidence of cardiovascular disease in wartime was 51.0 per 1,000 registrants examined. This recorded incidence was appreciably lower than that recorded in peacetime. 1/ This difference may be largely the result of not recording functional murmurs and non-persistent hypertension in the wartime examination. Hypertension and valvular heart diseases were the most important subdivisions of this broad group of defects. Hypertension was recorded in 18.4 and valvular heart disease in 12.9 registrants per 1,000 examined.

The incidence of cardiovascular defects among Negro registrants exceeded the incidence for white registrants, being 57.7 and 49.8 per 1,000 respectively. Hypertension was particularly prevalent among the Negroes and accounted for most of the difference between the two races. In the case of valvular heart disease and cardiac hypertrophy the incidence among Negroes was slightly greater than that for white registrants. Other types of cardiovascular defects showed a lower incidence among the Negroes than the white registrants.

The figures for rheumatic heart disease represent an understatement of the true incidence since the end-result of the disease and not the etiology was often recorded.

Blood and blood-forming organs. This group of defects had an incidence of less than one case per 1,000 registrants examined. The incidence of the group in the Negro race was negligible.

Hernia. Hernia occurred in 52.1 white and 40.2 Negro registrants per 1,000 examined. Inguinal hernia was the most prevalent type in both races, but abdominal hernia was twice as frequent among Negro as white registrants.

Kidneys and urinary system. This group of defects occurred in 11.5 registrants per 1,000 examined. In most cases the recorded defect was based upon laboratory findings with no specific diagnosis being made. Nephritis and other specific diagnosis of kidney and urinary pathology were made in only 4.7 cases per 1,000 examined. The incidence of this group of defects in the Negro race was appreciably less than in the white race (7.2 for Negroes and 12.3 for white registrants per 1,000 examinations).

Abdominal viscera. This type of defect was present in about 11 registrants per 1,000 examined and is almost equally divided between gastric ulcer and other gastrointestinal defects. It is noteworthy, however, that gastric ulcer was more prevalent among the white than among the Negro registrants and that among the Negroes this defect was less prevalent than other gastrointestinal defects.

1/ Incidence in peacetime 83.1 per 1,000 examined. Medical Statistics Bulletin No. 2, page 27.

Genitalia. This broad group of defects was recorded in 33.7 registrants per 1,000 examined. The incidence of these defects was approximately equal for white and Negro races with varicocele the most prominent subdivision among white registrants, occurring in 17.1 cases per 1,000 examined, and miscellaneous genitalia defects the most prevalent subdivision among the Negroes, being recorded in 20.9 cases per 1,000 examined. The incidence among Negroes in all other sub-groups was appreciably less than for white registrants.

Syphilis. The incidence of this defect as found in this study is significantly higher than that previously reported. During the period covered by this report 50.2 registrants per 1,000 examined were found to have syphilis; the rate for white registrants being 20.8 and for Negroes 214.7. The diagnosis in both races was predominantly on the basis of positive serology with no specified classification being made as to the stage of the disease. All forms of syphilis except neurosyphilis occurred approximately ten times as frequently among Negro as among white registrants. In the case of neurosyphilis the ratio of incidence between the Negro and white registrants was 1 to 4. Complications of syphilis, such as neurosyphilis and cardiovascular syphilis, were recorded infrequently among registrants examined. Neurosyphilis occurred in 1.8 registrants and cardiovascular syphilis in 0.2 registrants per 1,000 examined.

Gonococcus Infection and Other Venereal Diseases. The incidence of other groups of venereal diseases was 6.3 per 1,000 with the rate for white registrants 2.3 and for Negro registrants 28.7. This group was largely made up of gonococcus infections which were found in 5.9 registrants per 1,000 examined. The incidence for white registrants was 2.2 and for Negroes 26.6. Other types of venereal infection were insignificant when compared with syphilis and gonorrhea.

Skin. This group of diseases was numerous and it is probable that not all cases diagnosed were reported. The group had very little importance as a cause for rejection and was of only minor importance as a recorded defect. It occurred in 14.0 cases per 1,000 examined, being recorded twice as frequently among white as Negro registrants.

Hemorrhoids and Other Rectal Defects. This group of defects was found in 11.3 registrants per 1,000 examined, with the figures for white registrants 11.6 and for Negroes 9.1. The frequency of this defect among examined registrants indicates it to be relatively unimportant in comparison with other defects.

Varicose Veins. Varicose veins occurred in 16.2 cases per 1,000 registrants examined with a prevalency among white registrants of 17.3 and among Negroes of 9.7. It is not a principal defect in most instances and unless ulcerated is usually not a cause for rejection.

Illiteracy and Mental Deficiency. It has never been possible to clearly separate registrants found illiterate from those who are mentally deficient. There is considerable overlapping in these two categories with illiterate registrants being recorded under both. This has been especially true since June 1, 1943 when illiteracy per se was no longer considered a cause for rejection. The fact remains that if either of these defects is recorded it is more than likely that the registrant will be rejected for service. This group of defects was recorded for 50.7 registrants per 1,000; 36.8 for white registrants and 128.2 for Negroes. Only a small portion of the group was comprised of morons, imbeciles and idiots. The main portion is composed of those registrants who were educationally or mentally deficient. Serious mental deficiency (morons, imbeciles, and idiots) occurred in 6.2 cases per 1,000 registrants examined. The incidence of this defect was only slightly greater among Negro than white registrants. However, educational deficiency showed a wider race discrepancy, with the ratio of incidence between white and Negro being 1 to 4. The same ratio applied to "mental deficiency unspecified" where the recorded rate for white registrants was 9.0 and for Negroes 35.3 per 1,000 examined.

Mental Disease. This group of diseases was one of the leading causes for rejection and one of the most important defect groups recorded. Mental disease was recorded for 67.5 registrants per 1,000 examined, with an incidence of 70.6 for white and 50.3 for Negro registrants. Psychoneurotic disorders, psychopathic personality, and grave mental or personality disorders led the list as subdivisions of this group, occurring in 60.8 per 1,000 registrants examined. The incidence of psychopathic personality was higher among Negroes than white registrants. In the case of all other types of mental disease the recorded rate among Negroes was appreciably lower than for white registrants.

Neurological Defects. Neurological defects were recorded more frequently for white registrants than Negroes, the incidence being 29.6 for white and 19.0 for Negro registrants. The largest specific subdivisions of this group were epilepsy, post-traumatic cerebral syndrome and residuals of poliomyelitis. The miscellaneous group of neurological defects constituted 11.9 recorded cases per 1,000 registrants examined, and while this group forms the most important subdivision within the group, it has so many component parts that other headings actually carry more importance. In the case of post-traumatic cerebral syndrome the incidence among Negroes exceeded that for white registrants.

Musculoskeletal. The incidence of musculoskeletal defects was 86.1 per 1,000 registrants examined; for white registrants it was 90.8 and for Negroes 59.6. Residuals of injury were the most frequently recorded musculoskeletal defect, occurring in 26.0 instances per 1,000 registrants examined. This category included, for the most part, disqualifying disabilities resulting from injuries, such as the limitation of motion of a joint and deformities resulting from fractures. The hands, knees, and elbows were most frequently affected. Amputations ranked second among the subdivisions of this group occurring in 10.2 cases per 1,000 examined, with spinal malformations (scoliosis, lordosis, and kyphosis) ranking third with an incidence of 10.0. Miscellaneous musculoskeletal defects, including the congenital ones, were of utmost importance and reached nearly the same incidence as residuals of injury, occurring in 25.1 cases per 1,000 examined.

Feet. Defects of the feet continued to be an important recorded defect although they became relatively unimportant as a cause for rejection. Pes planus (flat feet) predominated in this grou. of defects, occurring in 48.3 out of a total of 54.6 feet defects per 1,000 registrants examined. The occurrence of pes planus was equal in both white and Negro registrants but was more frequently a cause for rejection among Negroes.

Endocrine Disturbances. This group of defects was recorded in 8.5 cases (9.6 for white and 2.5 for Negroes) per 1,000 examined. Diabetes mellitus, Frohlich's syndrome, and thyroid disturbances formed the bulk of the group and all three had approximately the same recorded incidence. Goiter, which commanded so much attention in World War I, has been recorded rather infrequently in the current war and the definite "goiter belt", which was so easily determined from the results of the examinations in World War I, no longer exists. The addition of iodine to the diet in the susceptible areas has been largely responsible for this change.

Neoplasms. This group of defects was recorded 9.4 times per 1,000 registrants examined. The group included pilonidal cysts which occurred in 4.5 registrants per 1,000 examined. Other neoplasms were also a sizable subdivision under this heading. They are responsible for a very large share of the neoplasms recorded for Negroes among whom pilonidal cyst is not prevalent to any great degree. The occurrence of malignant growths was negligible as would be expected from the age composition of the group examined. The overall incidence of neoplasms was over two times as great among white registrants as Negroes.

Infectious, Parasitic, and Epidemic Diseases. This group is not frequently recorded as a defect since registrants with acute infections or epidemic diseases are not normally examined until their acute condition improves.

Other Defects. This group included a wide variety of specific defects and the sum total of all of these defects constituted an incidence of 72.5 per 1,000 registrants examined. Thus this non-distinct group became one of the largest of the recorded defect groups. The overall incidence of the group was 77.4 for white and 45.1 for Negroes in every 1,000 examined. Overweight and underweight constituted the most important sub-group under this major heading, overweight being recorded twice as frequently as underweight. Defects of weight were a little more than half as prevalent among Negroes as white registrants.

STATE AND REGIONAL DIFFERENCES IN RESULTS OF PHYSICAL EXAMINATION

The data presented in the preceding sections present an overall picture of the national situation in regard to examined registrants but do not necessarily portray the situations in the individual states. Actually, of course, certain states vary considerably from others in matters of health just as they do in other characteristics such as wealth, economic activity, racial composition, and education. It is the purpose of this section to consider briefly some of the more important state and area differences in rejection rates, physical defects, and principal causes for rejection.

Rejection Rates

Table 1 in Appendix D presents state rejection rates for February 1943-August 1943. Separate rejection rates are calculated for local board examinations, induction station examinations, and for local board and induction station examinations combined. The combined local board and induction station rejection rates for all races indicate that all of the thirteen southern states were above the national average, but of the thirty-five northern and western states, only Vermont, Colorado, and New Mexico were above the national average. The lowest rejection rates were found in the northwest. On the other hand, over 50 percent of all registrants examined were rejected in seven states, all of which were located in the south. (See Figure 4).

A comparison of Figures 4 and 5 reveals that rejection rates for white registrants were highest in the southern states and in Colorado and Vermont. The lowest rejection rate for white registrants occurred in Kansas, Delaware, New Jersey, and in the northwest section of the country. The actual rates varied from 25 percent in Oregon to almost 50 percent in North Carolina.

Negro rejection rates were not calculated for states having less than 0.3 percent of total Negro registrants. The rejection rate for Negroes was higher than for white registrants in all states. In 17 states it exceeded 50 percent of the men examined while in an additional 11 states it exceeded 40 percent. Only in Kansas was the Negro rejection rate less than 35 percent (33.4). These extremely high rejection rates among Negroes played a important role in the high total rejection rates for the southern states. The rejection rates for Negroes varied from more than 71 percent in North Carolina and Arkansas to 33.4 percent in Kansas. (See Figure 6).

EXAMINED BY STATES

FEBRUARY 1943 - AUGUST 1943

NEGROES 1/

United States Average

Negro 56.9

1/ Negro rates are not calculated for states having less than 0.3 percent of total Negro registrants.

The differences in rejection rates in the various states are the result of several factors operating simultaneously. First, there are actual differences in the health of individuals in the various sections of the country. This is probably the primary reason for the variation in rejection rates between states and areas. The actual differences in the health of the people may be the result of environment, climate, economic status, and the availability of medical care. Secondly, standards of examination and acceptability may be applied differently in the various areas. This should not occur but cannot be completely eliminated when human judgment is involved in interpreting standards which cannot be measured objectively. Finally, the type of registrant forwarded for examination in one state may not correspond to the type being forwarded from another state. Some areas have more registrants deferred than others. Therefore differences in rejection rates between states are applicable to the specific period in question and not to all periods or all registrants. The general trends by race and areas, however, should be representative of total conditions.

"No Defect" Rates

The proportion of registrants with no defects, as discussed in this section, includes registrants who had no defects and those whose defects were of insufficient importance to be recorded in the physician's summary of defects on the Form 221. For rejected men, at least one defect was always recorded in the summary, but for inducted men this was not always done.

As Table 11 shows, 36.9 percent of the registrants examined during 1942 and 1943 had no defects recorded; the figure was 38.0 for white and 30.5 for Negroes.

Table 11
Percent of Examined Registrants Who Had No Defects
April 1942-December 1943

Race	April 1942-December 1943	April 1942-March 1943	April 1943-December 1943
Total	36.9	36.0	38.6
White 1/	38.0	36.8	40.3
Negro	30.5	31.3	29.1

1/ Includes all races other than Negro.

The percent of white registrants with no defect was higher during April 1943-December 1943 than in the preceding period; that of Negroes was lower. The discussion in this section is limited to April 1942-March 1943, the period for which detailed data are available.

Table 12 shows the proportion of registrants in the various age groups who were examined during April 1942-March 1943 and who had no defects recorded. With increasing age, the proportion of registrants with no defects increased. A smaller percentage of Negroes than of whites had no defects; this was true for each of the age groups.

Table 12
Percent of Examined Registrants for Whom No Defects Were Recorded, by Age Group, April 1942-March 1943

Race	Age Group				
	18-44	18-24	25-29	30-37	38-44
Total	36.0	45.3	33.4	28.1	20.3
White 1/	36.8	45.8	34.0	29.0	21.0
Negro	31.3	41.4	30.3	24.0	15.4

1/ Includes all races other than Negro.

The no-defect rates for individual states are presented in Table 2, Appendix D, by race and age group, and in Figures 7, 8, and 9. The states varied a great deal in the proportion of men with no defects. Among white registrants aged 18-44, there was a range of one percent in Vermont to 59 percent in Kansas. For Negro registrants, it was 2.6 percent in Massachusetts and 56.6 percent in Kansas.

The marked variation between states is due in large part to variations in diagnosis or in summarizing the defects recorded on the Form 221. In some states, only disqualifying defects of rejected men and the more serious defects of inducted men were recorded in the summary; in others defects of minor importance were also summarized. The extremely small proportion of registrants who were free from defects in the New England States reflects the policy of summarizing minor as well as major defects. This practice was apparently not followed in many of the states which had high rejection rates but which also showed a high proportion of registrants with no defects. Examples of the latter are Florida, Alabama, and Mississippi, whose rejection rates were above the national average, and whose no-defect rates were lower than would be expected.

Ten Leading Causes for Rejection by States

Table 4 in Appendix D presents the individual state rejection rates per 1,000 white registrants examined for each of the ten leading causes for rejection in the United States. These data are, again, for the period April 1942 through March 1943. It is obvious that the ten leading causes for rejection in the entire United States will not be identical with the ten leading causes for rejection in the individual states. It is also obvious that various sections of the country will have different leading causes for rejection. Therefore, for purposes of this discussion the United States has been divided into four geographical regions; East, South, Midwest, and West. 1/

Table 13 compares the rank position of the ten leading causes for rejection in the United States with the rank position of these same causes for rejection in the individual states within the four geographical regions. This table applies to white registrants only. It was found that in a limited number of states defects of the abdominal viscera, teeth, genitalia, and mental deficiency were among the ten leading causes for rejection even though these defects were not among the first ten causes for rejection in the nation as a whole. The table indicates that the eighth, ninth, and tenth causes for rejection in the United States, namely: educational deficiency, tuberculosis, and syphilis held a rank position of eleventh or greater in some of the individual states. Regional differences in this respect are discussed in the following paragraphs.

In the East it is noticeable that cardiovascular defects seemed to be responsible for more rejections than in the other areas as evidenced by their higher rank position in the area. Musculoskeletal defects, on the other hand, generally ranked lower among the states in this region than they did in the nation as a whole. Hernia and neurological defects were the cause of a slightly smaller proportion of rejections in this area while defects of the ears were relatively more important in the East than in the nation as a whole. The importance of defects of the eyes as a cause for rejection in the states in this area varied widely with this defect ranking as the first cause for rejection in one state and the seventh cause for rejection in another. The table also indicates that educational deficiency and syphilis were not generally among the ten leading causes for rejection in the individual states within this region and that their corresponding rank in the nation was taken over by other defects such as mental deficiency and defects of the abdominal viscera.

1/ See Table 3 in Appendix D, for the list of states comprising each region.

In the Midwest hernia generally carried a higher rank position as a cause for rejection than in the nation. Cardiovascular defects on the other hand, were responsible for a smaller proportion of rejections than in the entire nation as is indicated by the lower rank position of this defect in most states in this area. Educational deficiency was relatively unimportant in the states in this region and in only three of the thirteen states did this cause rank in the first ten causes for rejection. In nearly half of the states in this area syphilis was not among the first ten causes for rejection of white registrants. Mental deficiency, dental defects, and defects of the abdominal viscera assumed importance as leading causes for rejection in individual states in this region even though they were not among the first ten causes for rejection in the nation.

In the South educational deficiency and syphilis generally held higher rank as causes for rejection in the individual states than is true for white registrants in other areas. On the other hand, tuberculosis, neurological defects, cardiovascular defects and ear defects formed a smaller proportion of rejections in these states than in the entire United States. It is also noticeable that cardiovascular defects had a low rank position as a cause for rejection in several states in this area in comparison to all the states in the country. It is quite obvious that the prevalence of educational deficiency and syphilis among white registrants in the southern states influenced the other causes for rejection considerably in this area.

More states in the West showed musculoskeletal defects as the leading cause for rejection than was true for any other area of the nation. Mental disease was relatively unimportant as a cause for rejection in the states in this area as compared to states in other regions. Hernia, eye defects, and syphilis were relatively more important as causes for rejection of white registrants in the states in this region than in the nation. The region failed to establish a clear-cut pattern of leading causes for rejection. All but four of the ten leading causes for rejection in the nation were recorded as the first cause for rejection in at least one state in this area. The dispersion of the ten leading causes for rejection of white registrants in the nation in comparison with their rank position in the states within the region indicates that mental disease ranked from first in one state to eleventh in another. Musculoskeletal defects varied from the most important cause for rejection in five states to the fourth most important cause in two states. Cardiovascular defects carried a rank position from first to ninth in the states in this region; hernia ranks from second to eighth; eye defects from first to fifth; and neurological defects from third to twelfth. Educational deficiency predominantly ranked tenth or higher as a cause for rejection in these states. Tuberculosis was the leading cause for rejection in one state and was the sixteenth or higher cause for rejection in one state in this area. Syphilis varied from the second to the twelfth cause for rejection in the states in this region.

1369

Table 14, which presents similar data for Negro registrants, has been confined to two groups: one comprising the 13 southern states and the other all other states for which Negro rates were calculated. 1/ Table 5 in Appendix D presents the individual state rejection rates per 1,000 Negro registrants examined for each of the ten leading causes for rejection in the United States. No clear-cut rejection rate trends would be expected among the states outside the South since they are located in all sections of the United States. The individual states in this group should reflect the conditions existing in the region in which they are located.

It is noticeable that cardiovascular and eye defects as well as mental deficiency held less importance as causes for rejection among Negroes in the southern states than was true for Negroes in the nation as a whole. Gonorrhea, on the other hand, was relatively more important as a cause for rejection in the states in this area than in the entire nation. Syphilis was the leading cause for rejection among Negro registrants in all but two southern states.

Outside the South, mental disease, eye defects and neurological defects frequently ranked higher than in the nation. On the other hand, educational deficiency was the second cause for rejection in one of this group of states, but ranked as low as the ninth cause for rejection in four states in the group.

1/ Negro rates were not calculated for states having less than 0.3 percent of all Negro registrants.

PREPARATION OF THE REPORT OF PHYSICAL EXAMINATION AND INDUCTION (FORM 221)

A Report of Physical Examination and Induction (Form 221) was prepared by the local board clerk for each registrant ordered to report for a local board physical examination (screening type). For reference purposes a completed sample of Form 221 appears at the end of this appendix.

Section I of the form was prepared by the clerk at the local board prior to the time the registrant appeared for "screening examination". This section contained identifying and general information concerning the registrant, such as: name, local board, order number, birthdate, address, race, education, marital-dependency status, occupation and employment status. This information was transcribed to Form 221 from the registrant's Classification Questionnaire (Form 40) and any subsequent information appearing in the registrant's Cover Sheet (Form 53).

The local board examining physician completed Section II of Form 221 at the time of the "screening examination". This section contained (a) a description of the defects claimed by the registrant, (b) remarks by the examiner as to the general physical condition of the registrant, (c) the recording of any specific defects diagnosed which appeared on the List of Defects (Form 220), and (d) the result of the serological test for syphilis. The examiner secured a blood sample for the latter test and the results were entered in the Form 221 at a later date.

Item 27 of Section II was completed by the local board after the "screening examination". A registrant found to have a defect appearing on the List of Defects (Form 220) might be classified in Class IV-F. Most registrants who passed this preliminary examination were forwarded to the induction station for a complete physical examination by the armed forces.

The results of the examination by the armed forces were recorded on pages 3 and 4 and included a summary of defects in the order of importance, the decision as to the acceptability of the registrant and the cause for rejection, if the registrant was not accepted. The Form 221 was then returned to the local board in order to record the registrant's reclassification as the result of the induction station examination. One copy of Form 221 was later transmitted to National Headquarters, Selective Service System. This copy was coded and tabulations were prepared from the punch cards.

1311

Codes and Coding Instructions

Codes were established for the transcription of most of the information appearing on the Form 221 to punch cards. These codes included the socio-economic data as well as the medical information. The broad outline of the medical defect code was largely based upon the Army Regulations (Mobilization Regulations 1-9) which prescribe the standards for men entering the military service. The code utilized broad defect groups, each group containing several subdivisions. The data in this bulletin are confined to 100-rubric detailed classifications in order to make the data comparable for the entire period covered by the study. 1/

There were slight differences in the coding of defects after September 1943 in comparison to the coding prior to that time. Through September 1943 the defects listed in item 78 of Form 221 and in items 58 and 59 of Form 221 (January 30, 1942) were coded for registrants examined at induction stations. The first defect listed in item 78 was termed the principal defect and was listed on the first defect card. Additional defect cards were prepared for the other defects listed in items 78, 59 and 58. Instructions provided, however, that no more than one defect would be coded for each broad defect group and a priority system was provided to aid in coding multiple defects within the same group. 2/ The defects mentioned in items 58 and 59 for accepted registrants were also coded.

For registrants rejected after local board examination the principal defect was the first defect listed in item 26 (a), and the medical defects recorded in items 26 and 25 were coded and transferred to additional cards.

After September 1943 the processing of Forms 221 was taken over by the Surgeon General's Office and a different punch card was used which provided for the coding of three defects on a single punch card and a maximum of three defects were coded for examinations processed after that date. In general, the source of the defects recorded remained the same and a similar system of priority within defect groups continued to be used.

1/ See Alphabetical and Numerical Indexes to Abridged Medical Defect Code, Selective Service System.

2/ Detailed information on the coding and tabulating of data from Forms 200 may be found in "Methods Used in Processing Data from the Physical Examination Reports of the Selective Service System". (Thomas I. Edwards and Louis P. Hellman, Journal of the American Statistical Association, June 1944, Vol. 39, pp 165-182.)

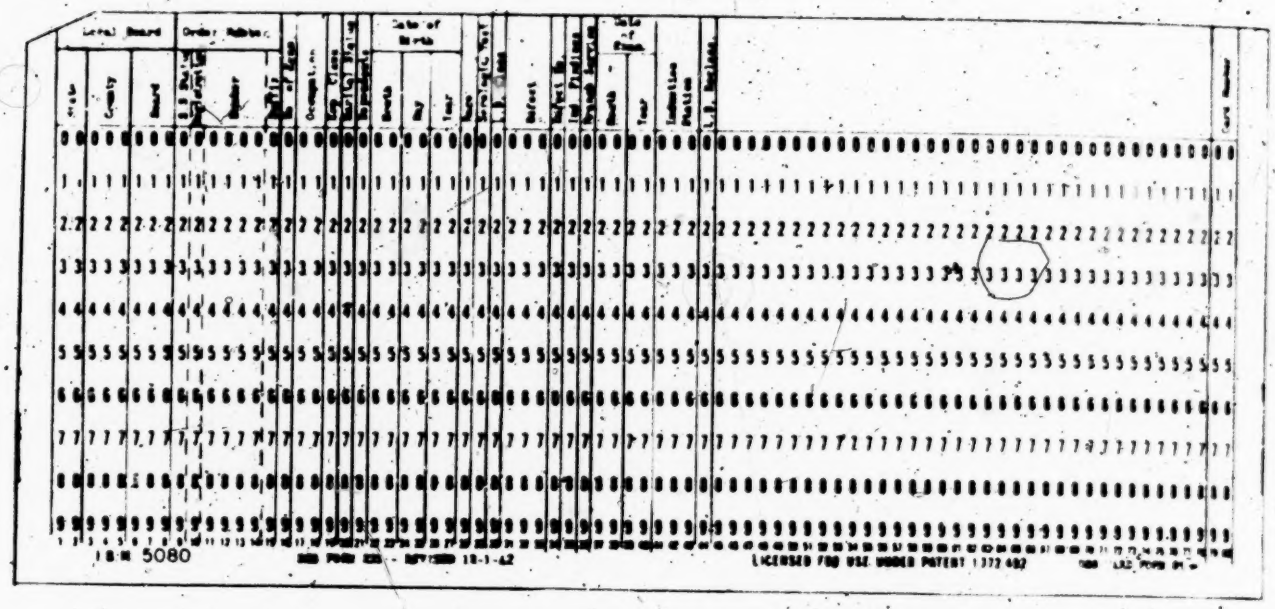

Figure 10. Punch Card Used for Processing Forms 221 During the Period April 1942 through September 1943

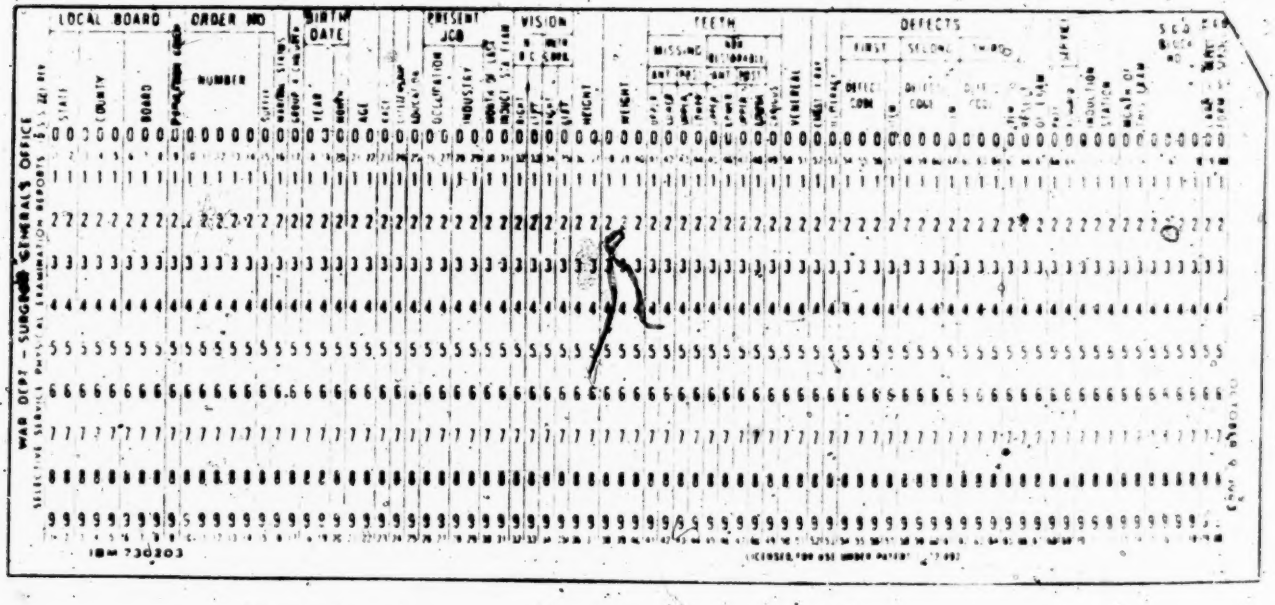

Figure 11. Punch Card Used for Processing Forms 221 During November and December 1943

Punch Cards

Figure 10 is a sample of the punch card used for processing Forms 221 through September 1943. The separate punch cards prepared for each defect contained identical information except in the defect columns and that in which the defect number was punched—as first, second, third defect, etc.

Figure 11 shows the punch card used by the Surgeon General's Office after September 1943 which provided for the coding of 3 defects upon 1 card. In addition this punch card provided for considerably more information as to specific measurements of vision, the number of missing and non-restorable teeth, and data as to height and weight. The socio-economic data was also expanded to include not only occupation but industry as well.

Sampling Procedure

Two methods of sampling were used during the time period covered by this study. Through September 1943 the samples were based upon the month in which the Report of Physical Examination and Induction was received in National Headquarters. The number of forms selected for the sample depended to a great extent upon the facilities for processing the forms. Forms were selected at random, depending upon the size of the sample desired. If a 25-percent sample was desired every fourth form was selected for coding and processing. Similarly if a 20-percent sample was desired every fifth form was selected, coded, and processed.

The selection of the sample after September 1943 was based upon the month in which the examination occurred. The sample was selected by withdrawing from the shipments the forms for registrants whose order numbers ended in 7 if a 10-percent sample was desired or the forms for registrants whose order numbers ended in 4 and 7 if a 20-percent sample was desired.

The size of the sample selected for study varied from month to month. The samples selected for analysis were as follows: April 1942-July 1942, 100 percent; November 1942, 12½ percent; December 1942-May 1943, 25 percent; June 1943-September 1943, 16 2/3 percent; November-December 1943, 10 percent.

INSTRUCTIONS

1. An original and three copies of this form will be prepared for each registrant called up for physical examination. The original is designated as the Armed Forces' Original; the first carbon copy, the National Headquarters' Copy; the second carbon copy, the Surgeon General's (Army)—Bureau of Medicine and Surgery (Navy)—Commandant Marine Corps (M. C.) Copy; and the third carbon copy, the Local Board's Copy. Instructions are contained on each copy.
2. Forms of men rejected by the armed forces will be marked "Rejected by the Armed Forces" in large letters at the top of page 1.
3. If the registrant is not sent to the induction station of the armed forces, or is rejected by the induction station of the armed forces, this original will be filed, along with "Local Board's Copy" (3d copy), in the registrant's Cover Sheet (Form 53).
4. For registrants accepted by the induction station of the armed forces: If inducted by the ARMY, this original accompanied by F. B. I. Military Fingerprint Card will be forwarded from induction station to The Adjutant General, Washington, D. C.; if inducted by the NAVY or COAST GUARD, this original will be forwarded through the Main Recruiting Station to the Bureau of Navigation, Washington, D. C.; if inducted by the MARINE CORPS, this original will be sent to the Commandant, Headquarters, U. S. Marine Corps, Washington, D. C.
5. Fingerprints are required only on this original and only for registrants who are inducted. If inducted by ARMY, prepare F. B. I. Military Fingerprint Card.

SECTION II.—REPORT OF LOCAL BOARD EXAMINING PHYSICIAN AND LOCAL BOARD CLASSIFICATION.

22. If registrant's answer to Item 6 above is "yes," when and for what ailment(s)

23. Is registrant now or previously an enrollee in the Civilian Conservation Corps: No ☒; Yes ☐

24. Serological test (syphilis): Date 5-25-1942 Result Negative

Second serological test (syphilis): Date Result

25. Examining physician's remarks

26. (a) Do you find that the above-named registrant has any of the defects set forth in Part I of the List of Defects (Form 220)? (If in doubt, answer "no," and give details.) No (Answer yes or no) If answer is "yes," describe the defects, in order of significance

(b) Do you find that the above-named registrant has any of the defects set forth in Part II of the List of Defects (Form 220) (If in doubt, answer "no," and give details.) No (Answer yes or no) If answer is "yes," describe the defects, in order of significance

(c) I have examined the above-named registrant in accordance with Selective Service Regulations.

(d) Signature of examining physician John N. Smith

(e) Place Thornton (Town or city) Thornton (County) Maryland (State) (f) Date May 20, 1942

27. (a) This Local Board has classified the above-named registrant in Class I-A

(b) Signature of Member of Local Board E. M. Coquill

(c) Place Thornton (Town or city) Thornton (County) Maryland (State) (d) Date May 27, 1942

SECTION III.—NEAREST RELATIVE, PERSON TO BE NOTIFIED IN CASE OF EMERGENCY, AND DESIGNATION OF BENEFICIARY (To be filled out at the induction station of the armed forces for only those registrants accepted for military service.)

A. Nearest relative and person to be notified in case of emergency:

28. Nearest relative (Other than wife or minor child. Name in full)

29. Relationship 30. Address (Number and street or rural route. If none, so state) (City, town, or post office) (State or country)

31. Person to be notified in case of emergency (Name in full)

32. Relationship (If friend, so state) 33. Address (Number and street or rural route. If none, so state) (City, town, or post office) (State or country)

B. Designation of beneficiary:

34. The persons eligible to be my beneficiary are designated below:

(1) (Full name of wife; if no wife, or if she is deceased or divorced, so state) (Wife's full address)

(2) (Full name and address of each minor child and each dependent child over 21 years of age. If there are no children, so state. If the address is the same as the wife's, so state. Do not repeat address)

35. In the event of my leaving no widow or child, or their decease before payment is made, I then designate as my beneficiary the dependent relative whose name, relationship, and address are shown below:

(3) (If designation of beneficiary is declined, man must state in own handwriting: "I decline to designate any person as my beneficiary")

36. In the event of the death or disqualification of the last-named dependent relative before payment is made, I then designate as my beneficiary the dependent relative whose name, relationship, and address are shown below:

(4) (If beneficiary is named in line 35 but naming of alternate is declined, man must state in own handwriting: "I decline to designate an alternate beneficiary")

37. Signature of registrant (First name) (Middle name) (Last name)

38. Witnessed at on 19

(Signature of witness attesting) (Name of witness typed) (Grade and organization)

SECTION IV.—PHYSICAL EXAMINATION RESULTS: (All Items Must Be Filled In. Indicate Normal or None Where Applicable. To Be Filled Out by the Medical Board at the Induction Station of the Armed Forces.)

Do Not Write in This Column

39. Eye abnormalities* None

40. Ear, nose, throat abnormalities Bilateral partial deafness

41. Mouth and gum abnormalities None

42. Teeth: (a) Indicate restorable carious teeth by circling; nonrestorable carious teeth by /; missing natural teeth by X.

	Right							Examiner's							
8	(7)	X	5	X	3	2	1	X	2	3	4	/	6	X	/
16	/	14	(13)	12	11	10	9	9	10	M	M	13	14	15	(16)

(b) Remarks, including other defects None

(c) Prosthetic dental appliances None

(d) Remediable dental defects

43. Skin Clear

44. Varicose veins None

45. Hernia None

46. Hemorrhoids None

47. Genito-urinary (non-venereal) Normal

48. Venereal diseases None

49. Feet Pes Planus, First Degree

50. Musculoskeletal defects Slightly stiff right arm

51. Abdominal viscera Normal

52. Cardiovascular system Hypertrophy of the heart with loud systolic murmur

53. Lungs Normal

54. Chest X-ray Normal

55. Mental Normal

56. Nervous system Normal

57. Endocrine system

58. Other defects and/or diseases or other remarks

59. Summary of defects in order of significance Hypertrophy of the heart systolic murmur, bilateral partial deafness, stiff right arm, pes planus, poor teeth.

60. Vision, without correction:
(a) Right eye 20/20
(b) Left eye 20/20

61. Vision, with correction:
(a) Right eye 20/20
(b) Left eye 20/20

62. Color perception*

63. Hearing:
(a) Right ear 5/20
(b) Left ear 5/20

64. Height 65½ inches

65. Weight 127 pounds

66. (a) Girth, at nipples; inspiration 32½ inches
(b) Girth, at nipples; expiration 30 inches
(c) Girth, at umbilicus 29 inches

67. Posture: Good ☐ Fair ☒ Poor ☐

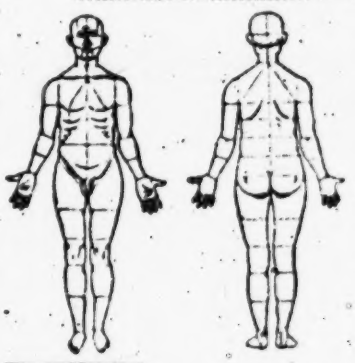
68. Frame: Heavy ☐ Med. ☐ Light ☒

69. Color of hair Brown

70. Color of eyes Brown

71. Complexion Light

72. Pulse, sitting 80



73. Pulse, after exercise*

74. Pulse, 2 minutes after exercise* 86

75. Blood pressure:
(a) Systolic 130
(b) Diastolic 82

76. Urinalysis:
(a) Specific gravity 1.024
(b) Albumin Negative
(c) Sugar Negative
(d) Microscopic*

77. Other data.

* When indicated.

SECTION IV.—PHYSICAL EXAMINATION RESULTS—Continued.

78. I CERTIFY that the above-named registrant was carefully examined, that the results of the examination have been correctly recorded on this form and that to the best of my knowledge and belief—

(a) _____ (Enter name of registrant if this subsection is applicable) is physically and mentally qualified for general military service.

(b) _____ (Enter name of registrant if this subsection is applicable) is physically and mentally qualified for general military service after the satisfactory correction of the following remediable defects: _____

This registrant would have been accepted for general military service had the remediable defects herein specified been remedied at the time of this examination.

(c) _____ (Enter name of registrant if this subsection is applicable) is physically qualified for limited military service only by reason of _____

(d) _____ (Enter name of registrant if this subsection is applicable) is physically qualified for limited military service after the satisfactory correction of the following remediable defects: _____

This registrant would have been acceptable for limited military service had the remediable defects herein specified been remedied at the time of this examination.

(e) Charles James Doe (Enter name of registrant if this subsection is applicable) is physically and/or mentally disqualified for military service by reason of hypertrophy of the heart, bilateral deafness

(f) _____ (Enter name of registrant if this subsection is applicable) is disqualified for military service because of _____

(g) Signature Thomas E. Webber *Medical Examiner.* (h) Title Major, M.C.

(i) Name typed or stamped Thomas E. Webber, Major, M.C.

79. (a) _____ (Enter name of registrant if this subsection is applicable) was this date inducted for (general, limited) [strike out inapplicable word] military service into the (fill in appropriate Servi , such as Army, Navy, Marine Corps, or Coast Guard) _____ of the United States and sent to _____

(b) Charles James Doe (Enter name of registrant if this subsection is applicable) was this date rejected for service in the (fill in appropriate service such as Army, Navy, Marine Corps, or Coast Guard) _____

(c) Place Fort Meade (d) Signature Army Gordon F. Adams of the United States.

(e) Date June 3, 1942 (f) Name typed or stamped Gordon F. Adams, Colonel, Infantry (Grade and organization)

SECTION V—LOCAL BOARD CHANGE IN CLASSIFICATION AFTER EXAMINATION BY THE INDUCTION STATION, OF THE ARMED FORCES.

80. (a) Based on the entries in (a), (c), (d), (e), or (f) of Item 78, above, the Local Board has changed the above-named registrant's classification to Class IV-F.

(b) Based on the entries in (b) of Item 78, above, the Local Board has retained the above-named registrant in Class _____

(c) Place Thornton, Maryland (d) Date June 15, 1942

(e) Signature of member of local board _____

METHODS USED IN COMPUTING COMBINED LOCAL BOARD AND INDUCTION STATION REJECTION RATES

The combined local board and induction station rejection ates were calculated on the following basis:

1. If one hundred registrants are ordered to report for ocal board examination, it follows that:

a. If 10 percent are rejected at the local board, 90 out of 100 would be forwarded to the induction station;

b. If 30 percent of the 90 registrants are rejected at the induction station, then 27 registrants would be rejected at the induction station;

c. Hence, out of the original 100 registrants ordered for examination, 10 were rejected at the local board and 27 at the induction station, making a combined total of 37 out of 100 examined or a rejection rate of 37 percent.

Table 1

ABSTRACT

The years 1944 and 1945 were characterized chiefly by a growing need for young men under 26 years of age to serve in the armed forces, and an increasing scarcity of available manpower in this age group. These two facts made it necessary to restrict deferments in essential occupations, including agriculture, to reexamine many registrants who had formerly been rejected, and to accept for military service some men who were unable to meet the physical requirements for general military service. As a result, the rejection rates were higher during the final months of the war than would be expected during a period when the average age of examined men was less than 26 years.

During January 1944 through August 1945, the armed forces physically examined or reexamined some 5,767,000 registrants, of whom 2,536,800, or 44 percent, were rejected for general military service. In addition, an estimated one to two percent were rejected by local boards because of manifestly disqualifying defects.

Eighty-four percent of the registrants physically examined during the last calendar year of hostilities were examined for the first time. These were chiefly men who registered with Selective Service at age 18, and men 19-25 years of age who had never been physically examined because they held deferments in essential occupations. Less than 40 percent (37.6) of this group were rejected on preliminary, or preinduction examination.

The leading causes for all rejections during 1944--including local board rejections--were, in order of relative importance: Mental disease, accounting for 26.8 percent of all rejections; failure to meet the minimum intelligence standards, 12.8 percent; musculoskeletal defects, 8.8 percent; cardiovascular defects, 8.0 percent; hernia, 4.9 percent; ears 4.4 percent; neurological disorders, 4.1 percent; eye defects, 4.0 percent; tuberculosis, 3.4 percent; and mental deficiency, 2.6 percent. These ten defects combined accounted for 80 percent of all rejections during the year.

Tuberculosis, cardiovascular defects, and musculoskeletal defects were of greater relative importance as causes for rejection among older men than among those under 26 years of age, who were more apt to be rejected because of mental and personality disorders.

BACKGROUND OF THE DATA

This bulletin presents information on the results of physical examinations during the period January 1944 through August 1945. The data on physical and mental defects found in 1944 are based on sample studies of the Reports of Physical Examination and Induction, DSS Forms 221. Information on monthly rejection rates during 1944 and 1945 and also that on causes for rejection in the final year of the war was derived from armed forces' reports on the results of physical examination.

The selection of men for physical examination has always been a function of the Selective Service System. The physical standards for acceptability of registrants, however, have been at all times fixed by the armed forces. Until 1944, local board physicians, guided by the armed forces' standards, examined every registrant who was considered eligible for induction and rejected those who were manifestly disqualified for military service. 1/ During the period covered by this bulletin, however, local board examinations were given only to registrants who requested such examination because they claimed manifestly disqualifying defects, or who were known to possess such defects. Other registrants were forwarded to the armed forces' induction stations for preinduction examination. Those found acceptable could be returned for induction without need for reexamination if they reported within a specified time period. Thus, the armed forces' examiners made both preliminary and final determination as to acceptance of nearly all the registrants who were ordered to report for physical examination, and the data on local board rejections represent only the most serious and handicapping physical and mental defects. 2/

1/ Until August 1942, the local board physicians also rejected men who were qualified for limited service only. In 1940 and 1941, when they made the majority of the rejections, they were guided by the War Department Mobilization Regulation (MR 1-9), Standards of Physical Examination During Mobilization. Beginning in 1942, the defects for which local board physicians could reject men were contained in the "List of Defects", DSS Form 220; this list was also prescribed by the War Department. The Form 220 greatly restricted the number and types of defects for which the local board physician could reject registrants.

2/ The procedures governing the preinduction plan are outlined in Local Board Memorandum No. 178, January 6, 1944 and June 8, 1944.

The methods used in selecting registrants for physical examination during 1944 and 1945, and the effects of the acute manpower problems upon the selective process were important in their relation to physical examinations. The processes and problems governing selection are discussed briefly in the following paragraphs.

The Occupation Factor. From the beginning of Selective Service operations each registrant whose order number was reached was considered for possible deferment for other than physical or mental reasons before he was placed in a class available for physical examination. The order of the deferred classes for which he was considered varied with the changing needs for manpower both in the armed forces and in civilian production. For example, during 1940 and 1941, when no great number of men were needed in the Army, deferments on the grounds of dependency were more important than those for occupation; from 1942 on, as the war progressed, the emphasis gradually shifted to the need for deferring men in essential industry or agricultural pursuits; and by February 1944, the need for men had become so acute that dependency deferments were no longer considered except in cases where it was proved that extreme hardship and privation to dependents would result from induction. The deferment class for registrants who were essential in agriculture was retained as well as that for men considered essential to war production and the national health, safety, or interest. However, the need for younger men in the armed forces had become so great by 1944 that local boards were requested to reconsider carefully all occupational deferments of men under 26 years of age, including those in agriculture and, later in the year, to forward all the young men in the occupationally deferred classes for physical examination. 1/ Some of these registrants were probably found acceptable to the armed forces but their deferments were continued because of the essential nature of their occupation. However, on August 1, 1945, only 4.9 percent of all registrants under 26 years of age were still in occupationally deferred classes.

The Age Factor. The restrictions against occupational and agricultural deferments during the period 1944-1945 were directed primarily toward the procurement of men under 26 years of age whom the armed forces considered necessary for combat duty. Liberal interpretations were made of the requirements governing the deferment of men 26 through 37 years of age during most of 1944, but the adverse turn of events in Europe at the end of the year resulted in authorization of a stricter application of deferment qualifications for the older men, particularly those 26 through 33 years of age. 2/

Men under 26 years of age who had been occupationally deferred without having previous examinations and youths who registered as they became 18 years of age provided the only new sources of manpower available for induction during 1944 and 1945. The first of these groups had previously been depleted by withdrawal of men for induction as their reasons for deferment expired. The second group—70,000 to 75,000 men registering at 18 years of age—was smaller by some 25,000 to 30,000 each month than it would have been had youths not been permitted to enlist voluntarily at age 17.

Limited Service. During the first half of 1944, registrants were inducted for limited service on a quota basis, not exceeding five percent of the net Army call by race in any one month. Under this procedure, men were inducted for limited service from January through June. Beginning in July, however, no local board forwarded registrants for induction after they were classified as acceptable for limited service only, unless instructed to do so by the State Director of Selective Service. 3/ The effect of this change was to further restrict the pool of men who could be made available for induction. From July 1944 until June 1945, the armed forces had classified more than 95,000 men as qualified for limited service only; and when the need for men became acute during the spring of 1945, the War Department again authorized induction of men under 26 years of age in this group who met physical standards slightly lower than those required for general service, but in some respects higher than the minimum standards for limited service. 4/

1/ Local Board Memoranda Nos. 155, January 6, 1944 and May 12, 1944; telegram to all State Directors, February 26, 1944; State Director Advices Nos. 255-D, March 25, 1944; 264, April 3, 1944; 255-E, April 1 and April 15, 1944; 288, January 3, 1945.

2/ Rigid deferment policies for registrants 18-37 years of age, and especially those under 34, were prescribed in Local Board Memorandum No. 115, February 21, 1945, and amended March 24, 1945.

3/ Local Board Memorandum No. 178, June 8, 1944.

4/ Local Board Memoranda Nos. 77-E, May 23, 1945; 77-F, May 26, 1945; and State Director Advice No. 311, June 22, 1945. Men forwarded for examination pursuant to these instructions were recorded as reporting under the provisions of War Department Letter AG-PR I 327.31 (26 May 45).

Reexaminations. Since no Selective Service deferment was considered permanent, registrants who were disqualified under one set of physical standards were subject to reexamination if any of the standards were lowered. Thus, when the psychological tests were revised in June 1944, many registrants rejected for failure to pass the previous tests were sent back to armed forces' induction stations for new preinduction examinations. From 10 to 17 percent of the registrants given preinduction examination during the last five months of 1944 were men who had been previously examined.

The decision of the armed forces to accept men for "military service" over and above those inducted for "general military service" in June 1945 necessitated forwarding many men for reexamination. In the months immediately preceding this decision, only about ten percent of the registrants forwarded for preinduction physical examination had been previously examined. In June, 26 percent of the men reporting for preinduction were sent up for reexamination; in July, 35 percent; and in August, the last month of the war, 39 percent of all the men given preinduction examination had been examined before.

Throughout the entire 20-month period covered by the bulletin, other reexaminations were authorized in the hope of obtaining men for general military service. The regulations governing these are discussed in the next chapter in connection with their effect upon monthly rejection rates.

Summary of Groups Selected for Examination. As a result of the armed forces' requirements and procedures during the period January 1944-August 1945, men selected for physical examination were drawn from two groups. One group included men submitted for the first time. It consisted of youths who registered with Selective Service as they became 18 years of age and registrants with occupational or dependency deferments who were processed for immediate or potential induction. 1/ In the second group were men forwarded for reexamination in the hope that they would be acceptable to the armed forces under changed standards or procedures. The large number of youths who enlisted in the armed forces and were in service at the time they became 18 years of age are not covered by this analysis; nor does it include men in the 18-37 year age group who had volunteered for enlistment at recruiting stations prior to December 1942 when enlistments from this group were discontinued. Registrants and non-registrants commissioned direct from civilian life are likewise not covered. 2/ The rates of rejection of Selective Service registrants are therefore considerably higher than they would have been if these volunteers had been processed through the System and thus added to the number of inductions.

Physically Examined Men as of August 1, 1945.

It should be emphasized that the physical examination experience described in this bulletin represents only that of the final twenty months of hostilities during World War II. The rejection rates and the relative importance of the various causes for rejection during any one period are determined largely by the administrative policies and procedures which prevailed during that period. For example, rigid physical standards, and a ban on induction of men with less than the equivalent of a fourth grade (English) education produced high rejection rates in 1940-1941; lower standards, including induction of some educationally deficient men and some with limited service defects, reduced rates of rejection during 1942-1943; and the scarcity of manpower, occasioned largely by previous enlistments of 17-year old youths, tended to raise the rates during 1944-1945. A comprehensive study of the entire experience of Selective Service would show a rate of rejection as low or lower than those for any of the separate periods, since reexaminations would not be included. Such a study is now in process of preparation.

Although the reexamination of men previously rejected had continued throughout the entire period of Selective Service operations, on August 1, 1945 there still remained some 4,828,000 registrants 18-37 years of age in the rejected classes IV-F, II-A(F), II-B(F) and II-C(F). These men comprised about one-third of all registrants examined for induction, and almost one-third of those examined for induction and for enlistment. The estimated number and percentage who had been rejected for each of thirty broad defect groups are shown in Table 4, Appendix B.

1/ In addition, during a part of the period, both non-registrant volunteers and registrants who had received certain types of discharges from the armed forces were processed for induction if circumstances indicated they were again eligible for service.

2/ A third group of men who received physical examinations during this period consisted of registrants 18-37 years of age who had been deferred because of essential occupation but had left the employment for which they were deferred without first requesting and receiving approval from their local board. Such men were known as "job-jumpers" and during January 1945-June 1945, 7,771 of these men were inducted for general military service. Their physical examinations are not included in this bulletin.

REJECTION RATES

From January 1944 through August 1945 , 44 percent of all the registrants who were physically examined by the armed forces were rejected for general service either upon preinduction physical examination or upon the time they reported for induction (Table 1). The rate of rejection for white registrants was 41.3 percent, that for Negroes, 62.7 percent. 1/

In view of the increasing number of registrants under 26 years of age who were physically examined , a rate of 44 percent was unexpectedly high. Previous Selective Service experience had shown that rejections tended to decrease as age decreased. Several factors, however , counterbalanced the reduction in rates which would normally have occurred as the average age of the examined men was lowered.

Table 1. Rejection Rates per 100 Registrants Physically Examined by the Armed Forces

January 1944-August 1945

Time Period	Rate per 100 Examined		
	All Races	White 1/	Negro
January 1944-August 1945	44.0	41.3	62.7
January 1944-December 1944	43.4	40.3	64.0
January 1945-August 1945	45.0	43.2	59.8

1/ Includes all races other than Negro.

Factors Involved. In the first place , as Selective Service was required to depend more on registrants under 26 years of age to meet monthly calls it became evident that from the ranks of the men registering as 18 year olds there had been lost many of the most physically fit through voluntary enlistment at age 17. The depletion in this group was sufficiently serious that among the 18 year old registrants the rejection rates in this period approached 40 percent. Also many of the younger men among occupationally deferred registrants of the 18-25 age group had been withdrawn previously as their qualification for deferment expired. Most of this group now submitted for reexamination had been previously rejected. 2/

These factors , in addition to the existence of physical and mental standards for military service which are higher than those necessary for useful civilian life , resulted in rejection rates which were not necessarily indexes to the physical fitness of the total population group. Nevertheless , the fact that so large a percentage of the young men examined could not meet the military standard indicates a real and definite need for preventive and corrective measures to improve the general health and physical fitness of the Nation.

The increase in rate during 1945 as compared to that for 1944 was slight , but it reflected the growing scarcity of manpower and the higher rejections attendant upon the reexamination of white registrants who had previously been rejected or classified as capable of performing limited service duty only. The Negro rates actually decreased during the last few months of the war. The greater proportion of their reexaminations had occurred during the last three months of 1944 and the first two months of 1945.

Rejection Rates By Month.

The monthly rejection rates during 1944 and 1945 reflect , to a greater degree than in any previous period , the changes in the policies of the armed forces and in the application of physical and mental standards. This was true because the changes of this period were more closely related than before to obtaining men for physical examination and induction. There were no large pools of eligible white registrants and as groups were made available under special regulations of Selective Service they were immediately processed for induction to aid in meeting monthly calls.

The rates of rejection for all races and those for each major type of cause for rejection are shown by month in Table 2. 4/ These rates decreased from a peak of 47.1 in February 1944, the first month in which the preinduction examination was in full operation , to a low point of 37.3 percent of the registrants who were examined in May. The decrease resulted primarily from the forwarding of large numbers of men for preinduction examination, particularly those under 26 years of age.

1/ During this period , the local boards rejected only those registrants with substantiated claims of defects which were manifestly disqualifying for any form of military service , and their rejections are estimated at one to two percent of all men who were ordered for preinduction physical examination.

2/ During 1944 and 1945 , men who were physically examined were 18 through 37 years of age, with increasing emphasis laid upon the need for men under 26 years of age. In 1942 and 1943 , however , the age limits had been 18 through 44 years.

3/ The composition of the different groups physically examined by the armed forces during each of the months August 1944-August 1945 is shown in Tables 5 and 6, Appendix C.

4/ The method used in computing combined preinduction and induction rejection rates is described in Appendix C.

Table 2. Rejection Rates for Physical and Mental Defects Per 100 Registrants Given Preinduction and Induction Examinations, by Month

All Races
January 1944-August 1945

Month and Year of Examination	Rejections per 100 Examined			
	Total	Physical Defects 1/	Mental Defects	
			Mental Deficiency 2/	Mental Disease
1944				
January	46.5	26.2	6.5	13.8
February	47.1	28.1	6.0	13.0
March	43.2	26.2	5.5	11.5
April	37.9	22.6	5.1	10.2
May	37.3	21.4	6.2	9.7
June	39.6	19.5	10.8	9.3
July	43.4	21.4	11.1	10.9
August	45.1	23.1	10.0	12.0
September	47.8	25.0	9.0	13.8
October	51.5	25.1	9.6	16.8
November	53.2	26.3	8.1	18.8
December	50.0	25.3	8.0	16.7
1945				
January	43.8	24.0	7.0	12.8
February	42.3	23.2	7.2	11.9
March	40.9	23.6	6.2	11.1
April	41.8	25.6	6.0	10.2
May	42.2	26.0	6.0	10.2
June	49.4	28.7	7.7	13.0
July	54.1	30.9	8.8	14.4
August	58.6	34.1	8.4	16.1

1/ Includes registrants found acceptable for limited service but not inducted; these were rejected for administrative reasons. A small proportion of other administrative rejections also appears in this group, but they amounted to less than 1 percent of the total rejections.

2/ Includes those failing to meet minimum intelligence standards as well as morons, imbeciles, idiots, and mental deficiency not specified as to type or degree.

An increase in rejection rates which began in June 1944 and reached 53.2 percent of all examined in November of that year, had three main factors as a basis. The initial increases in June and July occurred with the adoption by the armed forces of the revised mental test, whose purpose was to better determine which men with borderline intelligence should be accepted and which should be rejected. The higher passing score required for the basic test, however, created more borderline cases upon which decisions had to be made. Also, local boards forwarded for reexamination many registrants who they hoped would qualify under the new psychological testing procedure and the rejection rate for this group ran very high. 1/

A second reason for the increased rates was the fact that, while heavy preinduction examinations during the earlier months of 1944 had created a pool of acceptable men, many of these men were not forwarded for induction within ninety days and so had to undergo a complete reexamination. During the time between preinduction examination and reporting for induction, some of the physical and mental standards had been changed and many of the previously acceptable men could no longer qualify for induction. 2/ In addition, a relatively small proportion of the registrants had incurred injuries or contracted or developed diseases which rendered them unfit for military service.

The third factor which contributed to the higher rejection rates from August through November 1944 was the increasingly strict interpretation of the physical and mental standards as the armed forces required fewer replacements than they had anticipated after the invasion of Europe. The monthly calls upon Selective Service were for fewer men, and so more time was afforded for each examination. This was immediately reflected in higher rejection rates, particularly those for psychiatric defects. The rapid rise in total rates to more than 50 percent in the fall of 1944 became a matter of such concern that the problem was given special attention by the War and the Navy Departments. The lower rejection rates during

1/ The reexamination of registrants previously rejected solely because of educational deficiency or failure to pass the psychological tests was authorized in Local Board Memorandum 77-B, July 27, 1944.

2/ A revised edition of the War Department MR 1-9, Standards of Physical Examination During Mobilization, was issued on April 19, 1944. Eye standards and those relating to other defects which did not involve acceptance of large numbers of registrants were revised by Changes No. 2, MR 1-9, September 8, 1944.

the next few months were due both to more liberal interpretation of standards and to the more urgent need for manpower in the armed forces after the disastrous "Battle of the Bulge" in December of that year. In March 1945, the rejection rate was 40.9 as compared to 50.0 percent in the previous December in spite of the fact that men 26 through 33 years of age had again been designated by the armed forces as acceptable and a number of them had been physically examined or reexamined.

An increase in rejection rates began with 42 percent in April 1945 and reached 59 percent in August. The greatest single contributing factor was the acute scarcity of manpower which made necessary the reexamination of men who might qualify for military service under standards lower than those required for general service.

Physical Defects. The fluctuations in rejection rates for physical defects did not follow closely those for all defects. The decrease from 28.1 percent in February 1944 to 21.4 percent in May corresponded somewhat to the decrease in the total rate, but the rise in monthly rates during the latter half of 1944 was reflected less in physical than in mental causes for rejection. The rates for physical defects in this period reached a peak of 26.3 percent in November, decreased to 23.2 percent in February 1945, and rose steadily thereafter to a high point of 34.1 percent of the registrants examined during August. The February-August increase in rates for physical defects resulted primarily from reexamination of men over 26 years of age and those who were selected from the former limited service group for possible induction under the special standards prescribed for less than general service, or "military service." Selection of men under less than general service standards was made largely from those who had been classified as acceptable for limited service because of physical rather than mental defects. 1/

Mental Defects. The rates of rejection for mental defects closely paralleled the total rejection rates except during the first five months of 1945, when the physical rejections contributed most to the rejection picture. In May 1944, the mental defect rate (mental deficiency and mental disease combined) was 15.9; in June it increased to 20.1 and in November had reached a peak of 26.9 rejections per 100 registrants examined. There was a gradual decrease to 16.2 percent in May 1945, but the rate increased in June and was 24.5 (representing the rejection of almost one-fourth of all examined men because of mental defects) during the final month of the war.

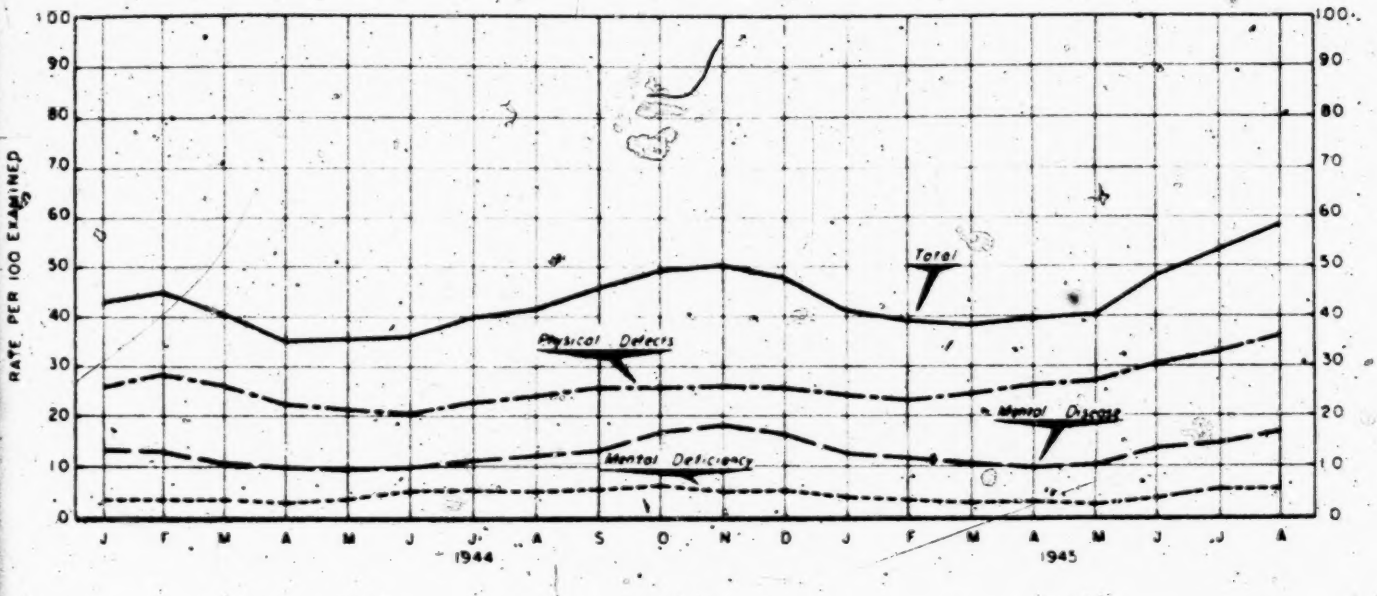
Mental deficiency rates were characterised chiefly by marked upward changes in June of each year. The rise from 6.2 percent in May 1944 to 10.8 in June followed the use of the new mental tests, with the higher basic passing score and the reexamination of men rejected for failure to pass the previous tests. During July 1944, the mental deficiency rate was 11.1, and from that point decreased to 6.0 by May 1945, when it rose again, reaching 8.4 percent in August as the War Department began carrying out plans to discontinue its special training units for illiterates.

Mental disease rejections contributed most to the total rates during the fall of 1944, when they paralleled the overall rates. The probable cause for this, as discussed in a preceding paragraph, was the fact that as monthly calls decreased because of need for fewer replacements, more time was afforded for psychiatric examinations. The rate of 9.3 in June 1944 had more than doubled in November (18.8). A psychological factor which may also have had some weight in increasing these rates was the general feeling on the part of both civilian and military personnel that the end of the European phase of the war was near. The realization that this was not true, coupled with War Department instructions for more liberal interpretation of standards, resulted in decreased rejection rates for mental disease to 10.2 per 100 examined in May 1945. This was the month of Germany's surrender. In June the total rejection rate had increased by 17 percent, while the mental disease rate was 13.0, an increase of 28 percent over that for May. By August 1945 the total rate had increased 39 percent over that for May and the mental disease rate was 58 percent higher.

White Rejection Rates. The rejection rates for white and for Negro registrants, shown in Tables 3 and 4, have been reduced to graphical representation in Figure 1. For white registrants, the trend in rejections from January 1944 through August 1945 was similar to that for all registrants. The fact that white registrants comprised almost 90 percent of all persons examined is responsible for the small difference between white rates and those for all races.

The white rejection rates rose sharply in three distinct peaks with each peak and each trough exceeding the previous one. Physical defects contributed most to the first and the third and while they rose, they were not the primary contributing factor to the second peak. Mental disease rejections rose to a record high in November 1944 and were the greatest single factor which contributed to the high total rejection for that month.

Mental deficiency rejections fluctuated less than those of the other major defect groups. They did show an appreciable rise, however, after the introduction of the new testing procedure and after many



1/ Administrative rejections are also included in Tables 2, 3, and 4 in the column of rejection rates for physical defects, since men designated as acceptable for limited service were given administrative rejections. These limited service rejections comprised almost the entire proportion of rejections for administrative reasons. Less than one percent were moral and other nonmedical rejections.

WHITE

NEGRO

registrants under 26 years of age were submitted for reexamination. This defect group ... least to the total rejection rate in each month from January 1944 through August 1945.

Table ... Rejection Rates for Physical and Mental Defects Per 100 White Registrants Given Pre-Induction and Induction Examinations, by Month 1/

January 1944-August 1945

Month and Year of Examination	Rejections per 100 Examined			
	Total	Physical Defects 2/	Mental Defects	
			Mental 3/ Deficiency	Mental Disease
1944				
January	43.5	26.2	3.5	13.8
February	45.6	28.6	3.6	13.4
March	41.3	26.4	3.5	11.4
April	35.6	22.5	3.0	10.1
May	35.0	21.6	3.8	9.6
June	36.2	20.9	5.2	10.1
July	40.1	23.0	5.4	11.7
August	41.8	24.3	5.3	12.2
September	45.6	25.9	5.8	13.9
October	49.4	25.8	6.6	17.0
November	50.8	26.3	5.7	18.8
December	48.1	25.8	5.6	16.7
1945				
January	41.9	24.6	4.3	13.0
February	39.6	23.8	3.8	12.0
March	38.6	24.4	3.1	11.1
April	39.9	26.4	3.2	10.3
May	40.5	27.1	2.9	10.5
June	48.4	30.7	4.0	13.7
July	53.8	33.1	5.5	15.2
August	58.7	36.3	5.4	17.0

1/ Includes all races other than Negro.

2/ Includes registrants found acceptable for limited service but not inducted; these were rejected for administrative reasons. A small proportion of other administrative reasons also appears in this group, but they amounted to less than 1 percent of the total rejections.

3/ Includes those failing to meet minimum intelligence standards as well as morons, imbeciles, idiots, and mental deficiency not specified as to type or degree.

Negro Rates. Negro rejection rates during the period January 1944-August 1945 did not follow any simple graphical curve. Rejections for Negroes were characterised by an extremely high peak in November 1944 at which time the rate reached 74.9 percent of the men examined. Lower peaks occurred in January 1944, March 1944, and March 1945, but these were insignificant in comparison to the major rise during the fall of 1944. Rates for mental disease and for physical defects caused the rising trend observed from May through November 1944, but mental deficiency contributed the most to the total rejection rate in all months after May 1944. Physical defects were the most important of the three groups prior to that time.

Negro rejections for mental deficiency reached a high point of 37.4 per 100 registrants examined in July 1944, but showed a gradual decrease from that time until August 1945 when they were responsible for 27.1 rejections per 100 examinations. Negro rates for physical defects were at their highest point during January 1944 and were lowest in February 1945 (15.6 per 100 registrants examined). The 1944 rates for physical defects decreased to a low point in June and July 1944 and then increased through November 1944. They next decreased through February and then started a very gradual increase until the end of the period of this study. Rejections for mental disease fluctuated very little except for the tremendous increase recorded from June 1944 through November 1944 and a similar rapid decrease from November 1944 through February 1945. The highest rate for mental disease occurred in November 1944 (18.8 per 100 examined); the average for the remainder of the period was approximately 10 percent of those examined.

White and Negro Rates Compared. A comparison of the rejection rates for the two racial groups shows that while more than one-half of the Negroes examined in each month were disqualified for general military service, this was true of white registrants during only three months of the 20-month period. The rates of rejection for physical defects and those for mental disease were somewhat similar for the races; but the mental deficiency rates ranged from four to fifteen times higher among Negroes than among white registrants. The fluctuations from month to month in rejection rates for each race did not follow the same general trends, since they were affected by varying factors governing selection of the men for examination.

Table 4. Rejection Rates for Physical and Mental Defects Per 100 Negro Registrants Given Preinduction and Induction Examinations, by Month

January 1944-August 1945

Month and Year of Examination	Rejections per 100 Examined			
	Total	Physical Defects 1/	Mental Defects	
			Mental Deficiency 2/	Mental Disease
1944				
January	59.5	26.1	19.9	13.5
February	53.3	24.1	18.9	10.3
March	57.8	25.4	20.9	11.5
April	55.4	24.7	19.1	11.6
May	52.4	21.1	21.0	10.3
June	57.3	15.9	34.1	7.3
July	61.5	15.8	37.4	8.3
August	63.5	17.8	34.2	11.5
September	66.9	18.9	34.3	13.7
October	70.5	19.7	35.8	15.5
November	74.9	26.0	30.1	18.8
December	66.8	21.4	29.8	15.6
1945				
January	61.3	16.6	33.1	11.6
February	54.9	15.0	31.2	8.7
March	61.8	16.9	34.0	10.9
April	61.4	18.4	33.3	9.7
May	57.8	18.0	31.7	8.1
June	56.7	17.1	30.9	8.7
July	57.1	18.3	28.6	10.2
August	57.8	20.2	27.1	10.5

1/ Includes registrants found acceptable for limited service but not inducted; these were rejected for administrative reasons. A small proportion of rejections for other administrative reasons also appears in this group, but they amounted to less than 1 percent of all rejections.

2/ Includes those failing to meet minimum intelligence standards as well as morons, imbeciles, idiots, and mental deficiency not specified as to type or degree.

Preinduction and Induction Rejection Rates

The rates of rejection among registrants who were given preinduction examination and those who reported for induction are shown, by month and race in Tables 1 and 2, Appendix C. The summary below presents the results of each type of examination from February 1944, the first month in which the preinduction procedure was followed fully, through August 1945.

Table 5. Results of Preinduction and Induction Examination
February 1944-August 1945

Race	Registrants Reporting For					
	Preinduction Examination			Induction		
	Number Examined	Number Rejected 1/	Rate 1/	Number Examined	Number Rejected	Rate 1/
All Races	5,469,200	2,177,000	39.8	2,340,900	163,000	7.0
White 2/	4,844,100	1,850,300	38.2	2,096,200	125,700	6.0
Negro	625,100	326,700	52.3	244,700	37,300	15.2

1/ Rate per 100 examined. Preinduction rates include registrants acceptable for limited service.

2/ Includes all races other than Negro.

As Table 5 shows, nearly 5,500,000 preinduction examinations were given during the 19 months. Nearly 2,200,000 of these resulted in rejection for general or "less than general" military service--a rate of approximately 40 rejections in each 100 examinations. 1/ Corresponding figures for white registrants were 4,850,000 examinations with 1,850,000 rejections (38.2 percent); for Negro registrants, 625,000 examinations and 327,000 rejections (52.3 percent).

1/ An unknown percentage of registrants who were given second preinduction examinations under the provisions of Local Board Memorandum No. 195, December 8, 1944 are included in these figures.

Of the 2,341,000 registrants who reported for induction during February 1944 through August 1945, a total of 163,000, or 7.0 percent, were rejected. The white rejection rate, 6.2 of each 100 registrants examined, was less than one-half that of the Negro registrants (15.2).

The preinduction figures shown in Table 5 represent a summary of Selective Service experience in procuring men for the armed forces, rather than an accurate index of the acceptability of individual registrants. This is true because the data include reexaminations of some registrants for whom both first and second examinations occurred within the nineteen months' period. The rates of rejection among registrants given preinduction examination who had not been previously examined, shown in Table 6, provide a truer index of the individual's acceptability under the physical and mental standards and the administrative policies which prevailed during the final year of hostilities. 1/

Table 6. Preinduction Rejection Rates and Percent Distribution of Examined Registrants, by Race and Examination Status

August 1944-August 1945

Race	Rejection Rate per 100			Percent of Total Examined		
	Total	Not Previously Examined	Previously Examined	Total	Not Previously Examined	Previously Examined
All races	40.6	37.6	56.8	100.0	84.2	15.8
White 1/	39.3	36.1	56.0	100.0	84.1	15.9
Negro	53.4	51.3	64.8	100.0	85.0	15.0

1/ Includes all races other than Negro.

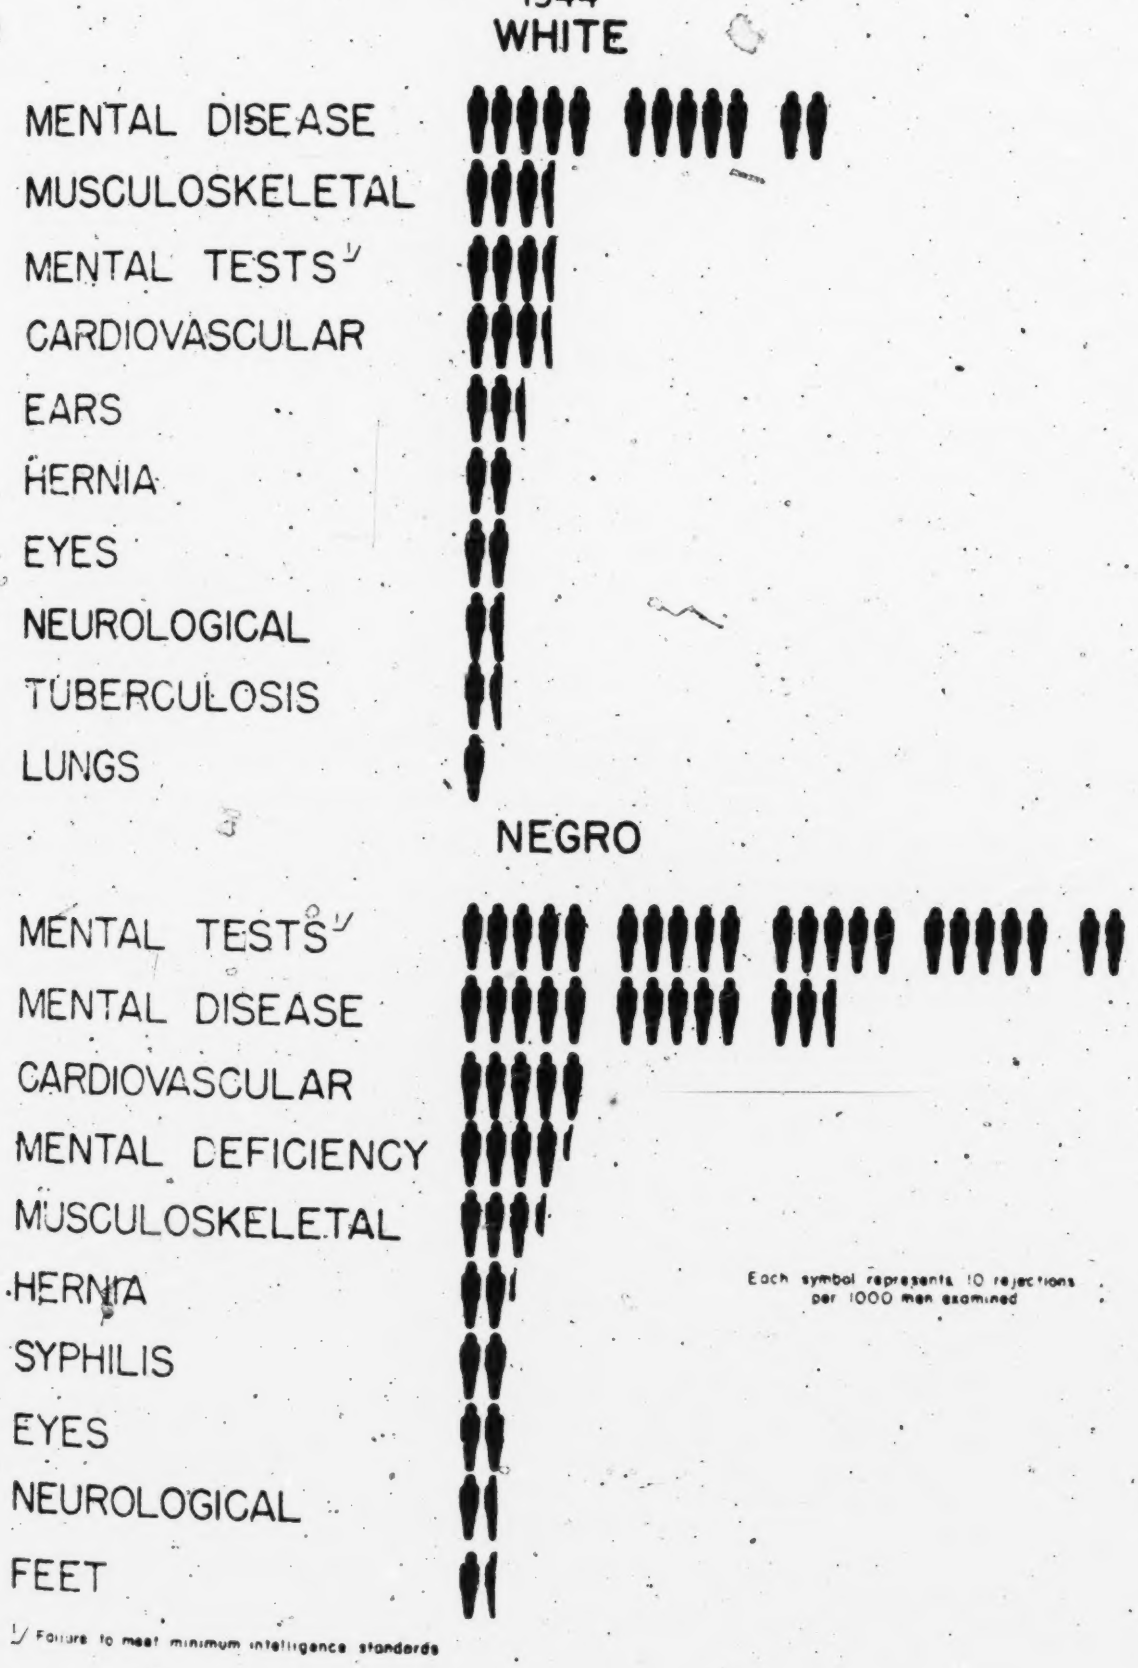
The rejection rate for registrants appearing for first examination (i.e., 18 year old registrants and those who had been deferred in industry or in agriculture without having been physically examined) was 37.6. Among reexamined registrants it was 56.8 percent. Nevertheless, the high rate of rejection in the latter group added only three percentage points to the total rate (40.6) since the reexamined men were a relatively small group - 15.8 percent of those examined.

Among white registrants examined for the first time the rate was 36.1 and among Negroes, [illegible] per 100 examined. The reexamination rates were 56.0 and 64.8 respectively, but in each race the percentage reexamined was low, so that the total rates were only slightly higher than those for registrants not previously examined.

Rejection Rates for Major Defect Groups

Rejection rates for each of the thirty broad groups of defects which were principal causes for rejection by the armed forces during 1944 and 1945 are shown in Table 7. The defect rates for 1944 are estimated by applying sample data on the percentages of rejection for these defects to the total rejection rates for the period. The defects of men found acceptable for limited service only are included in the rejection rates for the specific defect groups. The data for 1945 are based on a total count of rejections made by the War Department. The limited service defects are not distributed in this portion of the table, since these registrants were counted as administrative rejections and are included in the "Non-medical" category. The ten leading causes for rejection during 1944 are shown, by race, in Figure 2, and discussed in a later chapter on principal causes for rejection.

This difference in the method of counting limited service rejections affects any comparison of the rejection rates for defect groups which contain defects acceptable for limited service — notably certain defects of the eyes, ears, feet, and musculoskeletal system. Normally, these rates should be lower in the 1945 data than for 1944. Actually, they were the same or higher for these groups, indicating that many of the registrants with limited service defects who were selected and sent for reexamination during June-August 1945 were rejected outright instead of again being designated as acceptable for limited service. Thus, 19.6 per 1,000 registrants examined by the armed forces in 1944 were either rejected outright because of ear defects or were designated as acceptable for limited service, whereas in 1945, 23.9 per 1,000 were rejected outright because of these defects.



Although differences in rates for other possible limited service defects appear slight, unless the fact that limited service defects are not included in the 1945 data is considered, they indicate the reexamination and rejection of registrants with defects of the teeth, lungs, musculoskeletal system, feet, and skin, and those with endocrine disorders, neoplasms, weight deviation and those in the miscellaneous group of medical defects. For other groups, the slightly lower rates in 1945 may have been due to possible salvage of some men formerly rejected for tuberculosis, cardiovascular defects, hernia, and neurological disorders. The two defect groups which are also invariably cause for disqualification for any type of service - i.e., mental deficiency and mental disease - had almost the same rates of rejection during each year, the rate for mental deficiency being 11 and those for mental disease 120 per 1,000 examined.

1/ Complete data by examination status (i.e., whether or not the registrants had been previously examined) are not available for February-July 1944.

* Less than 0.05 per thousand.

1/ Data for 1944 estimated by applying sample distribution of causes for rejection to total rejection rates; 1945 data based on reports from the armed forces.

2/ Includes defects of registrants acceptable for limited service.

3/ Rates for specific defects do not include those of registrants acceptable for limited service. These registrants are included in the "nonmedical" category.

4/ Includes all races other than Negro.

5/ Includes morons, imbeciles, idiots and mental deficiency not specified as to type or degree.

6/ Failure to meet minimum intelligence standards.

During the year 1944, 4.1 percent of all rejected registrants were certified by local boards as unfit for any type of military service. The remaining 95.9 percent were rejected by armed forces' examiners at induction stations. Table 8 shows the percentage of rejections for each defect at local boards, induction stations (including both preinduction and induction examinations) and the two combined. The ten defect groups which accounted for 80 percent of all rejections during 1944 are summarized and briefly discussed below. The influence of local board rejections is apparent in the differences in the order of their importance as compared to the defects listed in Figure 2 as leading causes for rejection by the armed forces.

All Races	White	Negro
Mental disease	Mental disease	Minimum intelligence tests
Minimum intelligence tests	Musculoskeletal	Mental disease
Musculoskeletal	Cardiovascular	Cardiovascular
Cardiovascular	Minimum intelligence tests	Mental deficiency
Hernia	Ears	Musculoskeletal
Ears	Hernia	Hernia
Neurological	Neurological	Syphilis
Eyes	Eyes	Eyes
Tuberculosis	Tuberculosis	Neurological
Mental deficiency	Lungs and pleura	Feet

Mental disease. This group of defects was the leading cause for rejection among all races and among the white registrants, but it was second in importance among Negroes. Mental disease accounted for more than one-fourth (26.8 percent) of all the rejections during 1944; for 28.5 percent of white and 19.5 percent of Negro rejections. Detailed data covering a portion of the year indicate that the principal diagnoses were, in order: psychoneurosis, emotional instability, and asocial and amoral trends. 1/

Minimum intelligence tests. This category consists of registrants who failed to pass the series of psychological tests given by the armed forces. A Qualification Test was given to all registrants who were not high-school graduates. Those whose score on this test was low or who failed completely were given additional tests of a type determined by their ability or inability to speak, read, or write English. Registrants who failed these tests were considered incapable of absorbing military training and were rejected as failing to meet minimum intelligence standards, even though they might be physically qualified for general military service.

Failure to pass the minimum intelligence tests was cause for 12.8 percent of all the 1944 rejections, placing this defect second in order of relative importance. Among white registrants it was in fourth place, accounting for 8.0 percent of white rejections. It was the leading cause for Negro rejections, with 33.5 percent having the notation "Failure to meet minimum intelligence standards" as the principal reason for rejection.

Musculoskeletal defects. Defects of the bones, muscles, and joints were third among causes for rejection. They were recorded as the principal cause for 8.8 percent of all rejections; they were second in relative importance among white registrants, accounting for 9.6 percent of the rejections, and fifth in order among Negroes, causing only 5.4 percent of Negro rejections. The lower percentage of these rejections among Negroes as compared to whites, however, may arise from the tendency to record failure to pass the mental tests the most important cause for rejection in the Negro race, even though some of the registrants rejected for mental deficiency also had disqualifying musculoskeletal defects.

Cardiovascular defects. Defects of the heart and blood vessels were in fourth place, as the principal cause of 8.0 percent of all rejections during 1944. They were third in relative importance as cause for both white and Negro rejections. Hypertension was the most frequent diagnosis, with valvular heart disease not specified as to origin next in order of importance. Heart disease specified as rheumatic accounted for less than 10 percent of the rejections in this defect group.

Hernia. This defect, fifth in order of importance among all races and sixth for white and for Negro registrants, was the basis for 4.9 percent of all rejections, 5.2 percent of those for white registrants and 3.5 percent for Negroes. Inguinal hernias were responsible for approximately 85 percent of the hernia rejections with abdominal hernias and those unspecified as to type accounting for 15 percent of the rejections in this group of defects.

Ear defects. Registrants rejected principally because of ear defects formed 4.4 percent of all rejected registrants during 1944. This defect group, sixth in relative importance as cause for rejection, accounted for 5.2 percent of white and for only 0.6 percent of the Negro rejections. They did not appear

* Less than 0.05 percent.
1/ Based on a 20-percent sample of DSS Forms 221, Reports of Physical Examination and Induction for registrants inducted or rejected during 1944.
2/ Includes rejections on preinduction and induction examinations.
3/ Includes all races other than Negro.
4/ Includes morons, imbeciles, idiots, and mental deficiency not specified as to type or degree.
5/ Registrants rejected for failure to meet the minimum intelligence standards.

among the ten leading causes for rejection of Negroes. Indications are that otitis media and defects of the ear drums were by far the most frequent causes for rejection. Unilateral deafness was more frequently mentioned as principal cause for rejection than was defective hearing.

Neurological Disorders.. This defect group, which consists chiefly of residuals of poliomyelitis, was responsible for 4.1 percent of all rejections; for 4.4 percent of those among white and 2.7 percent among Negro registrants during 1944. Epilepsy was also an important diagnosis; it was more important as cause for white than for Negro rejections.

Eye Defects. Four percent of all rejections during the year resulted from eye defects, which were the principal cause for 4.3 percent of the white and 2.8 percent of the Negro rejection. They were eighth in order of importance as cause for white and ninth for Negro rejections. Detailed data indicate that defective vision was most frequently noted; it accounted for more than one-half of the white rejections for eye defects, but only a little more than one-quarter of the Negro rejections in this defect group were made because of defective vision. On the other hand, eye diseases and blindness, both unilateral and bilateral, were much more important as cause for Negro than for white rejections.

Tuberculosis. Tuberculosis caused 3.4 percent of the rejections during 1944. It was almost twice as important among white as among Negro registrants who were rejected, accounting for 3.7 percent of the white and 1.9 percent of the rejections of Negroes, among whom it was in eleventh place as cause for rejection. Active pulmonary tuberculosis was the most frequent diagnosis for each race, while the arrested type was next in relative importance.

Mental deficiency. Although tenth in importance as cause for rejection among all races, mental deficiency did not appear among the ten leading causes for rejection of white registrants. It was fourth in relative importance among Negro rejections, however. This category consisted largely of registrants described as morons, imbeciles, or idiots, those whose mental age or intelligence quotient was very low, and cases diagnosed simply as mental deficiency, with the type or degree not specified.

Syphylis. Seventh in order as cause for Negro rejections during 1944, syphilis caused only 1.0 percent of all rejections, and 0.6 percent of those for white registrants.

Lungs and pleura. Defects of the lungs and pleura were in tenth place as cause for rejection of white registrants but did not appear among the first ten causes for Negro rejections. These defects were the principal cause for 2.4 percent of the rejections among white registrants and for only 1.3 percent of those among Negroes. Asthma was the most frequent diagnosis recorded in this defect group.

Causes for Rejection at Local Boards During 1944.

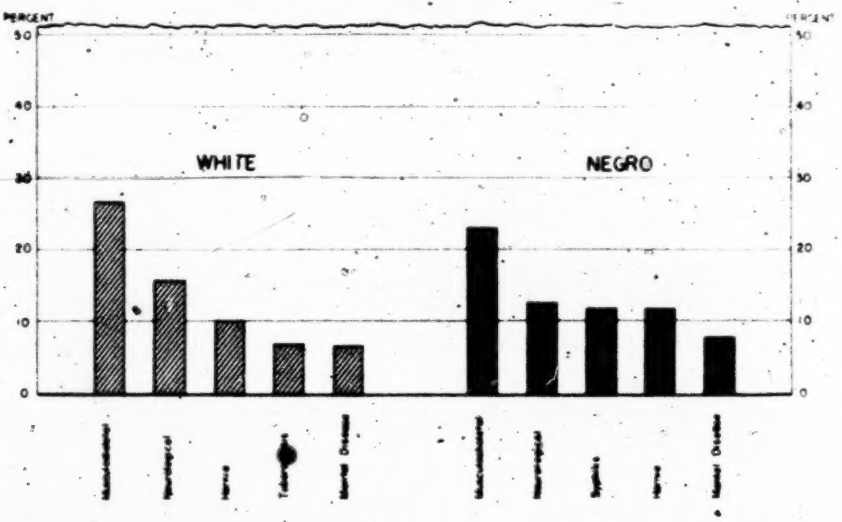
The preinduction plan of physical examination adopted in 1944 brought a radical change in the function of local board examination. Beginning in February, no registrant appeared before a local board physician unless he requested an examination because he knew or believed he had a manifestly disqualifying defect. Any local board could, however, certify as rejected any registrant for whom there was substantiated evidence of a defect which manifestly disqualified him for military service.

As a result of this change in local board procedures, the number of local board rejections materially decreased, and the defects for which registrants were rejected at the local board level were of a more serious and handicapping nature than when each registrant considered for induction had been examined by a local board physician. 1/

The effect of the preinduction plan on the local board examinations is shown by the fact that during February through December 1944, only 4.1 percent of all rejections occurred at local boards. This is in contrast to rejection by local board physicians of nearly one-half of all registrants considered for induction during the peacetime Selective Service period in 1940-1941; and to rejection of about ten percent of those considered during 1942 and 1943.

The percentage of rejected white registrants whose rejections occurred at local boards was more than twice as high as that of Negro registrants—4.5 percent as compared to only 2.1 percent. The smaller percentage of Negro rejections may be explained by either unawareness on the part of many that they could request local board examination or to lack of realization of the severity of their defects.

Four of the five defects which led as causes for white rejection were the same as those for Negroes. Tuberculosis appeared among the five most important causes for white rejection but was not in this listing for Negroes, while syphilis was relatively important among the Negro registrants and negligible among white registrants. These defects are discussed in the following paragraphs, in the order of their importance.



Musculoskeletal defects remained the most important cause for local board rejection (26.1 percent), as they had been during most of the period since the induction of registrants with syphilis began

1/ From January 1942 to January 1944, local board physicians used the List of Defects, DSS Form 220, as a guide in examination of all registrants. During January 1944, serological tests only were made by these physicians under the provisions of Local Board Memorandum No. 178, January 6, 1944.

early in the preceding year. During 1944, however, the percentage of musculoskeletal defects as causes for local board rejections sharply increased. More than one-fourth of the rejections were due to amputations, the most frequently recorded of these being, in order, amputations of the leg, of the fingers, and of the upper arm. Other musculoskeletal defects for which approximately one-fourth of the registrants in this group were rejected at local boards were shortening of one leg or arm, spinal malformation, and congenital deformity, particularly clubfoot.

FIGURE 3

FIVE LEADING CAUSES FOR REJECTION AT LOCAL BOARDS
1944

The bar diagram in Figure 3, based on data in Table 8, shows, by race, the five leading causes for rejection at local boards during 1944.

Neurological defects, which accounted for 15.1 percent of local board rejections, were second in importance among both white and Negro registrants, but they were the basis of 15.5 percent of white as compared to 12.3 percent of Negro rejections. Most of the rejections in this group were made because of deformity or atrophy resulting from infantile paralysis. Epilepsy was also an important cause for neurological rejection at local boards.

Hernia, third among leading causes, accounted for 10.2 percent of the rejections at the local board level. The percentage of white rejections for hernia (10.0 percent) was less than that of Negroes (11.1 percent). For each racial group, approximately 90 percent of the hernia rejections at local boards were inguinal hernias.

Tuberculosis, fourth in relative importance, was the basis of 6.7 percent of the local board rejections in 1944. This figure represents only the most advanced stages of the disease—registrants in hospitals or sanatoriums or those with affidavits from physicians stating that they were under medical care for tuberculosis or had been so during the preceding five years. Here, for the first time in Selective Service experience, the percentage of rejections for tuberculosis was higher among Negro (7.2 percent) than among white registrants (6.7 percent). The difference is slight; nevertheless, previous Selective Service data, which were weighted more heavily with examinations of men 20 years of age and over, had shown both a much smaller percentage of Negro than white rejections for tuberculosis and a lower prevalence of this disease among all the Negroes who appeared for physical examination. The 1944 data include a large proportion of teen age registrants, for whom the death rate is more than nine times as high among Negroes as among whites. This lower prevalence among the older Negroes, coupled with the higher percentage of far-advanced tuberculosis among Negroes rejected at local boards during 1944, tends to substantiate previous observations to the effect that the lower prevalence among living Negroes than among living whites 20-44 years of age who were given Selective Service physical examinations is attributable to the more rapid course of tuberculosis in the Negro race. 1/

1/ A discussion of these differences in the prevalence of tuberculosis, with footnote references to other literature on the subject, may be found pages 10 [illegible] 11, Medical Statistics Bulletin No. 2, issued by National Headquarters, Selective Service System, August 1, 1943.

Mental disease was the principal cause for 6.6 percent of local board rejections in 1944; for 6.5 percent of the white rejections and 7.7 percent of those for Negroes. Since registrants themselves were not likely to apply for local board examination because of mental or personality disorders, these percentages should represent registrants in mental institutions, those with history of commitment to such institutions, and those under past or present observation or treatment for mental or personality disorders.

Syphilis, which ranked third among principal causes for Negro rejections (11.6 percent) at the local board level during 1944, was unimportant in relation to white rejections (0.6 percent). The only forms of syphilis for which the local boards could reject the registrants who requested examination or offered proof of disqualification were cardiovascular, cerebrospinal, or visceral syphilis.

Principal Cause for Induction Station Rejection During 1944.

The induction station data shown in Table 8 represent the armed forces' rejections of registrants sent for preinduction examination and also those who reported for induction. Together they comprised nearly 96 percent of all rejections made during 1944. The leading causes for rejection were, in order of importance: mental disease, failure to meet minimum intelligence standards, cardiovascular defects, musculoskeletal defects, and hernia. Each of the other defect groups accounted for less than five percent of the rejections at induction stations.

The leading causes for rejection among white registrants rejected at preinduction and induction were the same except that rejections for ear defects, fifth in order among white registrants, were replaced by rejections for hernia in the Negro race. Rejection rates for these causes are shown in the pictorial bar chart, Figure 2.

Among white registrants, mental disease, the most frequently noted cause, accounted for 29.6 percent of the rejections. Second in order were musculoskeletal defects, with 8.8 percent of the rejections. Failure to meet the minimum intelligence standards was third in order of importance, accounting for 8.4 percent of the rejections. Cardiovascular defects were responsible for 8.3 percent of the rejections and ear defects for 5.4 percent. No other single defect group was responsible for as much as five percent of rejections except hernia, which was in sixth place among the causes for rejection.

The actual importance of disqualifying physical defects among Negroes rejected by the armed forces was obscured to some extent by the fact that more than one-third were rejected primarily because they failed the psychological tests. It is likely that a large proportion of these registrants also had physical defects for which they would have been rejected if they had passed the tests.

The leading cause for rejection of Negroes at induction stations was failure to meet the intelligence standards, which formed 34.3 percent of their rejections. Mental disease, the second defect group in order of importance, accounted for 19.8 percent of Negro rejections; it was followed, in order, by cardiovascular defects, 7.5 percent, mental deficiency, 6.6 percent, and musculoskeletal defects, 5.0 percent.

Principal Causes For Rejection In Relation To Age

Mental defects caused a larger percentage of rejections of the younger registrants, while physical defects were more important among men 26 years of age and older. (Tables 1, 2, and 3, Appendix B-summarized in Table 9.) This rejection of younger registrants for mental defects was due principally to diagnoses of emotional immaturity and psychoneurosis. Failure to pass the psychological tests was also frequently a cause for rejection among the younger men than among those 26 and over.

White registrants in any age group were less apt to be rejected for mental than for physical defects, but nearly two-thirds of the Negroes in the 18 and the 19-25 year age groups were rejected for mental defects, and in the two older groups, (26-29 and 30-37 years) more than one-half of the rejections were for mental defects.

Three of the defect groups which were among the leading causes for all rejections during the year were increasingly important among rejections in each advancing age group. These were tuberculosis, principal cause for 2.9 percent of the rejections of 18 year old registrants and 3.9 percent of those 30 years of age and over; cardiovascular defects, for which the corresponding percentages were 7.0 and 9.1 percent; and musculoskeletal defects, which accounted for 7.5 percent of the rejections in the youngest age group and 10.5 percent in the oldest.

Other defect groups which increased in importance as cause for rejection with advancing age, although relatively few men were rejected for these reasons, were nasal and dental defects, varicose veins, defects of the abdominal viscera, hemorrhoids, and syphilis.

Decreases in the percentage of rejections among older men occurred for several defect groups. Mental disease was the basis of 27.3 percent of the rejections among 18 year old registrants and 25.8 percent among those 30-37. Feet defects, weight deviation, kidney and urinary defects, and those of the skin and the genitalia were all of less relative importance as cause for rejection in each advancing age group. Failure to pass the psychological tests also followed this general trend. Smaller percentages of rejections for infections and parasitic diseases and acute conditions were noted among older men than among those under 26 years of age.

Table 9

Percentage of Registrants Rejected for Mental, Physical, and Nonmedical Reasons, by Race and Age Group
February 1944-December 1944

Principal Cause for Rejection	All Ages	Percent of Total Rejections — Age Group			
		18	19-25	26-29	30-37
		All Races			
Total	100.0	100.0	100.0	100.0	100.0
Mental	42.3	44.9	47.1	39.6	38.3
Physical	56.1	53.8	51.2	58.8	60.2
Nonmedical	1.6	1.3	1.7	1.6	1.5
		White 1/			
Total	100.0	100.0	100.0	100.0	100.0
Mental	38.3	43.1	42.0	35.7	35.3
Physical	60.2	55.7	56.4	62.8	63.3
Nonmedical	1.5	1.2	1.6	1.5	1.4
		Negro			
Total	100.0	100.0	100.0	100.0	100.0
Mental	60.8	65.0	62.8	58.0	55.4
Physical	37.2	33.1	33.6	39.8	42.3
Nonmedical	2.0	1.9	1.8	2.2	2.3

1/ Includes all races other than Negro.

Among white registrants, six defects were increasingly important as principal cause for rejection in each older age group. These were tuberculosis, cardiovascular defects, varicose veins, hemorrhoids, syphilis, and musculoskeletal defects. Defects which were of less relative importance with advancing age were those of the eyes, ears, kidney and urinary system, and feet. Rejections for mental deficiency also decreased in importance, as did failure to pass the intelligence tests.

Negro registrants showed definite upward trends with respect to defects in relation to age in the following groups: lungs, cardiovascular defects, varicose veins, hemorrhoids, syphilis, and defects of the abdominal viscera. Decreases in relative importance among the older men occurred for kidney and urinary defects, infectious and parasitic diseases, and acute conditions.

It is of interest that for both the white and the Negro races failure to pass the psychological tests caused relatively more rejections among younger than among older men. This suggests the possibility that the tests may require a breadth of experience and ability to reason which is more apt to be found in older registrants.

Occupations of Rejected Registrants.

The relative frequency with which certain defects were mentioned as principal cause for rejection of men in the various occupational groups is presented in Table 10. In evaluating this table, it should be borne in mind that because of deferment policies, particularly those in agriculture, the data may not be representative of the groups in the total population. Furthermore, the differing race compositions of each occupation must be borne in mind in the comparison of different occupations.

Table 10

Percentage of Rejections for Selected Defects, by Occupation

February 1944-April 1944

Occupation	Total	Percentage in Each Occupational Group Rejected for: Mental Disease	Musculo-skeletal & Feet 1/	Cardio-vascular	Hernia	Eyes	Tuber-culosis	Neuro-logical	Mental Defici-ency 2/	Other
All occupations	100.0	26.0	12.9	9.2	5.5	4.5	3.7	3.6	12.4	22.2
Professional and semiprofessional	100.0	23.8	15.4	12.1	4.6	8.1	4.5	4.0	0.3	27.2

Clerical and sales	100.0	23.3	15.1	11.5	6.5	5.5	4.9	3.9	1.1	28.2
Craftsmen	100.0	26.7	15.4	9.9	5.7	4.5	4.1	4.2	3.2	26.3
Operatives	100.0	27.3	13.2	9.5	5.8	4.1	3.7	3.7	8.5	24.2
Domestic and protective service	100.0	19.0	13.5	14.4	6.0	4.5	5.0	1.0	3.2	33.4
Other service workers	100.0	23.4	12.8	9.4	7.4	3.9	4.7	1.9	12.3	24.2
Farm laborers	100.0	25.9	8.9	6.4	4.5	3.3	2.1	2.8	34.1	12.0
Laborers (except farm)	100.0	23.6	10.9	7.9	4.9	4.1	2.3	3.0	28.1	15.2
Students	100.0	18.6	13.6	15.1	5.0	9.6	3.6	3.2	0.6	30.7
Emergency and unemployed	100.0	33.2	12.9	4.7	3.8	3.9	5.3	4.7	15.2	16.3
Non-classifiable	100.0	27.6	12.3	7.2	6.7	4.3	4.2	3.6	15.0	19.1

1/ Includes rejections for poliomyelitis and its residuals.
2/ Includes rejections for failure to meet minimum intelligence standards.

Mental disease was the largest single cause for rejection in all the occupations except the two groups of laborers (farm and other). In these two groups mental deficiency and failure to meet the minimum intelligence standards caused the highest percentage of the rejections. Negroes are, of course, particularly concentrated in these groups.

Craftsmen and the professional and semiprofessional groups had a larger percentage of rejections for musculoskeletal and feet defects than did any other major occupations. Students had the highest percentage of rejections for cardiovascular defects; that for hernia was highest among service workers other than domestic and protective (barbers, beauticians, hospital attendants, etc.). The highest percentage of eye defects noted as cause for rejection was among students; tuberculosis and neurological disorders each accounted for relatively more rejections of emergency workers and the unemployed than of any other group. Of the gainfully employed registrants, however, the highest percentage of tuberculosis rejections was found among domestic and protective service workers.

1411

THE PREVALENCE OF DEFECTS

In addition to the principal defects which have been presented in the preceding tables, data on a maximum of two other defects per registrant examined were obtained for the year 1944. This represents an underestimate of the total number of defects actually found upon physical examination; however, the data compare favorably with similar data recorded during the first two years of the war. 1/ Table 11 presents the prevalence of the specific defect groups among men inducted or rejected during the eleven-month period.

A total of 1,205 defects was recorded for each 1,000 registrants physically examined--an average of 1.2 defects per man. The corresponding figure for white registrants was 1,194.2 and for Negro registrants, 1,274.0.

The ten defects most frequently recorded were, in order of their importance:

White	Negro
Eyes	Minimum intelligence tests
Mental disease	Syphilis
Musculoskeletal	Mental disease
Feet	Feet
Cardiovascular	Eyes
Teeth	Cardiovascular
Genitalia	Musculoskeletal
Nose and sinus	Mental deficiency
Ears	Hernia
Underweight and overweight	Genitalia

The prevalence rate for each defect varied by Selective Service classification. For example, defects were recorded for 975.2 in every 1,000 white registrants inducted for general service, a rate of less than one defect per man. They were noted for 1,716.3 per 1,000 inducted for limited service, and for 1,442.2 rejected. Corresponding figures for Negro registrants were 901.4 per 1,000 inducted for general service, 1,732.4 inducted for limited service, and 1,478.8 for those rejected.

Eye defects. These were the most frequently recorded defects of all races and of white registrants, and they were recorded almost twice as often for white as for Negro registrants (177.2 and 89.2 per 1,000 respectively). As might be expected, a much higher prevalence of eye defects was noted among each 1,000 men who were inducted for limited service than among those inducted for general service, or among the rejected registrants.

Mental disease. This defect group was noted with almost the same frequency among white and Negro registrants. However, it was found less frequently among both inducted and rejected Negroes than among whites in these categories. Nine white registrants in each 1,000 inducted for general service and 7 per 1,000 inducted for limited service had some form of mild mental or personality disorder; but more serious forms of these disorders were found in 304 per 1,000 of the rejected white men and 221 per 1,000 rejected Negroes.

Musculoskeletal. Defects of the bones, muscles, and joints were recorded more frequently for white registrants than for Negroes, except among those inducted for limited service. In this category, 145 per 1,000 white and 162 per 1,000 Negroes had musculoskeletal defects noted on their physical examination reports.

Feet defects. These defects were fourth in relative frequency among both white and Negro registrants. They consisted mainly of descriptions of flat feet (pes planus) and were found more often in Negro than in white registrants, among inducted as well as rejected groups.

Cardiovascular. Defects of the heart and blood vessels were found more often in Negro than in white registrants; but among inducted men, they were less frequent in Negroes. Hypertension was the most frequently recorded cardiovascular defect of Negro registrants.

Teeth. The prevalence shown for teeth defects is an underestimate, as the 1944 coding of physical examination reports did not include routine coding of the dental chart from which data had been obtained on the reports used for a previous study of peacetime experience. 2/ Nevertheless, teeth defects were the fifth defect in order of frequency among white registrants. This was occasioned by recording of dental defects for inducted men, both general and limited service. They were not sufficiently serious from a military standpoint, however, to appear often in the summary of defects for rejected white or Negro registrants.

1/ Medical Statistics Bulletin No. 3, pp. 124-127. During the peacetime period of Selective Service, all the defects noted on the physical examination forms by local board physicians were counted, and the results are shown in Medical Statistics Bulletin No. 2, Table 7, pp. 24-37.

1/ Based on a 20-percent sample of Forms 221 for registrants inducted or rejected during February 1944 through December 1944.
2/ Includes all races other than Negro.
3/ Failure to meet minimum intelligence standards.

1416

Genitalia. The count for this group of defects was also obtained largely by coding minor defects of inducted men. They were noted more frequently among Negroes than among whites in both the inducted and the rejected groups; but the prevalence rate among all the examined Negroes (i.e., inducted and rejected) was lower than among the white registrants.

Nose and sinus. These defects were tabulated almost nine times as often for white as for Negro registrants. There was a tendency to induct men in both racial categories with moderate nasal defects and deformities, for either limited or general service.

Ears. Defects and deformities of the ear, ninth in order of frequency among white registrants, were noted more often among white than among Negro registrants. Relatively more Negroes than whites who had ear defects were inducted for limited service, possibly those with deformities or other disfigurations of the ear.

Underweight and overweight. Underweight and overweight also occurred more frequently among white than among Negro registrants in each of the classifications. They were less frequently tabulated for Negro registrants than were neurological disorders, gonorrhea, and tuberculosis, none of which were among the ten defects most often noted among Negroes.

Other defects. Other defects which were much more important among Negroes than among whites were failure to meet the minimum intelligence standards and mental deficiency, which together were recorded for 281.8 in each 1,000 Negroes examined and only 48.5 per 1,000 whites; and syphilis, recorded for 147.6 per 1,000 Negroes as compared to 9.5 per 1,000 whites examined. A relatively large proportion of inducted Negroes had syphilis -- 232 in every 1,000 who were inducted for general service and 165.5 per 1,000 inducted for limited service. 1/ Corresponding figures for white registrants were 7.9 and 5.3 per 1,000 respectively. Syphilis was mentioned on the reports of 11.2 per 1,000 white men who were rejected, as compared to 100.1 per 1,000 Negroes.

RESULTS OF PHYSICAL EXAMINATION IN INDIVIDUAL STATES

Physical examinations in the individual states necessarily differed in their results from those for the Nation as a whole. The figures presented in preceding sections are an average of the data from all the states, which varied widely among themselves with respect to the proportion of men sent for reexamination, the ages and racial composition of the examined groups, and in interpretation by armed forces' examiners of the physical standards and by local boards concerning the policies on deferment. Information on the percentage of men in each state who appeared for first examination by the armed forces and those who were reexamined during the final calendar year of hostilities; the general service rejection rates for each of these groups; and the percent distribution of principal causes for rejection in each state during 1944, is contained in Appendix D.

Preinduction Examination

Examination Status. Since the vast majority of rejections occurred when men were sent for preinduction physical examination and since reexaminations contributed to the high rejection rates, it is important to know what types of registrants were being forwarded in the various states. The first four tables in Appendix D divide the examined men into two groups. Those who had not been previously examined were chiefly the eighteen year old registrants. This group also included men 19 years of age and over who had been given occupational or other deferment and who had never undergone Selective Service physical examination. The previously examined men consisted of: (a) registrants who had been rejected on previous examination and who were reexamined as standards were changed or the conditions causing rejection were removed; and (b) registrants found acceptable on preinduction examination and later rejected when they reported for induction, or found acceptable for limited service only and again forwarded for reexamination as standards changed. Thus, some of the previously examined men may have been examined more than once during the period for which shown in the appendix tables under discussion. In the data for men examined for the first time, however, each registrant is represented only once.

On a national basis, an average of 84.2 percent of all registrants given preinduction physical examination appeared for the first time. Among the states, this proportion varied from 67.1 percent in New York to 97.5 in South Dakota. In 30 states, 84 percent or more of the men reporting had no previous examinations.

White registrants not previously examined comprised 84.1 percent of the men in their race who were given preinduction examination. Thirty-three states had percentages as high or higher than 84 percent. The states with the lowest and the highest percentages of white registrants appearing for first examinations were, respectively, New York and South Dakota.

1/ Registrants with syphilis might be given limited service classification until preliminary treatment was completed.

PREINDUCTION REJECTION RATES PER 100 REGISTRANTS EXAMINED
AUGUST 1944 — AUGUST 1945
ALL RACES

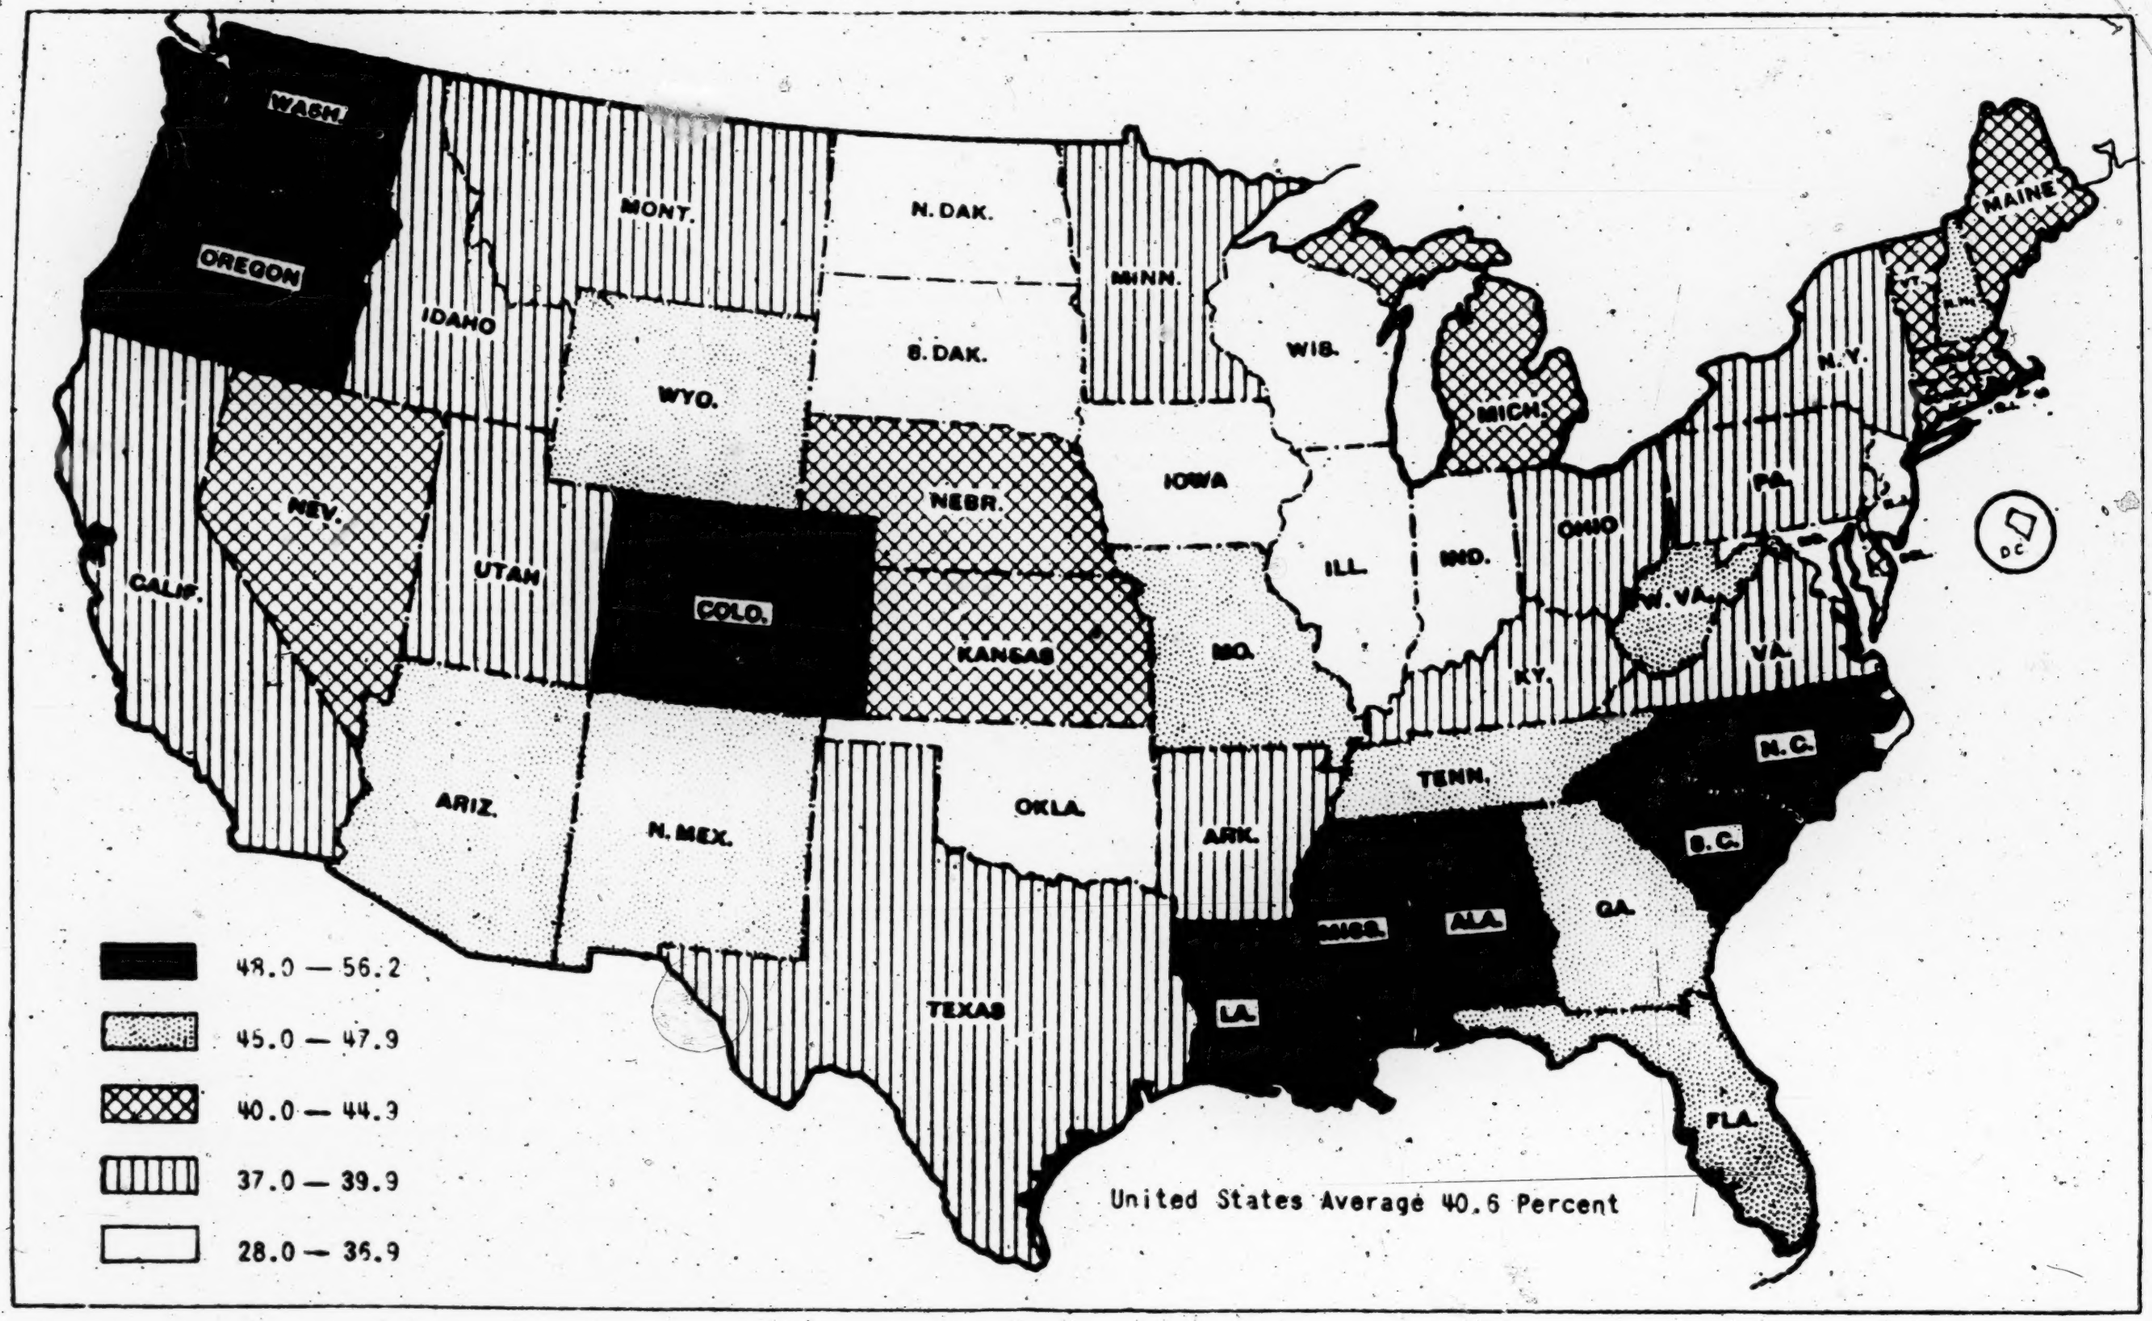

FIGURE 4

Eighty-five percent of all the Negroes given preinduction examination appeared for the first time and in none of the states for which the distribution was calculated were fewer than 74.5 percent of the registrants in the group not previously examined. This percentage was found in Florida, while Arkansas had the highest percentage (93.7) of Negroes given first examination.

Rejection rates. The preinduction rejection rates for each state are shown in Table 2, Appendix D, and in Figure 4. For the one-year period, the national rate was 40.6, with a range in the state rates from 28.5 rejections per 100 registrants examined in Wisconsin to 56.2 in Mississippi. The same states (Wisconsin and Mississippi) had the lowest and the highest rates for registrants not previously examined - 25.9 and 52.0, respectively, as compared to a national rate of 37.6. Among previously examined men, rejection rates were much higher-56.8 percent for the Continental United States, with a low rate of 39.9 in the District of Columbia and the highest, 80.8, in Mississippi (Table 12).

Table 12

Range of Rejection Rates, by State, Among Registrants Forwarded for Preinduction Examination August 1944-August 1945

Examination Status	All Races			White 1/			Negro		
	Cont. U.S.	Lowest State	Highest State	Cont. U.S.	Lowest State	Highest State	Cont. U.S.	Lowest State	Highest State
Total	40.6	28.5	56.2	39.3	28.4	51.7	53.4	29.9	71.2
Not previously examined	37.6	25.9	52.0	36.1	25.8	51.1	51.3	28.3	70.0
Previously examined	56.8	39.9	80.8	56.0	38.2	77.2	64.8	44.5	85.1

1/ Includes all races other than Negro.

White rejection rates on preinduction followed essentially the same pattern as that for all races, except that the highest rejection rate among registrants not previously examined (51.1) occurred in Oregon. Since it appears unlikely that 18 year old registrants should differ so widely in physical fitness in the various states, it may be assumed that among the group of white registrants given first examination some indication appears as to result of differences in application of deferment policies. In states which had been strict in regard to granting occupational deferments to men under 26 who were apparently physically fit for military service, rejection rates for men not previously examined were apt to be higher than in states which had more physically fit registrants to examine under the instructions for examination of all men under 26 with occupational deferments except those who had been placed in occupationally deferred classes after being rejected for physical reasons. 1/ Reexaminations of white registrants resulted in rejection of 56 per 100, with rates as high or higher in 33 states. The lowest rate was in the District of Columbia (38.2) and the highest in Mississippi (77.2).

The Negro rejection rate on preinduction examination during August 1944-August 1945 was 53.4 per 100 examined. In ten of the thirty states which examined at least 50 Negroes during the period, the rates were as high or higher than the national average. The lowest state rate for Negroes was 29.9 in Kentucky while the highest, 71.2, was reported in Georgia (Table 12).

Negro registrants not previously examined had a rejection rate of 51.3, with higher rates in ten states. In Kentucky, only 28.3 percent of the Negroes given first examination were rejected, in contrast to 70.0 percent in Georgia. Reexaminations of Negro registrants yielded a rejection rate of 64.8, with rates in the individual states ranging from 44.5 in the District of Columbia to 85.1 in Georgia.

Induction Examination

The term "induction examination" as used in this bulletin denotes the disposition of registrants who reported for induction, regardless of whether they were given complete physical examination or subjected to a physical inspection only. Table 3; in Appendix D, presents the rates separately for men not previously examined and those who reported either for physical inspection or for complete reexamination. The first group was composed of: (a) men who, when ordered to report for preinduction examination, signed requests to be immediately inducted if they were found physically acceptable for general military service; and (b) delinquents, or registrants who had failed to report for preinduction physical examination. The second group was made up of men who had been given preinduction physical examinations prior to the date of reporting for induction. Less than three percent of these had been rejected on preinduction examination. The remainder had been designated as acceptable for either general, "military", or limited service.

1/ Rejected registrants who were in essential occupations could be transferred from classes IV-F and I-A-L to classes indicating their occupational status, but their "F" and "L" designations were retained - as II-A(F), II-C(F), II-A(L), etc. See State Director Advice No. 288, January 3, 1945.

Table 13

Range of Rejection Rates, by State, Among Registrants
Reporting for Induction
August 1944-August 1945

Examination Status	All Races			White 1/			Negro		
	Cont. U. S.	Lowest State	Highest State	Cont. U. S.	Lowest State	Highest State	Cont. U. S.	Lowest State	Highest State
Total	9.5	3.9	15.8	8.4	3.9	14.9	19.2	10.6	34.5
Not previously examined	31.5	4.0	50.0	27.9	4.0	47.2	50.8	18.3	73.2
Previously examined	8.2	3.6	15.2	7.3	3.6	14.2	16.5	3.9	30.6

1/ Includes all races other than Negro.

During August 1944 through August 1945, 9.5 percent of all registrants reporting for induction were rejected. The range of rates within the states was from 3.9 in Minnesota to 15.8 in North Carolina. Twenty-six states had rates higher than the national average.

Registrants examined for the first time when they were reporting for induction were rejected at a rate of 31.5 per 100. This high rejection rate as compared to only 8.2 for previously examined registrants contributed little to the overall rate of 9.5, because the group forwarded for first examination was only five percent of all the registrants reporting for induction. In South Dakota, the rejection rate on first examination was only 4 per 100 examined; in Louisiana it was 50.

The fact that armed forces' examiners found a registrant qualified on preinduction examination did not constitute his final acceptance for military service. Of these previously examined registrants, 8.2 percent were rejected when they reported for induction. As explained in a preceding chapter these rejections might be due to changes in the physical standards during the interval between preinduction examination and time of returning for induction. They might also occur because of stricter interpretation of the standards as a result of changes in assignments of medical and psychiatric examiners to the induction stations; or registrants might have acquired temporary or permanent defects between preinduction and induction examinations. The state which had the lowest rejection rate for previously examined men was Wisconsin, with only 3.6 percent rejected, while North Carolina had the highest rate, 15.2 (Table 13).

The white rejection rates followed a pattern similar to those for all races, but Negro rates for the Continental United States were more than twice as high for all Negroes examined as were white rates—19.2 as compared to 8.4 for white registrants. Corresponding rates for not previously examined registrants were 50.8 and 27.9. For previously examined registrants, they were 16.5 and 7.3.

PREPARATION AND PROCESSING OF FORM 221

Information on the defects of registrants physically examined during 1944 was obtained from a 20 percent sample study of DSS Forms 221, Reports of Physical Examination and Induction. The reproduced form shown in Figure 5 is the revision of June 19, 1944, on which changes were made primarily to provide for recording the results of physical inspection on induction examinations and for certain changes in recording local board physical examinations. 1/ Figure 6 is a reproduction of the punch card to which information on the Form 221 was transferred in order to obtain data for analysis.

Preparation of the Report

At the time a registrant was ordered to report for preinduction examination, the local board clerk prepared a set of Forms 221 for recording the results of the physical examination. Section I of the form was completed by the local board clerk, using the latest information available from the registrant's file. The local board number and address were stamped in the box on page 1 at the upper right corner of the form.

Section II, on page 2, was used only when the registrant requested deferment because of a defect manifestly disqualifying for any form of military service. In this case, the registrant was either referred to a local board physician for examination or, if the registrant was unable to appear for physical examination, the local board referred to the physician for review the registrant's affidavit from a reputable physician or institution to the effect that he possessed one or more manifestly disqualifying defects. Any registrant who was disqualified by the local board physician therefore had only the first two sections of his physical examination report completed.

If the registrant did not request deferment by the local board, he reported to the armed forces induction station for a preinduction examination, which was recorded in Section IV, on pages 3 and 4, of the Form 221. The results of the mental tests, as well as the physical and psychiatric examinations, were entered in this section and the recommendation of the armed forces' examiners as to acceptability was recorded at the end of the examination. Then the registrant was returned to his home, unless he had requested immediate induction, and the complete set of Forms 221 was sent back to his local board, to be forwarded again when he reported for induction. If he appeared within the time limit set by the armed forces (90 days) Sections V and VI were completed to show the results of physical inspection by the induction station and the disposition of the registrant. If this time limit had been exceeded, however, a completely new set of Forms 221 had to be prepared. In such a case, the first set of forms was attached to the new one for reference on the part of the medical examiners. 2/ Section III, which contained miscellaneous information for the armed forces, was filled out only if the registrant was accepted for military service.

Sampling Procedure. During 1944 the actual work of sampling and coding Forms 221 was done by the Office of the Surgeon General, War Department, following a plan agreed upon jointly by the Selective Service System and the War and Navy Departments. Under this cooperative arrangement for obtaining medical defect data, random samples were drawn from each month's receipts of the physical examination reports. Schedules for registrants whose order numbers ended with certain digits were withdrawn, and the total schedules thus obtained were carefully checked against both actual and expected receipts of Form 221 to determine whether the sample was representative. The size of the sample was adjusted each month to a limit of 70,000 or 80,000 forms which could be processed, and the samples thus obtained varied from 10 to 30 percent of the inductions and rejections during the month. A 20-percent sample was drawn from the data to provide the information for the entire year.

The data for 1944 were limited by the fact that the original and copies of the physical examination reports of men who received preinduction examination but were not returned for induction because of changes in age groups acceptable or continuation of occupational deferments remained in their files. The samples selected for statistical study were thus based upon only inducted and rejected men, rather than all examined men.

Codes and Punch Cards. The data shown in the headings of the columns on the punch card (Figure 6) were coded from the Forms 221 and transferred to the card for tabulation. As the card shows, the data were of four types: identification according to the registrant's local board county, state, and order number; socio-economic data from page 1 of the form; the medical data, obtained from either Section II or Section IV; and the results of the preinduction or induction examination, from Section V.

Under the system of joint processing of Form 221 for the Selective Service System, the Army and the Navy, a medical code was formulated which would meet the needs of each of the agencies. This code consisted of 542 titles which contained key words likely to appear in the description of defects. The titles were listed alphabetically in manuals, with the code numbers which were to be assigned to each.

1/ During the first six months of 1944, the Form 221 revision of September 20, 1943 was used.
2/ Beginning in July 19..., registrants whose preinduction examination was more than 90 days old could be forwarded for induction without a second preinduction physical examination. (Local Board Memorandum 178, June 8, 19...)

Thus, if the medical examiner recorded "unilateral blindness" as the most important cause for rejection, the coder assigned "002" to designate this defect; however, if the cause for rejection was stated as "defective vision; less than minimum requirements," the code assigned was "004".

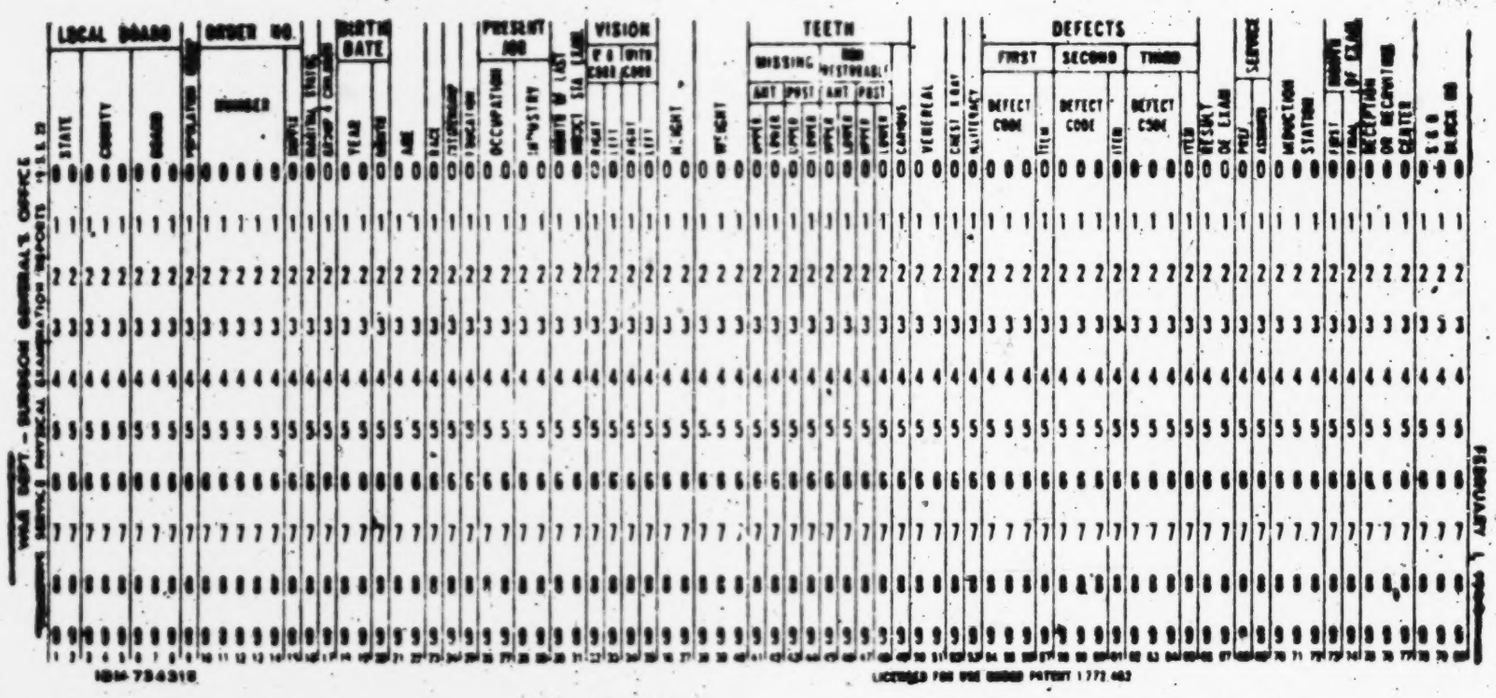

Figure 5. Punch Card Used for Porcessing Forms 221 During 1944.

The physical and mental defects selected for coding during 1944 were obtained primarily from the "Summary of Defects," shown in line 67 of the Form 221 , which is reproduced as Figure 5. Three defects were coded for each registrant, however, if they appeared on the form, either in the summary, in the preceding lines which described "Other Defects," or in the main body of the form. When more than three defects were recorded, the three most likely to be handicapping from the standpoint of military service were usually selected for coding.

The 542 titles of the defect code were classified into 27 major sections. To avoid the risk of overcounting causes for rejection, only one defect was coded within each of the 27 sections. This was accomplished by use of a "priority system" explained in the coding manual. 1/ Thus, if an examiner recorded "rheumatic heart disease with mitral regurgitation," only rheumatic heart disease was coded, although a code number had been provided for entries which described mitral regurgitation.

1/ See "Defect Code Used Jointly by the Selective Service System, War Manpower Commission, The Office of the Surgeon General, War Department, and the Bureau of Medicine and Surgery, Navy Department, for the list of codes used in Processing of Reports of Physical Examination and Induction, DSS Forms 221", November 1943.

County Court House
Thornton, Maryland 001

(Local Board of Origin Date Stamp with Code)

REPORT OF
PHYSICAL EXAMINATION AND INDUCTION

(See appropriate instructions before preparation and distribution)

Plate Imprint	Armed Forces Serial No.

SECTION I.—GENERAL (Local board will prepare from latest information available).

1. Name JONES (Last—in capitals) JESSE (First) MELVIN (Middle)
2. Present address RFD 1 (Street or rural route) Thornton (Town or city) Thornton (County) Maryland (State)
3. Registrant's order No. 356 4. Social Security No. 521-01-1221
5. Marital status: Single ☒ Married ☐ Widower ☐ Divorced ☐ Separated ☐
6. Number of Group 4 children 7. Birthdate of registrant June (Month) 10, (Day) 1926 (Year)
8. Birthplace of registrant Thornton (Town or city) Maryland (State) U S A (Country)
9. Race: White ☒ Negro ☐, Other (specify)
10. Citizenship: (a) United States citizen: Yes ☐ No ☐ (b) First papers: Yes ☐ No ☐ (c) If not citizen of United States, citizen or subject of (specify country)
11. Court record: (a) Convicted of a crime other than minor traffic violation: Yes ☐ No ☒
(b) If "yes," specify crime, date, location of court, and sentence
(c) Now in custody of the law? Yes ☐ No ☒
(d) If answer to (c) is "yes," is necessary release or waiver attached? Yes ☐ No ☐
12. United States military service: (a) Previous service: None ☒ Army ☐ National Guard ☐ Navy ☐ Marine Corps ☐ Coast Guard ☐.
(b) Date of discharge — (c) Type of discharge
13. Education: (Number of years completed) Elementary school 7 High school 2 Trade, night, or business school — College or university —
14. Occupation and industry: (a) Title and duties of present job Saw Mill Helper
(b) Length of experience: Years 1 Months —
(c) Business of present employer Saw Mill Owner
15. Employment class (present job): Employee ☒ Independent worker ☐ Employer ☐ Unpaid family worker ☐ Student ☐ Unemployed ☐
16. (a) Number of times previously sent to armed forces for examination or induction None
(b) Date last sent
17. (a) If transferred for preinduction physical examination, local board of transfer is Local Board No. — County or City of — State of —
(b) If transferred for induction, local board of transfer is Local Board No. — County or City of — State of —

SECTION II.—LOCAL BOARD EXAMINATION AND CLASSIFICATION. (Fill out Items 18 and 19 for only those registrants for whom required and Item 20 for each registrant for whom Form 221 is prepared.)

18. To be filled in by local board:

(a) List all defects or diseases claimed by the registrant .....

(b) Are any of the defects or diseases listed in Item 18 (a) included in the List of Defects (Form 220)? Yes ☐ No ☐

(c) Registrant or affidavit referred to local board examining physician: Yes ☐ No ☐

19. Statement of local board examining physician:

(a) ☐ Registrant appeared in person.

(b) ☐ Registrant was unable to appear in person because of physical defects as follows: .....

(c) I have personal professional knowledge of the defect or defects specified in (e) below.

(d) ☐ Affidavits or statements were attached to the original Form 221 specifying the defects indicated in (e) below.

(e) Findings:

☐ Registrant does not have a defect listed in Form 220.

☐ Registrant has defect or defects listed in Form 220 as follows: (List in order of significance): .....

(f) Signature of examining physician .....

(g) Place ..... (h) Date .....

20. Determination of local board:

(a) Registrant classified in Class ..... (b) Date of classification .....

SECTION III.—MISCELLANEOUS (To be filled out at Induction Station for only those registrants accepted for military service)

21. (a) Organization and serial number of previous U. S. military service (if known) .....

(b) Reason for discharge .....

(c) Religious preference (voluntary for Army) .....

22. (a) Nearest relative (other than wife or minor child) (Name in full) .....

(b) Relationship ..... (c) Address .....
(Number and street or rural route, if none, so state) (City, town, or post office) (State or country)

(d) Person to be notified in case of emergency (Name in full) .....

(e) Relationship ..... (f) Address .....
(If friend, so state) (Number and street or rural route, if none, so state) (City, town, or post office) (State or country)

23. (a) The persons eligible to be my beneficiary are:

.....
(Full name of wife, if no wife, or if she is deceased or divorced, so state) (Wife's full address)

.....
(Full name and address of each minor child and each dependent child over 21 years of age)

.....
(If there are no children, so state. If the address is the same as the wife's, so state. Do not repeat address)

(b) In the event of my leaving no widow or child, I then designate as my beneficiary to receive the six months' death gratuity the dependent relative whose name, relationship and address are shown below:

.....
(If designation of beneficiary is declined, man must state in own handwriting: "I decline to designate any person as my beneficiary.")

(c) In the event of the death or disqualification of the last-named dependent relative, I then designate as my beneficiary to receive the six months' death gratuity, the dependent relative whose name, relationship, and address are shown below:

.....
(If beneficiary is named in line 23b but naming of alternate is declined, man must state in own handwriting: "I decline to designate an alternate beneficiary.")

24. (a) Signature of registrant .....
(First name) (Middle name) (Last name)

(b) Witnessed at ..... on ..... 19...

.....
(Signature of witness attesting) (Name of witness typed) (Grade and organization)

SECTION IV.—PHYSICAL AND MENTAL EXAMINATION

25. (a) High school graduate: Yes ☐ No ☒ (b) English speaking: Yes ☒ No ☐
(c) Qualification test (Form used 1) Score 15
(d) Group target score — (e) Individual examination —
(f) Non-English individual examination score —
(g) Illiterate: Yes ☐ No ☒
(h) Does registrant meet minimum intelligence standards: Yes ☒ No ☐

26. Limited classification: (a) 590: Yes ☐ No ☐ (b) Useful occupation: Yes ☐ No ☐
(c) Trade test: Name WSL
(d) R. I. test score
(e) If physically qualified for limited service, does registrant meet limited classification standards: Yes ☐ No ☐

27. Psychiatric diagnosis: normal
28. Neurological diagnosis: normal
29. Psychiatric or neurological symptoms: none
30. Eye abnormalities: none
31. Ear, nose, throat abnormalities: none
32. Mouth and gum abnormalities: none

33. TEETH: (a) Indicate restorable carious teeth by circling; nonrestorable carious teeth by /; missing natural teeth by X; teeth replaced by denture by horizontal line over X——; teeth replaced by fixed bridge by oval to include abutments (X)

Right								Examiner's							
8	7	6	5	4	3	2	1	1	2	3	4	5	6	7	8

(b) Remarks, including other defects: missing teeth and one restorable
(c) Prosthetic dental appliances: none

34. Skin: acne, mild
35. Varicose veins: none
36. Hernia: none
37. Hemorrhoids: none
38. Genito-urinary (nonvenereal): normal
39. Venereal diseases: none
40. Feet: normal
41. Musculoskeletal defects: amputation of thumb and three fingers on right hand
42. Abdominal viscera: normal
43. Cardiovascular system: normal
44. Lungs: normal
45. Chest X-ray: negative
46. Endocrine system: normal

SECTION IV.—PHYSICAL AND MENTAL EXAMINATION—Continued.

Do Not Use

67. MEDICAL HISTORY: (a) Has registrant had spells of unconsciousness, convulsions, fits, encephalitis, nervous trouble of any sort, tuberculosis, asthma, hay fever, diabetes, enuresis, stomach ulcer, rheumatic fever, heart trouble, migraine (recurrent sick headache), somnambulism (sleep walking); been treated at hospital, asylum, or sanitarium; is or has been addicted to alcohol, narcotics, or habit-forming drugs: Yes ☐ No ☒ If yes, specify .....

(b) Specify other defects or diseases claimed by registrant none

68. Other defects, diseases, and/or remarks none

69. Summary of defects: (a) Principal defect amputation of fingers
missing teeth
acne, mild

(b) Other defects in order of significance none

70. (a) I CERTIFY that the above-named registrant was carefully examined, physically and mentally, that the results of the examination have been carefully recorded on this form, and that, to the best of my knowledge and belief, he is—

(1) Qualified for general military service ☐

(2) Qualified for limited service ☐ because of .....

(3) Disqualified for any military service ☒ because of loss of fingers and thumb

(b) Signature of medical examiner Everett C. Daly

(c) Name typed or stamped EVERETT C. DALY (d) Title Captain, MC

(e) Place Baltimore, Maryland (f) Date 11 Jul 1944

SECTION V.—PHYSICAL INSPECTION AT TIME OF INDUCTION.

71. (a) Results (if different from Section IV, specify) .....

(b) Signature of medical examiner .....

(c) Place ..... (d) Date .....

SECTION VI.—DISPOSITION OF REGISTRANT BY ARMED FORCES.

72. Registrant's service preference: None ☐ Army ☐ Navy ☐ Marine Corps ☐ Coast Guard ☐

73. (a) I CERTIFY that the qualifications of the above-named registrant have been considered in accordance with the most recent regulations governing the acceptance of Selective Service registrants and that he was this date—

(1) Inducted into Army ☐ Navy ☐ Marine Corps ☐ Coast Guard ☐
and was ordered to report to .....
(Time) (Date)

(2) Rejected for service in the armed forces because of: Medical ☒ Moral ☐ Alien ☐
Other ☐ If other, specify .....

(b) Signature of inducting officer Everett C. Daly

(c) Name typed or stamped EVERETT C. DALY

(d) Place Baltimore Maryland (e) Date 11 Jul 1944

SECTION VII.—TRANSFER FROM RECEPTION CENTER.

74. Above-named man was transferred from Reception Center to—

..... on .....
(Place and organization, if known) (Date)

SECTION VIII.—FINGERPRINTS—RIGHT HAND (for only those registrants who are inducted).

Nonmedical	76,300	1.6

1/ Includes registrants in Classes II-A, B and C with "F" designation.
2/ Includes (1) registrants with more than one disqualifying defect who were rejected for educational deficiency prior to June 1, 1943; (2) registrants rejected for failure to meet minimum intelligence standards beginning June 1, 1943; (3) morons, imbeciles and idiots rejected November 1940-July 1945.

1430

METHODS USED IN COMPUTING COMBINED PREINDUCTION AND INDUCTION REJECTION RATES

The combined rates of rejection for registrants given preinduction examination and those reporting for induction appear in Tables 2, 3, and 4 of the text, in the section on Rejection Rates. These combined rates were calculated as follows:

1. Of one hundred registrants ordered to report for preinduction examination:

   a. If 40 were rejected on preinduction examination, 60 would be forwarded for induction;

   b. If 10 percent of the 60 registrants were rejected at the induction station, then 6 registrants would be rejected when they reported for induction;

   c. Hence, out of the original 100 registrants ordered for examination, 40 were rejected on preinduction and 6 at the induction station, making a combined total of 46 rejected out of 100 examined, or a rejection rate of 46 percent.

Table 1. Results of Preinduction and Induction Examination, by Month and Race
February 1944-December 1944

Month of Examination	Results of Preinduction Examination			Results of Induction Examination		
	Examined	Rejected 1/	Rejection Rate 2/	Examined	Rejected 1/	Rejection Rate 2/

2576 DEFENDANT'S EXHIBIT 21

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER AND CASSELBERRY, INC., A California corporation,
Plaintiff,

v.

OSCAR R. EWING, Administrator, Federal Security Agency, et al.,
Defendants.

Washington, D. C., Friday, April 15, 1949.

Deposition of Dr. Elmer M. Nelson, a witness of lawful age, called for examination by counsel for the Plaintiff, pursuant to notice, copy of which is attached to the Court copy of this deposition, and subsequent stipulation of counsel set for the day and date herein indicated, in Room 4801, South Building, Department of Agriculture, Washington, D. C., beginning at 2:05 p.m., before Ida Z. Watson, a Notary Public in and for the District of Columbia, when were present on behalf of the respective parties:

Charles S. Rhyne, Esq., and Eugene J. Bradley, Esq., Attorneys for Plaintiff.

2577 Vincent A. Kleinfeld, Esq., and William W. Goodrich, Esq., Attorneys for Defendants.

PROCEEDINGS

Mr. RHYNE: For the record, I have given the reporter the notice under which we are taking this deposition, but by stipulation of counsel we are not taking this deposition on the 21st in accordance with the notice, but are taking it today, because Dr. Nelson must go to Europe and will not return until the day of the trial.

I believed that is agreed to, isn't it, Mr. Kleinfeld?

Mr. KLEINFELD: That is right.

Mr. RHYNE: So we are waiving the provisions of notice on that.

Whereupon—ELMER M. NELSON, a witness of lawful age, was called for examination by counsel for the Plaintiff, and after having been sworn by the Notary was examined and testified as follows:

Examination by Mr. Rhyne:

Q. Will you state your name and address?

A. Elmer M. Nelson, 1830 Jackson Street, Washington, D. C.

2578 Q. What is your official position?

A. I am Chief of the Division of Vitamins of the Food and Drug Administration.

Q. Have you ever heard of the product Nutrilite Food Supplement?

A. I have.

Q. When did it first come to your attention?

A. I have no definite recollection of that. I have to deal with so many products that the name probably didn't impress me the first time I saw it; but I do recall that I have seen the name at least six months ago.

Q. Doctor, can you recall why it first came to your attention?

A. Samples of the product, Nutrilite, were submitted to this Division for examination to determine whether or not the vitamin content was in accordance with that claimed; and that was more than six months ago. I don't recall the date. I recall having seen a record of that recently.

Q. I notice, Dr. Nelson, in the affidavit which has been filed in this case, which you will recall you gave on January 17, 1949, that you say that your Division "is charged with the responsibility of offering opinions with respect to the propriety of statements
2579 pertaining to nutrition, including vitamins, and the labeling of products that come within the purview of the Food, Drug and Cosmetic Act." You recall that statement; do you not?

A. Yes, I do.

Q. And that is the function of your office?

A. That is a part of the function of this office.

Q. Have you had occasion to examine the booklet, "How To Get Well and Stay Well," that is used in the sale of Nutrilite Food Supplement?

A. Yes, I read that pamphlet at one time.

Q. Do you recall when you read it, Doctor?

A. All I can say is it was months ago. I don't recall. It was within the past year, but just when, I do not recall.

Q. Did you render an opinion on whether that particular booklet complies with the Food, Drug and Cosmetic Act?

A. I don't believe I was asked to offer an opinion on that.

Q. If you had been asked to render an opinion on that, Doctor, how would you go about making that decision?

Mr. GOODRICH: Object on the ground that the question is speculative, calling for a speculative answer.

Mr. KLEINFELD: And is irrelevant.

Mr. RHYNE: Off the record.

2580 (Discussion off the record.)

Mr. RHYNE: On the record.

THE WITNESS: Well, the procedure for determining whether or not the statements made therein are misleading, in terms of the Food, Drug and Cosmetic Act, would be no different from that of any other piece of literature, pamphlet or labeling.

We read what the statements are and attempt to see what impression they would create in the minds of the readers; and see if there is anything of a misleading nature about them or any false statement in the literature.

By Mr. Rhyne:

Q. In determining whether or not a statement is misleading, or false, do you consider official Government publications and medical books and literature in the field with respect to a particular representation?

A. Yes, I do.

Q. Do you consider anything else?

A. Consider all the knowledge that is at my command, I might say, anything I may have read, anything of my own personal experience in conducting investigations, the opinions of various authorities in the field whom I have consulted on the subject and discussed it with them.

Q. You have been Director of this Division for quite a
2581 while, haven't you, Doctor?

A. I have been Chief of this Division since 1935.

Q. In considering these publications and this knowledge of which you speak, do you strive to arrive at what I have seen referred to as the "consensus of medical opinion"?

A. It wouldn't necessarily be the consensus of medical opinion. It would be the best opinion that I could find in medicine that relates to that particular subject.

Q. What do you understand by the term "consensus of medical opinion"?

A. Well, what most men in the field of medicine would agree to.

Q. That is, the majority of them?

A. Yes, I should think that would be the consensus of opinion.

Mr. RHYNE: I have noticed the use of the term and I was wondering just what your office considered that it meant. That is the reason for my question.

By Mr. Rhyne:

Q. Now, are you called upon to determine whether particular literature is false, as distinguished from misleading?

A. Yes, I am.

Q. How would you make such a distinction?

2582 A. It would depend entirely upon the statements made. In a statement dealing with scientific facts, it is quite obvious in certain cases whether a statement is one that conforms with the facts that are established or not. A statement may be misleading when it is not false.

There are many examples that can be given of that. One that I have used in discussing labels would be a statement such as a person saying, "One of your parents is white," implying that the other one is not. Well, that statement is a statement of fact, but it is still misleading.

Q. I see. Now, are you called upon to distinguish misleading statements and fraudulent statements; and if so, how do you distinguish between the two?

A. Well, I don't know that I am called on particularly to determine whether a statement is fraudulent or not.

Q. Well, if that is not within your duties, you don't render opinions on it, I won't press the question.

A. I may have occasion to review a record that deals with something fraudulent, but whether or not it is fraudulent is more a legal matter than it is a scientific matter.

Q. And you are not a lawyer, are you?

A. No, sir.

Q. Now, in arriving at these opinions which it is the

2583 function of our office to render, you are always measuring particular literature or labeling against the established medical facts in a particular field, say, in the field of vitamins? With respect to Nutrilite, in measuring Nutrilite's literature, you read that literature and determine the claims that you think are made for it, and then you measure those claims against this consensus of medical opinion, so to speak, in the field, to determine whether the claims are correct?

A. Or the conclusions that I have arrived at as to what I believe to be the correct statement.

Q. I mean, you would think that there is some way of establishing whether your conclusions are correct with reference to the literature in the field, for example?

A. Yes, to some extent, but without a certain amount of fundamental knowledge, you are not able to judge whether the literature that is available to you is expressing the facts correctly or not; and

I do not hesitate to impose my own judgment on anything that I have occasion to review.

Q. But you don't think you have to be a medical doctor in order to review this literature and determine the consensus of medical opinion with respect to a particular vitamin?

Mr. KLEINFELD: We object to that on the ground it is irrelevant.

2584 Mr. RHYNE: Will you read the question?

(Whereupon the question was read by the reporter.)

THE WITNESS: I do review the literature and consider when it is available, what the consensus of medical opinion is, but I do not necessarily rest my opinion on any particular piece of literature or statement by any group of individuals.

By Mr. Rhyne:

Q. My question is, in your opinion, you don't have to be a medical doctor in order to review this literature and arrive at such an opinion?

A. No, sir.

Q. Now, Doctor, in the course of your duties, do you have to determine whether particular labeling is misleading in a material respect to the injury or damage to a purchaser or consumer?

Mr. KLEINFELD: We will object to that on the ground it is irrelevant and not involved in the issues in this case.

THE WITNESS: Shall I proceed?

Mr. KLEINFELD: Yes.

By Mr. Rhyne:

Q. Yes.

A. My job is primarily to state what I believe the scientific
2585 facts are, so our administrative officers can reach a conclusion with respect to that.

Q. But you do determine whether particular literature is misleading?

A. I offer an opinion, yes, sir.

Q. And misleading in a material respect?

A. I have never given any consideration to that particular language, "in a material respect." I have never been asked to answer in that particular language.

Q. Have you considered the language "in a material respect to the injury of a purchaser"?

Mr. KLEINFELD: Again I object on the ground that it is irrelevant and not Dr. Nelson's function to make such determinations under the statute.

THE WITNESS: I don't recall that I have been asked to offer such an opinion.

By Mr. Rhyne:

Q. You don't consider injury to the purchaser?

A. I do consider injury to the purchaser, but not in the terms of whether it is in a material respect or not.

Q. Well, when you are considering injury to the purchaser, for example, with respect to labeling such as that in the booklet, "How To Get Well and Stay Well," how would you go about arriving at an opinion as to whether or not such a booklet is or is not injurious to a purchaser or consumer?

2586

A. First of all, I would consider whether the product, itself, if taken in accordance with the recommendations for use, would be likely to produce any injurious effect. I would consider also whether the recommendations or representations for the product are such that a person might rely on such a product to ameliorate a disease or cure it, and whether or not that product would be capable of doing anything for such disease.

Q. And considering those factors you have just named, you would determine whether or not there was injury to the purchaser or consumer?

A. Whether there may be injury, yes.

Q. Would you consider whether the injury is direct or indirect?

A. That is right.

Q. Now, do you consider whether or not your office—and when I refer to "your office," I mean the Food and Drug Administration—has received complaints from purchasers or consumers? Is that a factor in your judgment?

MR. KLEINFELD: I object to that question on the ground that it is not relevant.

THE WITNESS: Certainly I would give consideration to any complaints and try to learn the basis for such complaints, if I was considering a question of injury from the product.

2587

By Mr. Rhyne:

Q. That would be one of the factors that you would certainly take into consideration?

A. Well, I certainly would not ignore any complaint about a product being injurious.

Q. Doctor, have you discussed Nutrilite with Mr. Ewing?

A. No, sir.

Q. Have you discussed it with Mr. Kingsley?

A. No, sir.

Q. Have you discussed it with Dr. Dunbar?
A. No, sir.
Q. Have you discussed it with Mr. Larrick?
A. No, sir.
Q. Have you discussed it with Dr. Butz?
A. No, sir.
Q. Could you recall the persons whom you have discussed Nutrilite with?
A. I have discussed it with Mr. Kneeland, K-n-e-e-l-a-n-d.
Q. Who is Mr. Kneeland?
A. He is in the office of the Administrator of the Federal Security Agency.

2588 Q. Can you recall what you told Mr. Kneeland about Nutrilite?
A. No, I wouldn't be able to recall what I have said. I have had many telephone conversations with him with respect to that product.
Q. Can you recall the substance of the telephone conversations?
A. I think the discussion that is pertinent here was primarily questions that he posed to me that related to the representations made in a pamphlet dealing with the product, Nutrilite, and I gave him my opinion with respect to the representations made therein and to various other questions that he asked me to provide a basis for his consideration of the product.
Q. When you said a few moments ago, then, that you had never really been called upon to render an opinion on the labeling of Nutrilite, you meant that you had not been called upon to render an opinion on the pamphlet as a whole?
A. That is right.
Q. You were asked by him about specific passages of the pamphlet?
A. Yes.

2589 Q. Did you have the entire pamphlet before you at the time?
A. No, not at that time, not in my discussions with him. It is possible that I may have had the pamphlet at some time, but if so, it is quite a long time ago, and I just do not recall the circumstances.
Q. Doctor, I am going to hand you a pamphlet which I will have marked as Exhibit A.

Mr. RHYNE: I would like to have the consent of counsel to replace it later, because it appears to be a marked copy that I brought by mistake, Mr. Kleinfeld, rather than the copy I intended to bring. It is the 42-page pamphlet that we are all familiar with.

(Whereupon the said pamphlet was marked Exhibit A.)

Mr. KLEINFELD: Is that the Exhibit A that was attached to Plaintiff's original complaint?

Mr. RHYNE: Yes; it is identical. I would like to replace it with one that is not marked up.

Mr. KLEINFELD: Fine.

By Mr. Rhyne:

Q. I will ask you whether or not that is the pamphlet you had occasion to review?

A. Yes, this appears to be the pamphlet. I am not sure that I have read all of this, but I was requested by someone
2590 outside of the Food and Drug Administration to look at certain passages and offer an opinion on it.

Q. Can you advise me the name of the person who made that request of you?

A. The name is Mr. Field.

Q. And can you identify him further as to who he is employed by?

A. Employed by the American Medical Association.

Q. Mr. Field submitted a copy of this to you and asked your whether or not it was misleading in violation of the Food, Drug and Cosmetic Act; did he?

A. No, sir.

Q. What did he ask you, Doctor?

A. He asked me to review certain parts of this, something like the first ten pages, and then another part that dealt with vitamins specifically and offer my opinion with respect to the statements made therein.

Q. Did you give your opinion?

A. I did.

Q. What was your opinion, Dr. Nelson?

A. Well, I would have to review this material again.

Q. You didn't do it in writing?

A. Yes, I did it in writing?

2591 Q. Could I have a copy of it?

Mr. GOODRICH: I object to the production of any records on the ground that they are records of the Food and Drug Administration and not under the control of this witness. He is prohibited by Regulation 21, Code of Federal Regulations, Section 196.1, from revealing this information otherwise than with the permission of the Administrator of the Federal Security Agency.

Mr. RHYNE: I ask Mr. Kleinfeld and yourself, as attorneys for the Administrator, to waive that regulation at this time.

Mr. KLEINFELD: We have no authority to waive that regulation.

Mr. RHYNE: I also call your attention to the fact that this witness appears under a subpoena that requires him to produce the records in his possession that relate to Nutrilite Food Supplement.

By Mr. Rhyne:

Q. I ask you, Dr. Nelson, whether this communication is in your possession?

Mr. GOODRICH: We have stated that the records are not in the possession of Dr. Nelson; they are in the possession of the Federal Security Agency. They are official Government records and
2592 are not in the control of any person. For that reason, we object to his giving them.

Mr. RHYNE: I will have to have an answer as to whether or not these records are in his possession or in the possession of his Division.

Mr. GOODRICH: He can answer the question. You may answer.

THE WITNESS: This particular letter is a part of the correspondence with the Council on Pharmacy and Chemistry of the American Medical Association. I don't know whether I have that letter here or whether I have it at home.

By Mr. Rhyne:

Q. And the name of that counsel is Mr. Field?

A. No, sir.

Q. Could you give me his name?

A. When I was speaking of a Council on Pharmacy and Chemistry, that is the name for a group of men; and Mr. Field is one of the men in the office of that organization.

Q. To whom would the particular communication have been addressed, Doctor?

Mr. KLEINFELD: The Government objects to all this line of questioning on the ground that it is entirely irrelevant; that the issue in this case, as phrased in pre-trial conference, is whether the labeling
2593 of this product is misleading in a material respect; and that all these questions addressed to Dr. Nelson have no relevancy with respect to that issue.

Mr. RHYNE: I reply, of course, that this particular opinion was addressed directly to that specific issue, and ask that Dr. Nelson answer my question as to whom the particular communication was addressed.

THE WITNESS: Shall I answer that question?

Mr. KLEINFELD: Surely.

THE WITNESS: The communication was addressed to a Mr. Field, who is in the offices of the Council on Pharmacy and Chemistry of the American Medical Association.

By Mr. Rhyne:

Q. Can you recall approximately the date of the communication, Doctor?

A. I believe it was in January of this year.

Q. Would you say that the communication indicated that this particular 42-page pamphlet was or was not misleading?

A. Oh, that it was misleading. There were misleading statements in it; the general impression that you gain from reading it is rather misleading.

Q. Did you point out any particular injury or damage to any purchaser or consumer in that communication?

A. No, sir.

2594 Q. Did you determine whether it was misleading in a material respect in that communication?

A. I don't know how to answer that question, sir. I don't know what you mean by "material respect."

Q. In other words, you can't understand the term, "misleading in a material respect"?

Mr. KLEINFELD: I object to that question as entirely irrelevant.

THE WITNESS: I do not know what you mean by the difference between "misleading" and "misleading in a material respect."

By Mr. Rhyne:

Q. Doctor, can private companies submit to you their labeling and get your stamp of approval on that labeling to the effect that it doesn't violate the Food, Drug and Cosmetic Act?

Mr. KLEINFELD: I object, Dr. Nelson isn't qualified to answer that question. He is not the head of the Food and Drug Administration; and it is irrelevant to the issue here.

Mr. RHYNE: In reply, I say he signed an affidavit on the 17th of January, 1949, stating that he is charged "with the responsibility of offering opinions with respect to the propriety of statements pertaining to nutrition, including vitamins, and the labeling of products that come within the purview of the Food, Drug and Cosmetic Act."

2595 Mr. KLEINFELD: Well, why don't you ask him that question instead of the question you asked him?

Mr. RHYNE: Will you read the question I asked?

(Whereupon the question was read by the reporter.)

Mr. KLEINFELD: I will object to that.

Mr. RHYNE: No, I will not amend it; I would like an answer.

Mr. KLEINFELD: Go ahead.

THE WITNESS: Labels are not submitted to me directly. They may be submitted to the Food and Drug Administration, and in the course of consideration, I may have occasion to comment on

them; but one on the staff of the Food and Drug Administration will offer an opinion to the firm whether or not the label conforms with the requirements of the Food, Drug and Cosmetic Act.

By Mr. Rhyne

Q. Does the same thing apply to labeling, that is, advertising, as well as labels?

A. Not advertising, but what is considered label or labeling in terms of the Food, Drug and Cosmetic Act will be commented on.

Q. Are those approvals binding in any way?

Mr. KLEINFELD: I object. It calls for a legal conclusion
2596 of the witness and is irrelevant.

By Mr. Rhyne:

Q. I will change the question. Do you know of any instance where labeling has been approved by the Food and Drug Administration and later disapproved?

A. Labeling is never approved by the Food and Drug Administration. We have no such authority under the law.

Q. Doctor, do you think that actual experience with the product, as reported by doctors in medical journals, is one of the best ways to arrive at its value, say, in the field of nutrition?

Mr. KLEINFELD: That is objected to as irrelevant.

THE WITNESS: No, sir.

By Mr. Rhyne:

Q. You don't think that experience with the product is the best way to arrive at its value?

A. No, sir.

Q. What do you think is the best way?

A. If you are trying to ascertain the value of a product for a particular condition, what is needed is carefully controlled clinical studies where you can have groups of patients to compare, so that you can establish definitely whether the product is of any value.

2597 Observations of patients at random is of relative little value.

Q. You don't think, then, that if 30,000 people used a particular product and reported beneficial results from it that that would prove that the product was beneficial for the things they reported?

Mr. KLEINFELD: I object to that as being irrelevant and calling for a conclusion of the witness which he isn't qualified or supposed to answer. Go ahead.

THE WITNESS: Certainly not.

By Mr. Rhyne:

Q. In other words, you give no value whatever to actual experience with a product?

Mr. KLEINFELD: I object on the same ground, that it is leading, and not phrased correctly. Would you mind stating the question again, subject to that objection?

Mr. RHYNE: Read the question.

(Whereupon the question was read by the reporter.)

THE WITNESS: I do not agree to what is implied in that question. I would give consideration to experience gained with a product, but experience may be obtained under such conditions that the people who use a product may be entirely misled with respect to
2598 what value may accrue from the use of the product; and I have seen instances of that.

By Mr. Rhyne:

Q. Do you believe, Doctor, that such a thing as deficiency diseases exist?

A. Yes, sir. It isn't a matter of belief; I know they exist.

Q. I have marked as Exhibit B a page from a volume known as "Modern Home Medical Adviser," by Dr. Fishbein, of the American Medical Association, whom I am sure you know. It is Page 504, relating to deficiency diseases. I ask that you examine this page and state whether or not you agree to the facts set forth thereon?

(Whereupon the said document was marked Exhibit B.)

Mr. KLEINFELD: I wish to object to this unless the entire document from which this is taken is submitted to Dr. Nelson.

Mr. RHYNE: All right, I submit the document.

Mr. GOODRICH: We also object on the ground that this is improper direct examination, to present to a witness a medical book on which he has not stated that he relied, and ask for an opinion on that.

Mr. KLEINFELD: Go ahead.

THE WITNESS: May I have the question read again?

2599 (Whereupon the question was read by the reporter.)

Mr. GOODRICH: We object further on the ground that this question asks this witness, who is not an M.D., for a medical opinion, which he has not been qualified to express.

Mr. RHYNE: I say, I am not asking him to express an opinion as an M. D., merely as head of the Vitamin Division of the Food and Drug Administration.

Mr. KLEINFELD: Well, we repeat that objection in that he is well qualified to head the Vitamin Division, but he is not an M. D. and, therefore, isn't qualified to discuss diseases.

THE WITNESS: Shall I go ahead?

Mr. GOODRICH: Yes.

THE WITNESS: I do not agree with a number of the statements made under the headings, "Excellent Purposes," and "Deficiency Leads To."

Under the heading, "Excellent Purposes" is the representation, "Promotes growth and vigor."

By Mr. Rhyne:

Q. Do you say that statement is either false or misleading?

A. It is misleading.

Q. Why?

2600 A. Because it leaves the impression that if a person shows lack of vigor or lack of growth, if he will take this vitamin, it will promote growth and vigor; and it will not necessarily do so.

In the absence of Vitamin A in the diet or in the case of Vitamin A deficiency, there is depression of growth and there may be loss of vigor.

Q. Are there any other statements in there that you say are misleading or false?

A. Yes. In the column headed, "Deficiency Leads To," and this refers to Vitamin A, also, are the statements, "Loss of vigor," and "Failure of growth of children."

I am sorry, I did not regard that in terms of the heading. It is proper to make those statements under that heading.

Under the heading, "Excellent Purposes," and relating to Vitamin B, is the statement, "Promotes appetite and digestion."

I see there are two headings; one is Vitamin B and the other one B-1. This refers specifically to Vitamin B-1. The taking of Vitamin B-1 will not necessarily promote the appetite or promote digestion. It is true that with a deficiency of Vitamin B-1 appetite may be depressed and digestion may not be proper; but there are many cases in which there is lack of appetite or poor digestion

2601 which will not be relieved by injection of Vitamin B-1.

Following the statement, "Promotes appetite and digestion," is "Stimulates body activity." The same type of criticism is applicable to that statement as to the statement, "Promotes appetite and digesion," and "Promotes growth and vigor," that I referred to before.

Q. Well, Doctor, do you think that those statements in that book are materially misleading?

Mr. KLEINFELD: That is objected to as being irrelevant.

THE WITNESS: They are misleading to the extent that a person reading this—and this is directed to people in the home—would definitely be misled by such a statement.

By Mr. Rhyne:

Q. Do you think they would be misled to their injury or damage?

A. They may be. The statement is also made, "Overcomes some forms of neuritis." An individual may consider various aches or pains that he may have as being neuritis, and neuritis may, in some instances, be due to Vitamin B-1 deficiency, but more frequently due to other causes.

Q. On what do you base that conclusion, Doctor, your reading of medical and other journals?

A. Yes, sir.

2602 Q. All right. Is there anything else in there that you object to?

A. Yes, sir. Under Vitamin B-2, or Riboflavin, in the column headed, "Excellent Purposes," is the statement, "Extrinsic factor in pernicious anemia (Castle)." That is not true.

Q. You say the statement is false?

A. Yes.

Q. You again base that upon writings in medical journals and your own experience in this field?

A. Yes, sir. In the reference to Vitamin E, under the column "Excellent Purposes," is the statement, "Necessary for reproduction in animals and man," with a question mark. There is absolutely no evidence that Vitamin E is necesary for reproduction in man, and it is not necessary for reproduction in some animals.

Q. Is there not a conflict of opinion on that, Doctor, in the medical journals and scientific writings?

A. Well, there may be some difference of opinion in certain writings; but in the best literature, I don't believe there is any difference of opinion with respect to what I have stated. The evidence with respect to cattle is certainly to the effect that Vitamin E is not needed.

2603 Q. When you refer to "the best literature," what literature do you have particularly in mind?

A. Well, I was referring to scientific journals such as the "Journal of Nutrition," the "Journal of Biological Chemistry," the "Biochemical Journal" that is published in England, and similar scientific journals.

Q. "The American Medical Association Journal," would you classify that in the same category?

A. Not in the same category, because that journal publishes articles of findings, recognizing that what may be published in there may readily be disproven in later articles. Things that are more or less experimental in nature, rather than critical investigations such as those that are published, for example, in the "Journal of Nutrition."

In the last section of the table, the bottom of the page, relating to Vitamin B Complex is the statement, "Pantothenic acid (filtrate factor) is related to graying of hair in human beings." I do not agree with that statement, because all of the critical studies with which I am familiar have demonstrated that pantothenic acid is of no value in preventing the graying of hair or restoring the color of gray hair in man.

Q. You say that statement, because you don't agree with it, is misleading?

2604 A. Yes.

Q. There could be others who would think it is not misleading, like the authors of that volume.

A. There could be, yes.

Q. I mean, you don't say that they put the statements in there to mislead anyone?

Mr. KLEINFELD: I object; that is entirely irrelevant.

THE WITNESS: The statement I quoted is followed by the statement, "Vitamin B-6 (pyridoxine) is related to some chronic nervous disturbances." I do not agree with that statement.

By Mr. Rhyne:

Q. Other than that, you think that the facts set forth on the page are true and accurate?

A. I have only given this a rather cursory review and I am not sure that there are not other statements in here that I do not agree with; but I think those are the principal ones.

Q. Do you know the authors of the particular article, Doctor?

A. Yes, sir.

Q. Are they well-known persons in the field of nutrition, vitamins?

A. Not particularly well known in the field of nutrition.

2605 The senior author is Dr. Russell M. Wilder, whose specialty is internal medicine at the Mayo Clinic. He has been interested in nutrition in recent years; but I am not sure that he has made a thorough study of all of the available literature with respect to vitamins.

Q. What about the other author, Dr. Butz?

A. The work of Dr. Butz that relates to nutrition, so far as I know, relates only to Vitamin K.

Q. You don't think he is particularly well qualified, then, to write an article and come to the conclusions that are set forth there?

A. I don't think that either one of the authors is well qualified to make statements of this kind on the basis of their own experience and observations; but they should be well qualified to make a survey of the literature.

Q. Is it your opinion that they have read the literature wrong and come to the wrong conclusions?

Mr. KLEINFELD: I object to that line of questioning as being entirely irrelevant, calling for conclusions which have no bearing on this case. Go ahead.

THE WITNESS: I can reach no other conclusion, sir.

By Mr. Rhyne:

2606 Q. Dr. Nelson, have you read any literature of Mytinger and Casselberry or any literature relating to Nutrilite Food Supplement other than this pamphlet, "How to Get Well And Stay Well," which has been marked Exhibit A?

A. Not according to my present recollection, sir.

Q. Do you have any employes under your direction who have been investigating Nutrilite or the labeling of Nutrilite?

A. Not investigating the labeling, but men who have made analyses of samples of Nutrilite.

Q. That is to determine whether or not it actually contains the contents set forth on its label?

A. Yes, sir.

Q. Have you seen any complaint from any user or purchaser of Nutrilite to the effect that he has been injured by it in any way?

Mr. KLEINFELD: Objected to as being irrelevant.

THE WITNESS: I do not recall seeing any.

By Mr. Rhyne:

Q. Have any of these employes under your direction made any field investigations of Nutrilite?

A. No, sir.

Q. None of the inspectors of the Food and Drug Administration are under your direction?

A. No, sir.

2607 Q. Do you have any facts or have any facts been submitted to you at any time showing injury or damage to any person from the labeling of Nutrilite?

Mr. KLEINFELD: Objected to as being irrelevant and incompetent.

THE WITNESS: No, sir.

By Mr. Rhyne:

Q. Are you familiar, Doctor, with the vitamins and minerals that are contained in Nutrilite Food Supplement?

A. I have read the label.

Q. They are set forth in your affidavit?

A. Yes, sir.

Q. Of January 17, 1949.

A. Yes, sir.

Q. Are there not vitamins and minerals in Nutrilite which could aid in curing or preventing or assisting in the cure of deficiency diseases, certain deficiency diseases?

A. There are.

Q. Could you name the deficiency diseases specifically that you think it could aid in curing or preventing or assisting in the cure of?

A. Cases of Vitamin A deficiency, Vitamine B-1 deficiency, Vitamin B-2 deficiency, Vitamin C deficiency, Vitamin D
2608 deficiency, possibly in the case of Vitamin K deficiency there is sufficient niacinamide to be of value in the prevention of a niacinamide deficiency; but the amount would probably be of little or no value in the cure of pellagra, which is due to a deficiency of that vitamin.

Q. How about the minerals in Nutrilite, Doctor?

A. The quantities of iron and calcium are of about the order of the daily requirement for the adult; the phosphorous is a little less than that; and the amount of iodine in the recommended daily intake is considerably in excess of the established daily requirement.

Q. Doctor, did you help prepare any affidavits for Dr. Dunbar or Mr. Larrick with reference to Nutrilite for use in Court?

A. No, sir.

Q. I believe you have said that there is no one in your Division who worked on the Nutrilite labeling as distinguished from its label?

A. That is right?

Q. Just on the label. Doctor, isn't it true that the literature, scientific literature indicates that a material proporion of our popu-
lation suffers from one or more vitamin or mineral deficiencies?

2609 A. May I have that question read?

(Whereupon the question was read by the reporter.)

THE WITNESS: In the literature, we find various statements indicating widely different opinions with respect to the extent of vitamin and mineral deficiencies.

If one looks at the literature that appeared ten to fifteen years ago, there are indications that vitamin or mineral deficiencies would be quite widespread. The opinions that are expressed on the basis of recent surveys are to the effect that vitamin and mineral deficiencies are much less common than they were ten years ago.

The evidence from medical literature with respect to the actual occurrence of deficiency diseases is to the effect that there are very few cases of deficiency diseases.

By Mr. Rhyne:

Q. Doctor, I have had called to my attention a Technical Bulletin No. 963, entitled, "Efficient Use of Food Resources in the United States," dated October 1948, by Raymond P. Christensen, Agricultural Economist, Bureau of Agricultural Economics, United States Department of Agriculture, in which I noted this statement:

Mr. GOODRICH: I object to examination with this pamphlet on the ground it is not a recognized medical treatise. This
2610 man is not an M.D. who is being examined; and this is improper direct examination in that it is an effort to place into the record here statements from an Agriculture Department publication.

By Mr. Rhyne:

Q. Doctor, the statement made in this Technical Bulletin No. 963 is this:

> "Estimates made from the 1942 study indicate that one-half of all families did not have diets that met recommended allowances for riboflavin, one-third did not meet the allowances for calcium, one-fourth for thiamin, and about one-tenth for ascorbic acid, Vitamin A, iron and protein."

I take it from what you just said, you disagree with that?

A. Disagree with the opinion?

Q. Yes.

A. I do disagree with that opinion, because that is based on a survey made in 1942. Recent surveys have shown quite different results.

The recommended dietary allowance for riboflavin for the adult to which the author probably refers is a figure given by the Food and Nutrition Board of the National Research Council of 3 milligrams of riboflavin a day; and it is now very well agreed that
2611 such an amount of riboflavin is not required or not necessary; and the recommended dietary allowance has been reduced to less than 2 milligrams a day, I believe, for the adult. It is either 2 or 1.8, which would make a considerable difference in estimating the frequency with which diets failed to meet such a standard.

Also, the statement with respect to Vitamin C, only one-tenth of the diets meeting that standard, means nothing with respect to the frequency of deficiency of Vitamin C and the incidence of scurvy, because the actual requirement for Vitamin C has been demonstrated by very thorough researches on man in England to be of the order of 10 to 15 milligrams a day, whereas the recommended dietary allowance of the Food and Nutrition Board of the National Research Council is 75 milligrams a day.

So it makes no difference, makes relatively little difference that only one-tenth of the diets may meet the standard of 75 milligrams a day if the actual requirement is less than 15 milligrams a day.

Q. I take it you are familiar with that study to which I referred there, but it was not cleared through your Administration before it was released?

A. I am not familiar with the publication to which you
2612 refer. I am familiar with surveys that were made by the Department of Agriculture in 1935 to 1939, and then a rather limited survey that was made in, I believe, the spring of 1942; and I think that is the survey to which the author refers.

Q. Now, Doctor, I am going to ask you certain questions about the affidavit that you made on the 17th of January, 1949. Do you have a copy of that?

A. Yes, sir.

Q. You might follow these questions better if you have it in front of you. First of all, calling your attention to Paragraph 4 in the affidavit, in which you set forth a chart comparing Nutrilite with two other vitamin products, how did you procure the figures which you list in that chart which apply to Nutrilite?

A. That figure was given to me as a figure by Mr. Kneeland, I believe, with respect to what it cost to obtain a year's supply of Nutrilite.

Q. That is Mr. Kneeland of the Administrator's office?

A. Yes, sir.

Q. Was that chart represented to you as containing all the vitamins and minerals in Nutrilite?

A. Well, no. I had before me the label for Nutrilite.

Q. So you knew it did not contain all the vitamins and
2613 minerals which are contained in Nutrilite?

A. This is not a complete list of all of the vitamins and minerals that are in Nutrilite.

Q. For example, I notice that you omit Vitamin B-6, Vitamin E, Vitamin K, pantothenic acid, inositol, and paramino-benzoic acid. Those that I have just mentioned are omitted from the chart, Dr. Nelson?

A. Yes, sir.

Q. Now, the product that you have listed there as Unicaps does not contain any minerals; does it, Doctor?

A. Well, not in any quantity that should be regarded. There is calcium present in here as calcium pantothenic, but that should not be regarded as a source of minerals.

Q. Can you compare two products, one of which, like Nutrilite, does contain minerals, and the other one containing no mineral substance at all?

A. No; and I would like to say in that connection, you can't make an accurate comparison between two products that are not of the same composition. That applies to vitamins, as well; but in making this comparison, I disregarded the vitamins that are not known to be needed in human nutrition; and the heading of the chart is, "Comparison of Vitamin Content and Cost of Vita-
2614 min preparations." It really refers to vitamin content rather than mineral content.

Q. Is it your statement that Vitamin B-6, Vitamin E, Vitamin K, pantothenic acid, inositol, and para-amino-benzoic acid were not listed because they have no value?

A. Yes. That is referred to later in Paragraph 9, on Page 3 of the affidavit.

Q. Now, is it not true, Doctor, that the National Research Council figures in your chart are the daily recommended average in-take of vitamins?

A. No, sir.

Q. Could you explain what they are; what the figures really represent?

A. They are amounts that are recognized to be considerably in excess of actual requirements for the vitamins, and they are recognized as quantities that are readily obtainable from ordinary diets. That is the basis for them.

Q. Well, as compared to Nutrilite's figures in the same chart, is it not true that the Nutrilite figures are more of a therapeutic in-take recommendation rather than average?

A. That is true.

Q. The National Research Council recommendation is not of that character; is it?

A. It is not.

2615 Q. Do you think it is valid to compare two sets of figures that apply to different circumstances?

A. Well, not if you do it in such a way as to mislead anyone; but I didn't think I was misleading anyone. I certainly didn't intend to in the way I expressed these figures. I give the source of the information; and the figures of the recommended dietary allowance are very widely used and very well known in the field of nutrition.

Q. But you do recognize the difference in the two?

A. Oh, yes.

Q. Can you tell me how old the National Research Council figures are? When was this recommendation made?

A. These figures conform with the current recommended dietary allowances and were adopted in a meeting in the spring of last year; published first about August of last year.

Q. Referring to Paragraph 9 that you mentioned a few moments ago, you say:

"The above-listed vitamins and minerals are recognized by the Food and Nutrition Board of the National Research Council as essential in human nutrition."

The chart also shows that this Vi Syneral contains fewer units of Vitamin C than that recommended by the National Research Council, and is lacking in elements of calcium and
2616 phosphorous. How can you compare these products with Nutrilite which contains amounts of vitamins and minerals in excess of those recommended by the National Research Council? Do you think that is a reasonable comparison?

A. These figures were intended to show the actual cost of a preparation as it is available on the market. The differences between the recommended dietary allowances and the composition of these three products that are mentioned, it seems to me, are obviously apparent by just examination of the table, that they are not of uniform composition.

Q. So you do recognize, then, it is not an exact comparison at all?

A. I never intended it to be an exact comparison. I do not so intend it to be now.

Q. Now, calling your attention to Paragraph 5 of your affidavit, Dr. Nelson, you refer to a "well-balanced diet." Can you define what you mean by that term?

A. A diet that will provide all of the other essential nutrients can be expected to furnish all of the Vitamin A that is required.

In fact, the most recent surveys that have been made indicate that the average in-take for the whole population of this country
2617 is 9,000 units a day; and it isn't difficult to get enough Vitamin A from foods that are readily available to us.

Q. Well, isn't it true that the recommended dietary allowances of the National Research Council with respect to vitamins which are set forth in Paragraph 4 of your affidavit are merely recommendations of what a normal, healthy individual would require to supply his body with an adequate quantity of those particular vitamins?

A. They do not. A normal healthy individual will not require as much of the vitamins as listed, with the possible exception of Vitamin D. That comes the closest to being the actual requirement of any of the vitamins listed here.

As I explained before the actual Vitamin C requirement is way below the recommended dietary allowance.

Q. You mean that these recommended dietary allowances are for people below average rather than normal?

A. No; they represent rather generous in-takes of vitamins.

Q. They are not therapeutic recommendations to meet deficiency diseases?

A. No.

Q. Or deficiencies in diets?

A. No.

2618 Q. So they are not really comparable, then, to the recommendations made for Nutrilite?

A. No, they are not.

Q. Doctor, do you know whether or not physicians ever prescribe 25,000 or more USP Units of Vitamin A in cases of deficiency of that vitamin?

Mr. GOODRICH: I object to that question on the ground it is entirely irrelevant and calls for a speculative answer, in addition.

THE WITNESS: There are products that are labeled in which such dosages are recommended; and I presume that doctors may use them, although there are very few cases of Vitamin A deficiency; and to what extent they may be used, I don't know.

Mr. RHYNE: The reason for my question was that I noticed a statement in the American Medical Association work entitled, "New and Non-Official Remedies," on Page 545, which makes the statement that:

"Doses of 25,000 are often prescribed in cases of deficiency."

Mr. KLEINFELD: I would like to have you ask the question, if you are asking one.

Mr. RHYNE: I have finished.

Mr. KLEINFELD: It is a question?

2619 Mr. RHYNE: Yes.

Mr. KLEINFELD: Will you read it?

(Whereupon the question was read by the reporter.)

Mr. RHYNE: I have not finished my question.

By Mr. Rhyne:

Q. You have seen such statements made, I take it from your previous answer, Doctor, in the literature, scientific literature of that character?

A. There have been recommendations of that kind to which the Council on Pharmacy and Chemistry has been definitely opposed: It can see no need for recommendations in excess of 25,000 units a day in cases of Vitamin A deficiency.

Q. Doctor, what is that Council; what is it composed of?

A. It is the Council that prepares the book to which you just referred, "New and Non-Official Remedies."

Q. Doctor, are you familiar with the "United States Dispensator"?

Mr. GOODRICH: I object on the ground that this witness is not a medical man.

THE WITNESS: Yes. I am not particularly familiar with it because I have no use for it in my work particularly. I know there is such a book.

Mr. RHYNE: If it is not required in your work, I won't
2620 ask you any question about it.

By Mr. Rhyne:

Q. Are you aware, Dr. Nelson, that 1,000 to 3,000 USP Units daily are recommended for infants and children in case of deficiencies in Vitamin D?

A. Yes, sir.

Q. Is it not true that in many cases where deficiencies of Vitamin A or Vitamin D exist, physicians recommend a greater in-take of those vitamins than the amounts recommended by the National Research Council?

A. That is true.

Q. Dr. Nelson, in Paragraph 6 of your affidavit, you state that Nutrilite contains 20 milligrams of Vitamin B-1. You further state that the generally accepted in-take of Vitamin B-1 is 5 to 10 milligrams daily; and you further state that the amount of Vitamin B-1 in Nutrilite is 13 times the recommended amount. I was wondering about your mathematics.

A. You didn't read all of the statement that refers to "generally accepted." "It is generally accepted that 5 to 10 milligrams of thiamin is sufficient as a therapeutic dose." And the therapeutic dose is considerably in excess of the daily requirement that is referred to in the previous sentence.

Q. I see. That qualifies the National Research Council
2621 reference?

A. Yes, sir.

Q. Again referring to this volume on "New and Non-Official Remedies" of the American Medical Association, which you have before you, I noted a statement on Page 549——

Mr. GOODRICH: Again I object to this line of inquiry on the same ground as stated previously.

By Mr. Rhyne:

Q. On Page 549 it states, with respect to B-1:

> "Evidence on which to base dosages in the treatment of acute deficiencies is meager. There are indications that doses to the order of 10 to 50 milligrams may be advantageous in specific instances."

Do you agree with that statement?

Mr. KLEINFELD: I object to that on the ground it is irrelevant.

THE WITNESS: Yes; there may be cases in which a patient is near the point of death because of a heart condition that has developed Vitamin B-1 deficiency where dosages of that size, 10 to 50 milligrams, may be useful; but there is very little evidence to indicate that a dose in excess of 10 milligrams a day will do anything more than a dose of 10 milligrams a day.

2622 By Mr. Rhyne:

Q. In connection with your latest statement, Doctor, I have another note here from this "United States Dispensator," Page 1211, where it states, and I quote:

"For mild deficiency, 10 milligrams may suffice, but in severe deficiencies, 2 to 4 times of this dose may be required."

I take it you agree with that statement?

A. Yes, essentially.

Q. In Paragraph 7 of your affidavit, you state that Nutrilite contains riboflavin, Vitamin B-2, five times in excess of the National Research Council figures.

Are you aware of the statement which the "United States Dispensator" makes with reference to the daily dose of this vitamin?

A. I am not.

Q. I can tell you that on Page 986 it says:

"Two to 15 milligrams is the daily dose."

Would you agree or disagree with that?

Mr. GOODRICH: I object to that on the ground that the witness has stated he is not familiar with the "Dispensator"; he doesn't use it in his work; and for that reason, the question is improper.

THE WITNESS: I have no basis for disagreement.

2623 By Mr. Rhyne:

Q. Doctor, in this volume that you have right before you now, this "New and Non-Official Remedies," directing your attention to Page 559, don't you find that it recommends about twice as much Vitamin C, that is, 100 to 150 milligrams daily, as that recommended by the National Research Council?

A. This is recommended by the Council on Pharmacy and Chemistry of the American Medical Association.

Q. Yes.

A. Yes, they recommend 100 or 150 milligrams.

Q. So that is, roughly, about twice what the National Research Council figures are contained in your affidavit?

A. It does go as high as twice, yes.

Q. Doctor, referring to Paragraph 9 of your affidavit, where you say:

"The need for Vitamin B-6, pantothenic acid, Vitamin E, Vitamin K, inositol and para-amino-benzoic acid in human nutrition has not been established."

By that statement, do you mean that those vitamins and food factors are of no value in human nutrition?

A. Vitamin K is known to be of value in human nutrition, and in some cases provision must be made for taking it orally. But
2624 it appears that most of the Vitamin K needs of the body are obtained through synthesis of the vitamin by micro-organisms in the intestinal tract.

Q. What about Vitamin E?

A. There is no established need for Vitamin E in human nutrition.

Q. There is some dispute in the scientific writings on that; is there not?

A. There is dispute.

Q. Is the same true of pantothenic acid?

A. I am not familiar with any evidence that pantothenic acid plays a role in human nutrition. The only dispute that has arisen with respect to pantothenic acid which has come to my attention is the claim at one time by a group of investigators that pantothenic acid was of value in restoring the color of gray hair. That claim has been disproven by very careful and extensive studies.

Q. What about Vitamin B-6?

A. There is no evidence as yet, that is, direct evidence that any deficiency in man responds to treatment with Vitamin B-6. There are certain conditions where it is claimed that beneficial results are obtained, such as in sickness that occurs with X-ray treatment.

A number of investigators have indicated that they
2625 believe Vitamin B-6 is of value in relieving that condition.

But as far as any deficiency disease in man, I don't believe there is any evidence that there is such a disease that will respond to treatment with Vitamin B-6.

Q. Well, isn't there some conflict in the medical journals and scientific writings on that very point?

A. No, no. There has been no report of any disease in man that has responded to treatment with Vitamin B-6.

Q. As a deficiency disease?

A. A deficiency disease; that is right.

Q. How about inositol?

A. There is no evidence whatever with respect to its need in human nutrition. There is very little evidence with respect to its need in animals.

The in-take of inositol in ordinary diets is fairly high. The average in-take is of the order of a gram a day; as compared to 20 milligrams of inositol in the daily recommended in-take of Nutrilite; and that is only 1/50 of what the average daily in-take is.

Q. What of para-amino-benzoic acid? What about that?

A. There is no evidence that that substance plays any role in human nutrition. It is of value in the treatment of certain
2626 diseases called rachitial diseases when taken in very large amounts, but that has no relation to what is needed for normal nutrition.

Q. Of course, I note that the label of Nutrilite states that "The need for Vitamin B-6, pantothenic acid, inositol and para-amino-benzoic acid in human nutrition has not been established." So that label would conform to what you have just stated?

A. Yes. That statement is required in regulations under the Food, Drug and Cosmetic Act.

Q. Now, Dr. Nelson, I do have a note here that in 1939, on Page 2414, Volume 112, of the Journal of the American Medical Association, it was reported that:

> "Vitamin B-6 was beneficial to a group of patients suffering from extreme nervousness, insomnia, abdominal pain, weakness, difficulty in walking, irritability."

Have you heard or seen that writing or similar writings in any of the scientific journals?

A. What was the date of that publication?

Q. 1939.

A. I do not recall that particular publication at the moment, but there have been several recent reviews published with respect to the role of Vitamin B-6 in human nutrition; and they are all in
2627 agreement to the effect that there is as yet no evidence that Vitamin B-6 is needed in human nutrition, so far as observations on man are concerned.

Q. Do you know approximately when the Vitamin B-6 was isolated and chemically identified?

A. Well, it was about 1939 or 1940. I don't recall the year at the moment. I recall that an award was made to the men who made that discovery by the American Institute of Nutrition; and I think it was about 1939.

Q. Have you read in the medical journals about any investigations that indicate that Vitamin B-6 might be of value in controlling certain types of paralysis?

A. Yes, I have. There were reports of that kind, and that subject was studied carefully by medical men in the Food and Drug Administration. Subsequent study showed that the observations that had been reported that Vitamin B-6 was of value in the treatment

of paralysis agitans and similar nervous disorders were not well founded. They were disproven.

Q. Was the same true with respect to acne?

A. I didn't know that any claim had ever been made for its value in the treatment of acne. Practically everything else has been proposed for that.

Q. You have never heard of that?

A. No.

2628 Q. Dr. Nelson, are you familiar with a volume entitled, "Diatherapy," by M. G. Wohl, M. D.?

A. No, sir.

Q. If you have not seen that, I will not ask a question about it. Doctor, isn't it true that clinical tests have disclosed that a deficiency in Vitamin E is sometimes related to habitual abortion, muscular dystrophy, primary fibrosis?

Mr. KLEINFELD: I object to that, Mr. Rhyne. I think you are asking medical questions now—not diseases.

Mr. RHYNE: From his testimony to date, it seems while Dr. Nelson has been head of this Division for many years, that he acquires a lot of his knowledge from medical journals and scientific writings; so I am just asking him if, in acquiring that knowledge, he has read that Vitamin E is useful under those conditions or for those conditions?

THE WITNESS: Yes, I have read such a paper.

By Mr. Rhyne:

Q. I am trying to shorten this rather than read a lot. Have you also, from the same sources, read that a deficiency in Vitamin K results in defective coagulation of the blood?

A. I am not familiar with any evidence that such condition is due to an inadequate in-take of Vitamin K. The prolongation of

2629 the coagulation of the blood may be due to an insufficient amount of Vitamin K being absorbed if there is obstruction of the bile, because the fat soluble vitamins such as Vitamin K are not absorbed if there is bile obstruction. In such cases you may have prolonged clotting time of the blood.

In certain instances, too, the injection of mineral oil apparently either interferes with the production of Vitamin K in the intestinal tract or removes all the Vitamin K that comes into the intestinal tract, so that it is not absorbed; and in those cases, you get prolongation of the blood clotting time. But I know of no cases that have been reported where it has been shown that there has been an actual prolongation of the blood clotting time due to an inadequate in-take of Vitamin K without any disorder or abnormal condition.

Q. Doctor, have you heard that Vitamin K is found chiefly in alfalfa?

A. I wouldn't say it is found chiefly in alfalfa. It is found in all green, leafy material, and vegetable oils are fairly rich in Vitamin K.

Q. You do know that it is found in alfalfa; do you not?

A. It is found in alfalfa, yes.

Q. Now, with reference to para-amino-benzoic acid, haven't you learned from the scientific journals and from your
2630 own experience that it has proved valuable in the treatment of skin and hair disorders?

A. Treatment of skin——

Q. And hair disorders?

A. No.

Q. Have you heard it?

A. No.

Q. What about with sterile conditions in women. Have you read of studies that proved that it was beneficial in those instances?

A. No, sir.

Q. Referring again to the cost factor which is emphasized in your affidavit, isn't it true that the vitamins and minerals that are not listed in your cost chart represent a substantial cost of the product?

A. The cost of the minerals would be very small indeed. It would not modify the figure much. The cost of the other vitamins would not be a particularly big item. Vitamin K would probably be the greatest. But pantothenic acid and inositol and para-amino-benzoic acid are present in such small amounts that the actual cost of the material would be very low indeed. Next to Vitamin K would be the cost of Vitamin E.

2631 Q. Doctor, hasn't it been your conclusion that the need of vitamins and minerals in the human diet has been clearly established?

A. Yes, the need for certain vitamins and minerals has been clearly established.

Q. And isn't it also true that much progress is constantly being made in the direction of determining the actual value of vitamins and minerals in the human diet and that the entire field of vitaminology is relatively new?

A. You have more than one question there; but it is true that a great deal of progress is now being made in learning how the vitamins function. They have really relatively little knowledge of how the vitamins actually function in the body. We know that certain changes take place in deficiency of vitamins, and that you can correct those conditions by taking vitamins, but the actual physiological changes that take place in the body are not understood at the present time or understood very little.

Now, so far as the field of vitaminology being new, the name "vitamin" was coined in 1911, and we have dealt with vitamins

since that time. It would be new in terms of geology, certainly, but whether it is new in the field of biochemistry, I wouldn't be so certain. It isn't particularly new.

2632 Q. Doctor, going back to this cost factor again, isn't it true that in addition to the six items that Nutrilite contains that are not listed in your affidavit, you have not made any evaluation of this base of alfalfa, water cress and parsley that Nutrilite contains, and its value in human nutrition, in making this comparison?

A. Well, so far as the vitamins and minerals are contained in those products, they are all taken care of in the quantities of those listed on the labeling.

Q. Yes.

A. Whatever vitamins or minerals they provide.

Q. It is the base that I am referring to of parsley, water cress and alfalfa that add something in addition to the vitamins.

A. Well, what they may actually cost, I have no knowledge of that.

Q. Have you made any laboratory test or any evaluation of the value of that base?

A No, sir.

Q. Do you think there is anything harmful in taking amounts in excess of the amounts recommended by this National Research Council?

A. Yes, if you place no limit on the amount that you

2633 might take.

Q. Say the amounts recommended by Nutrilite?

A. No, I have no information that would indicate that taking those quantities would produce injury.

Q. Doctor, does your experience indicate that vitamins and minerals such as those found in Nutrilite are helpful in the case of low vitality of a person where they are absent in his diet? If he receives those through the taking of Nutrilite, couldn't that have some effect on his low vitality?

A. If a person was actually suffering from a deficiency of any of the essential vitamins or minerals, undoubtedly, a condition may develop in which an individual would have a lack of vigor. He would be sick, in other words.

Q. And in those instances, the vitamins and minerals contained in Nutrilite would be helpful?

A. Yes.

Q. Now, when you rendered this opinion to the American Medical Association, did you call that to the attention of the manufacturers or distributors of Nutrilite in any way?

A. No, sir

Q. Isn't it true, Doctor, that new vitamins are being identified every few years?

A. That has been true during the last two decades.

2634 There have been several vitamins that have been identified.

Q. Is it possible that this base of alfalfa, parsley and water cress, which Nutrilite has and which is not contained in the other two products which you list in your affidavit, could mean that Nutrilite is more valuable in human nutrition than those other two products?

Mr. KLEINFELD: I object to that question on the ground that it is irrelevant and calling for a conclusion of the witness.

THE WITNESS: I don't know. It may be a possibility.

By Mr. Rhyne:

Q. You just haven't tested Nutrilite to discover what value this base might contain?

A. No, sir.

Mr. RHYNE: Doctor, I believe those are all the questions that I have to ask you now. I understand that you will return from Europe about the 7th of May and that, if necessary, we can ask you a few more questions, either before the trial or during the trial, at some convenient time that counsel can agree upon and that is agreeable to you.

THE WITNESS: Yes, my present plans are to be away for at least three weeks; and I expect to be back in this country by May

2635 7. There may be changes in those plans, however; but those are my present plans.

Mr. RHYNE: With that understanding, those are all the questions I have to ask now. I thank you very much, Dr. Nelson.

Mr. GOODRICH: I have a few questions.

Examination by Mr. Goodrich:

Q. Doctor, does the Food and Drug Administration have another division which passes upon the therapeutic value of drug preparations?

A. It has.

Q. What is that division?

A. Medical Division.

Q. In so far as you have stated opinions, are those opinions based upon your guess or upon your training and experience as a nutritionist?

A. They are based upon all of my knowledge and experience, what I have read, what I have obtained, what information I have obtained from various people in the field whom I have consulted.

I have plenty of opportunity to consult leaders in the field of nutrition.

Q. State briefly your educational and professional experience for the record?

Mr. Rhyne: I will concede that he is qualified.

2636 Mr. Goodrich: I would like for it to be stated in the record to show exactly what his field of specialty is.

The Witness: I graduated from the University of Wisconsin in 1918, and majored in agricultural chemistry. That is a department that is now called the Department of Biochemistry. I received my Master's degree in 1919 from that same institution, and a Doctor of Philosophy degree in 1923.

From 1920 to 1925 I was on the staff of the Department of Agricultural Chemistry at the University of Wisconsin. I was engaged in research on problems that related to vitamins.

From July 1925 to April 1926, I held the position of Director of Chemistry and Nutrition with the Soft Wheat Millers Association, with headquarters at Nashville, Tennessee.

Since April 1926, I have been with the organization that has been responsible for the enforcement of the Food and Drugs Act of 1906, and subsequently, the Food, Drug and Cosmetic Act, which replaced it in 1938.

For a period from 1926 until 1935, half of my time was spent in dealing with problems relating to the enforcement of the Food, Drug and Cosmetic Act, and the other half of my time in studying problems directly related to nutrition and vitamins particularly. Many of these studies dealt with the effect of commercial processes on the stability of vitamins.

2637 Since 1935, I have been Chief of the Division of Vitamins in the Food and Drug Administration.

I am a member of the American Institute of Nutrition, an organization whose members are all qualified to conduct research in the field of nutrition. I am president of that Institute the current year. I have served two terms of four years each on the Board of Editors of the "Journal of Nutrition," which is the official publication of the American Institute of Nutrition.

I am a member of the American Society of Biological Chemists. That organization is similar to the American Institute of Nutrition in its requirements for membership.

I am a member of the Food and Nutrition Board of the National Research Council; have been since January 1941, which was a few months after the organization was created.

I am a member of the Vitamin Advisory Board of the United States Pharmacopoeia. I am a member of the Council on Pharmacy and Chemistry of the American Medical Association, and have been since about 1935.

In 1934, I was a delegate from this country to the International Conference on Vitamins that was held in London, to consider standards for vitamins. This conference was sponsored by the Health Organization of the League of Nations.

2638 By Mr. Goodrich:

Q. I think that is enough to indicate your qualifications. Do you regard the book that has been shown you, "The Modern Home Physician," as an authoritative medical treatise?

A. I have never read the book.

Mr. RHYNE: It is called "Modern Home Medical Adviser," by Morris Fishbein, M. D.

By Mr. Goodrich:

Q. Would you regard it as an authoritative work in the field of nutrition?

A. From what I have seen of the table, I would not so regard it.

Q. I ask you to look at the column on Pages 504 and 505, the photostat of which has been marked Exhibit B, the column headed, "Deficiency Leads To," and to state whether, in your opinion, the symptoms there listed occur more frequently in conditions other than vitamin deficiencies than in Vitamin deficiency diseases?

A. Most of the conditions that are listed in that column are more frequently due to causes other than vitamin deficiency. Under Vitamin A, it is quite probable that night blindness may occur more frequently due to Vitamin A deficiency than to other
2639 causes; but the other conditions listed are more likely to be due to other causes than to vitamin A deficiency.

Q. Do you regard a layman as competent to diagnose a clinical case of deficiency diseases that would require a therapeutic dose of vitamin preparation?

A. Oh, he certainly would not be qualified to diagnose such diseases.

Q. What is the approximate caloric value of the water cress, alfalfa and parsley contained in three capsules of Nutrilite, which I understand is the daily recommended dose?

Mr. RHYNE: Two.

By Mr. Goodrich:

Q. Two capsules; I will amend it to two capsules.

A. From the appearance of the capsule and the weight of it, which I judge by holding it in my hand, two capsules would not contain more than possibly a gram or two, and caloric value could

not possibly be more than 5 or 10 grams at the most. A very small fraction of the total caloric requirements.

Q. What is the average daily caloric in-take in the American dietary?

A. It is of the order of 3,000 calories per day.

Q. What proportion of that would be contributed by two capsules of Nutrilite per day?

A. A very small fraction of one per cent.

2640 Q. Is there any other known nutritional element of water cress, alfalfa and parsley than the vitamin and mineral elements that have been discussed?

A. The plants, themselves, would contain other constituents that would have some nutritive value. All plant material of that kind would contain some protein and some carbohydrate, possibly a very small amount of fat, but the quantities of those would be insignificant in the small quantity of those materials.

Mr. GOODRICH: I have no further questions.

Further examination by Mr. Rhyne:

Q. Doctor, with reference to your last question, of course, this is in concentrated form; so you have no real way to evaluate it in that concentrated form; do you?

A. If we assume that all the material inside of this capsule were a mixture of protein, carbohydrate and fat, the quantity would still be very small in terms of the total daily requirements of those nutrients.

Q. Mr. Goodrich asked you a question, directing your attention again to Page 504 of this volume entitled, "Modern Home Medical Adviser," about Vitamin A; and you stated that Vitamin A is of value possibly for night blindness. Does it have any value for

2641 any other deficiency disease; and if so, could you name some of those diseases?

A. Well, there is no specific name given to the disease which results from Vitamin A deficiency. The disease manifests itself in various ways. Night blindness is one of the earliest symptoms of Vitamin A deficiency; but as the disease progresses, you get inflammation of the lids and infection of the eye; and there will be a loss of the eye entirely if no remedial measures are taken.

Changes also take place in the mucous membranes, the membranes that line the respiratory tract, alimentary tract, the urogenital tract, and produce certain changes, so that infections are more likely to take place in those areas; and when the disease is advanced, you may have other infections take place.

Q. Well, in layman's language, Doctor, does that mean that Vitamin A can help prevent certain diseases, infections, for example?

A. No.

Q. What is it good for, then, in layman's language? What is Vitamin A good for? What conditions can it help or prevent?

A. Rather specific conditions that occur with a deficiency.
2642 The eye condition is the one that is most generally noticed; but when that stage is reached, an individual is in a very poor state of health.

Just how the vitamin functions, we don't know. The indication is that it functions, in part, in the mechanism that is concerned with seeing, but it undoubtedly serves other purposes in the body; but just how it functions is not known. You might say that an individual just goes to pieces in various respects when he doesn't get enough of the vitamin; and the same is true with respect to other diseases that occur with vitamin deficiencies.

Q. Can you give me anything in layman's language that Vitamin B is good for?

A. It is good for the disease beri-beri, and the various manifestations of that disease.

Q. Is it good for anything else?

A. No.

Q. What about Vitamin C? What is it good for?.

A. It will prevent or cure the condition known as scurvy in man. When Vitamin C is deficient in the diet, certain changes take place in the blood vessels of the body, particularly the small ones, so that they are broken more easily and you have hemorrhages underneath the skin. There is also severe pain in the joints and frequently in the teeth and gums.

2643 Q. Is that like arthritis, or is that something different?

A. Arthritis is something quite different from scurvy, but the severe pains are difficult to differentiate from arthritis. It is not only the joints that are sore. An infant that is suffering with scurvy will cry with any movement of the body, or with just a slight touch.

When the disease becomes advanced in the adult, particularly, there is hemorrhage in the mouth around the gums and the teeth, and infections may follow that condition.

But just how the Vitamin C functions to prevent these conditions, or to cure them, has not been revealed through scientific studies.

Q. What about Vitamin D? What is it good for, in layman's language?

A. Vitamin D is important in controlling or aiding in the assimilation of calcium and phosphorous from the intestinal tract. The

disease that occurs from Vitamin D deficiency in infants is called rickets. It leads to improper mineralization of the bones, so they become soft and bend when any weight is put on them, like the legs, so that you have conditions developing which are described as bowed legs or knock-knees. You may have deformities of the chest
2644 and of the backbone, all indicating a certain softness of the bones, so that they become misshapen.

When you get beyond the age of deficiency, you are not likely to have deformities of the bones, but there will be a lack of deposit of the minerals in the bone, and in elderly persons, the condition is developed which the physicians refer to as osteoporosis, meaning that the bone is not properly formed.

Q. This vitamin can help that condition?

A. Vitamin D can prevent or cure that condition, providing sufficient calcium and phosphorous are available in the diet for the formation of the bone.

Q. What about Vitamin E?

A. I do not recognize any function of Vitamin E in the human body. It has been shown in animals, particularly in the rat, that in the absence of Vitamin E, you do not have reproduction. The female will conceive, but the foetus will not grow to maturity and be born. There will be death of the foetus before it reaches maturity. That condition can be very well demonstrated with a rat.

In certain other animals, there is a degeneration of certain muscles and indication of some effect on the nervous system,
2645 and a condition similar to what is called muscular distrophy in children can be produced.

In a growing chick, a rather different picture presents itself in that the changes are primarily in the brain tissue that are observed first.

Q. So far as human nutrition is concerned, nothing definite has been established?

A. Nothing definite has been established.

Q. Then Vitamin K, what is it good for, in layman's language?

A. Well, as I said before, I am unfamiliar with any case on record where a deficiency in the in-take of Vitamin K in man has brought about an abnormal condition; but under certain conditions, Vitamin K may not be absorbed properly from the intestinal tract. When that takes place, you have a prolonged blood clotting time, and in animals it can easily be demonstrated—in chicks particularly—that the animal will bleed to death from very slight injury.

The same condition does not develop in the rat, because in the rat the vitamin apparently is synthesized in the intestinal tract, and it is difficult to produce any Vitamin K deficiency in the rat.

All of the indications are that most of the Vitamin K that
2646 is needed by man is produced in the intestinal tract by bacteria, micro-organisms which grow there, and the Vitamin K which is produced can be utilized by the body.

Q. I notice in going over this I missed Vitamin B-*w*. Is it good for anything in particular, in layman's language?

A. Not in anything that I can put in layman's language. The disease that results from Vitamin B-2 deficiency is called riboflavinosis, the term meaning lack of riboflavin, which is the chemical name of Vitamin B-2.

When there is a deficiency of Vitamin B-2 in man, there are certain changes that take place in the mucous membranes of the mouth, and the tongue will assume a red or magenta color, which is very characteristic. There are usually angular sores at the corners of the mouth, and eruptions of the skin around the nose and possibly on the forehead.

There are also changes that take place in the eye. Capillaries invade the cornea or the white portion of the eye, so that they have a reddish appearance.

If you have a combination of those conditions that I have described, it is probably a pretty accurate indication that the individual is suffering from riboflavin deficiency; the tongue being the most specific symptom that shows up, but the other conditions are not necessarily specific.

Q. Does it have anything to do with nervousness?

2647 A. No.

Mr. RHYNE: That is all.

Mr. KLEINFELD: I would like to ask a few questions.

Examination by Mr. Kleinfeld

Q. Dr. Nelson, from your experience with vitamins and their effect on human beings, in your opinion, would any vitamin or any collection of vitamins, such as that contained in Nutrilite, have any beneficial effect in cancer—vitamins or minerals contained in Nutrilite?

A. No, not from any information that is available at present.

Q. I would like to ask you the same question with respect to heart diseases?

A. With respect to heart disease, it would be true only with respect to Vitamin B-1. There is a very definite change that takes place in the heart with Vitamin B-1 deficiency; and if the condition has not progressed too far, it is reversible and can be properly treated with Vitamin B-1.

Q. How about tuberculosis?

A. There is nothing in such a product that would be of any specific value in the treatment of tuberculosis.

Mr. KLEINFELD: Mr. Goodrich, do you have anything?

2648 Mr. GOODRICH: Is it a fair statement, then, on the basis of what you have said, that if a person buys a product such as Nutrilite on the basis of labeling which recites symptoms comparable in kind to those set forth in Exhibit B, that he would more likely be buying a product which he did not need than a product which he did need?

THE WITNESS: I think that is a fair statement.

Mr. GOODRICH: And why is that so, Doctor?

Mr. RHYNE: When you say Exhibit B, you mean this Exhibit B that is before him here?

Mr. GOODRICH: Yes.

THE WITNESS: Because if he depended upon those symptoms to guide himself, he would be more likely to be suffering from some disease that was not due to a vitamin deficiency than he would be suffering from actual vitamin deficiency.

Mr. GOODRICH: That is all.

Further examination by Mr. Rhyne

Q. Well, Doctor, if he were suffering from a vitamin deficiency, I believe you have already testified that the contents of Nutrilite, its minerals and vitamins, would be of assistance in connection with the various specific things you have mentioned, and the general things you have mentioned?

A. That is true.

2649 Q. Now, you were asked about tuberculosis. Wouldn't Nutrilite help build up resistance to a disease like tuberculosis?

A. No, sir.

Q. You mean no vitamin——

A. Well, you are getting into a field that is rather broad, and it is not within my particular field of competence.

Q. I noticed you said it had no specific value.

A. One of the most important things in tuberculosis is diet, that, together with rest. Now, it depends on how the tubercular individual may be taken care of. If his diet is adequate, something of this kind wouldn't help him. But if his diet wasn't adequate, there might be some advantage accrue to him from taking such a product.

Q. Well, along the same line, how about diabetes? There a diet also is important, is it not, and would not the vitamins and minerals contained in Nutrilite help a person with diabetes?

A. No, sir; would be of no value whatsoever.

Q. Not even in building up his diet, if it is deficient?

A. That would have no bearing on the disease diabetes, itself.

Q. But just as in the case of tuberculosis, it could cer-

tainly help build up his strength and resistance to factors
2650 which would otherwise weaken him because of deficient diet; isn't that right?

A. No, sir. An individual suffering from diabetes is suffering from one specific cause of his disease, and that isn't influenced one way or the other. He has to take insulin or reduce the amount of sugars that he has in his diet, and the quantities of vitamins or minerals he would take would have no bearing on the amount of insulin that he would have to take in order to keep going.

Q. In the case of tuberculosis, certainly the quantity of vitamins and minerals that he would take would have some relation to the other diet he would be required to take; isn't that true?

A. Well, it is most important that he receive an adequate diet and Nutrilite would not have any specific effect on the disease in itself. It is only if an individual should be taking a diet that is not adequate with respect to the vitamins or minerals contained in the product that he would benefit; and that would be equally true of a person who didn't have tuberculosis.

Mr. RHYNE: That is all.

Mr. GOODRICH: No further questions.

2651 Mr. RHYNE: Thank you very much, Dr. Nelson. You have been very patient.

(Whereupon at 4:35 p.m., the deposition was continued to a time hereafter to be fixed.)

OFFICE OF THE ADMINISTRATOR

CERTIFICATE

Pursuant to the provisions of Section 1601, Chapter 10, Title 42, United States Code (55 Stat. 184), I hereby certify that the attached

Three copies of Finding of Fact to support multiple seizures of the drug "Nutrilite Food Supplement", signed by Robert C. Butz, M.D., Medical Officer, Food and Drug Administration, dated September 30, 1948, December 2, 1948 and December 9, 1948 and the Conclusion signed by J. Donald Kingsley, Acting Administrator, [illegible] dated January 28, 1949,

are true copies of official documents on file in the Food and Drug Administration of the Federal Security Agency and are part of the official records of said Administration and Agency.

In witness whereof, I have hereunto set my hand, and caused the seal of the Federal Security Agency to be affixed on the day and year first above written.

By direction of the Federal Security Administrator.

L. W. A'Hearn

Nutrilite Food Supplement

FINDING OF FACT

It is the consensus of informed medical opinion that a product consisting of extracts of alfalfa, parsley, and water cress fortified with crystalline vitamins and vitamin concentrates which provides in the daily intake the following:

Vitamin A, 25,000 U.S.P. units.
Vitamin B_1, 20 milligrams.
Vitamin B_2, 10 milligrams.
Vitamin C, 200 milligrams.
Vitamin D, 2500 U.S.P. units.
Vitamin E, 10 milligrams.
Vitamin K, 0.4 milligram.
Vitamin B_6, 4 milligrams.
Inositol, 20 milligrams.
Para-aminobenzoic acid, 20 milligrams;

together with a product consisting of bone meal, dicalcium phosphate, iron ammonium citrate, potassium iodide, niacin amide, and pantothenic acid which provides in the suggested daily intake the following:

Calcium, 950 milligrams.
Phosphorus, 562 milligrams.
Iron, 10 milligrams.
Iodine, 0.4 milligram.
Niacin amide, 15 milligrams.
Pantothenic acid, 8 milligrams;

would not be effective in the treatment of low vitality, over-fatigue, insomnia, poor appetite, gastro-intestinal distress, recurrent vague aches and pains, weak eyes, defective teeth, nervousness, heart disease, stomach pains, disease conditions requiring surgery, feeble mindedness, diabetes, hemorrhage connected with the menopause, indigestion, sneezing, weeping, anemia, leukemia, sinus trouble, con-

stipation, tuberculosis, headache, dizziness, vomiting, and all deficiency diseases.

2682 EXHIBIT "A"

(Quoted from booklet entitled "How to Get Well and Stay Well")

How to get well and stay well.

If your health problem is the result of dietary deficiencies, and if you want to get well and stay well, be sure to read this book. Even if you are sure your diet has nothing to do with your ailment, read this book now, because science is connecting more and more physical troubles with diet and nutrition. If your health is good read this book and learn how to stay well.

Published by Mytinger & Casselberry, Inc. Wholesale Distributors Nutrilite Products * * *

* * * What we have tried to do in this book is show the average American, ill with the usual American deficiency ailments in the

customary chronic manner, what may be the cause of his illness, and how he should proceed to get well and stay well.

* * *

Please remember, then, that this book is designed to bring you some little-known or not-often-thought-of facts about your health and the health of your family. * * *

Are you a victim?

Are you suffering from hidden hunger?

Are you slowly starving to death?

* * * Just look around you at the members of your family, at your neighbors, friends and relatives—at yourself. Can you find even three or four who are absolutely and completely well? Are *you* enjoying perfect health?

On the other hand, think of your friends and relatives, one after the other, and note how many are weak and lacking in energy, having trouble digesting their food or suffering with actual stomach pains, with decaying teeth, trouble with their hearts and other important organs, and with aches, pains and discomfort in various parts of their bodies. Think of your friends and relatives and note how many, in the last six months, have been to doctors or hospitals for treatment. Think of those who *should* be having physical help of some kind, but who are not receiving it. And finally think of people you know, your age and younger, who have *died* in the last year, prematurely.

* * *

* * * The healthy individual *feels* good. He has a constant awareness of his body functioning properly and feeling good. He enjoys getting hungry, he relishes his food, and he enjoys the feeling of well-being which comes with his healthy digestion. He enjoys exercise, likes to get tired occasionally, and appreciates a rest. He never complains of his physical condition, since it is always good.

* * * The healthy person * * * is calm and relaxed, with his abundant energy under control. His thinking is clear, and this, coupled with his energy, and full use of his faculties * * *

Now—what do you think? How many of the people in your family meet these health requirements? How many of your friends measure up to these standards? Do *you?* Don't you think the facts point to the need for *something?*

2683 What good health means to your body.

Having seen what good health means to *you*, let's see what good health means to *your body*.

All your senses—sight, taste, touch, hearing, and sense of smell operate *in* your body, and they depend, consequently, on your physical condition for their correct operation. If your sense organs, and your brain and nervous system have been supplied constantly with all essential materials for their growth, maintenance and operation,

and your body chemistry is normal, then, barring accidents, you will be in full possession of your faculties. If your sense organs have been partly starved, you will have difficulty seeing, hearing, or functioning in other ways.

Your brain is one of your most important organs, and it operates in close association with the spinal chord, for the control of muscle movements. When the cells of the brain and nervous system are properly nourished, and the body chemistry is correct, the thought and behavior processes proceed normally. Damage to the brain or nervous system, whether due to accident or to breakdown due to insufficient supply of building material for the cells, usually results in at least a partial inability to move the various parts of the body, (stroke or paralysis) and at least a partial breakdown of the thought processes (confused thinking).

* * * When your heart functions normally and beats regularly and strongly you go along like a $10,000 car running down hill. But when you fail to supply your heart with the necessary materials to keep it constantly rebuilt, and when your body chemistry is bad, your heart breaks down, and you acquire one of the various forms of heart trouble due to dietary deficiencies.

* * * when the body chemistry is bad, or the glands themselves begin to waste away due to failure to keep them supplied with the necessary building material, our personalities do undergo enormous changes, and the whole operation of the body becomes a burden.

* * * Perfect teeth are possible, and decaying teeth are sure signs of a body which is falling apart.

Now it might be interesting to study your family, your relatives, friends and yourself along these lines too, and see how you all check up. Do any of you have difficulty seeing, hearing, or failure of other sense organs? Does anyone have to be careful not to overexert? Any with extreme personality changes? Any with false teeth? Any other evidence of failure of the various organs and glands of the body? Any illness, breakdown, or invalidism? Any weakness or incapacity?

Nobody *wants* to be ill. Nobody chooses to have a body racked with aches and pains. But the fact remains that various deficiency ailments sneak up on us, and unless we take proper precautions now, eventually we may find ourselves bound, and in the power of some deficiency disease, if it has not occurred already.

* * *

Did you know that twenty-two million children in the United States need corrective treatment, ten million of them have bad teeth, six million are suffering from glandular disturbances, four million are improperly nourished in other ways, one million have tuberculosis and one million have spinal curvature—and even the curvatures may originate in deficiencies in protective food values?

Unhealthy, sickly, malnourished children are a thorn in the flesh. Being sickly, they are petulant or sullen. Being malnourished, their nervous systems do not operate correctly, and they learn
2684 with greater difficulty, both in school and at home. In addition there is the bother, trouble and expense occasioned by the constant treatment required, if the child has some definite ailment. And finally, there is the blight put upon the child's whole future, when he gets a wrong start at home.

* * *

* * * if you don't want sickly children, you must see that they are properly nourished, and if you want healthy adults you must see that they are well nourished as children.

Some obvious conclusions.

This little study of the children of America shows that millions of children all over the country, are ill.

Your study of yourself, the members of your family, your relatives and friends has shown you that almost *everyone* is more or less ill.

When you become ill, it costs money and time and trouble to get well again. It robs you of working time. And *it hurts!*

Obviously it is better to *keep* your body in splendid condition. But if your body has already begun to break down, as is the case with most of us, and which you recognize through your aches, pains, inconveniences and doctors' diagnoses, you can still do much toward returning it to it's basic and natural condition of health.

But before we tell you exactly how to do this—let us tell you a story. . . .

* * *

Carl Rehnborg * * *

* * * went into the slums of the great city, where poverty, ignorance, filth and disease had created an appalling death rate among the new-born, and opened a tiny nursery. * * *

* * *

* * * he was convinced that the vitamins, the various minerals, and certain other essential diet factors * * * were present in many raw foods. * * *

* * *

So, with continued feeble health or early death facing his infant patients, Mr. Rehnborg went out and gathered quantities of green grass, alfalfa, and other fresh green plants—scrubbed them thoroughly to rid them of all foreign matter; then carefully dried and ground them to a powder. Mixed into a thin gruel, he fed this powder to the babies, along with their milk.

* * *

* * he grew his own green plants * * *

And when his plants were harvested, processed, and added to the

diet of the babies in his clinic, not one failed to respond as expected!

* * * he had developed a practical formula for more perfect chemical balance for the body, which would help restore normal organic function, increase resistance to infection, and contribute to the upbuilding of the body so that it could throw off symptoms of disease and maintain complete health.

* * * he still further perfected this food supplem... by his own elaborate and ingenious extraction processes, discarding the non-essential cellulose and other parts of the plants, so that much value could be concentrated in small volume * * *

* * *

2685 When Mr. Rehnborn returned to the United States * * * he began a * * * period of intensive study and experimentation, to improve his food supplement. At last, * * * when he considered his formula sufficiently developed to warrant making his food supplement available to the public, he started to manufacture it. * * * This all led to further development and improvement and the creation of the present amazing food supplement * * *

* * *

* * * almost all members of our families have bodies which are malnourished, and show evidences of the malnutrition which causes most of our common deficiency ailments.

* * *

So the purpose of this book—and the objective of the person who lent you this book—is to bring you to the point where you will recognize the fact clearly that your illness and the illness of your family is, in almost every case, the result of a failure to supply your body and the bodies of the members of your family with the vital food factors. You must realize that if you wish to preserve your health and the health of your wife or husband, have healthy, happy children, fight off the common deficiency diseases yourself, and enjoy vibrant health and an active old age, you must put into your body all the food factors required by it.

This book tells you how to do this, and it supplies the answer to the enigma of modern medicine—why some people get sick so easily, and get well with such difficulty.

* * *

* * * give a little thought to what you put into the bodies of your wife or husband—into the bodies of your children—into your *own* body?

And remember your reward—a good chance for the relief of deficiency ailments if you have any (and most of our current and common ailments result from deficiencies) and their prevention if you are now lucky enough to be free from them. * * * Remember this . . . the American diet is deficient in protective food factors.

* * *

1945

Decreases in the crude death rates for the major infectious diseases—tuberculosis; pneumonia and influenza—occurred during both 1946 and 1947. The rate for tuberculosis declined from 40.1 in 1945 to 33.5 in 1947, a total decrease of 16 percent for this period; and the rate for pneumonia and influenza declined 17 percent, from 51.8 to 43.1. The crude death rates for these causes in 1947 were the lowest ever reported for the United States.

TABLE B.—DEATH RATES FOR THE 10 LEADING CAUSES: UNITED STATES, 1945-47

(Exclusive of stillbirths and of deaths among armed forces overseas. Rates per 100,000 estimated mid-year population excluding armed forces overseas)

CAUSE OF DEATH	1947	1946	1945
ALL CAUSES	1,007.8	997.6	1,061.8
Diseases of the heart	321.2	306.8	321.4
Cancer and other malignant tumors	132.4	130.1	134.4
Intracranial lesions of vascular origin	91.4	89.8	97.8
Nephritis	56.0	58.4	66.7
Accidents (excluding motor-vehicle accidents)	46.6	46.2	51.4
Pneumonia (all forms) and influenza	43.1	44.5	51.8
Tuberculosis (all forms)	33.5	36.4	40.1
Premature birth	28.6	28.5	23.9
Diabetes mellitus	26.2	24.8	26.6
Motor-vehicle accidents	22.8	23.9	21.3

Substantial reductions in mortality from oth-

The death rate for motor-vehicle accidents rose from 21.3 in 1945 to 23.9 in 1946, but decreased to 22.8 in 1947. The rate for this cause had dropped sharply during the war years, following wartime restrictions on driving, but began to rise steadily beginning with 1944. However, despite the greater use of automobiles in the postwar than the prewar period, the rates for 1946 and 1947 were well below the peak prewar rate of 30.8 in 1937. The crude death rate for other types of accidents was 51.4 in 1945, declined to 46.2 in 1946, and remained approximately the same, 46.6 in 1947.

Increases occurred in both the number of deaths and the crude death rates for premature birth in 1946 and 1947. However, since deaths from premature birth occur only during the first year of life, changes in the crude death rate for the total population of all ages are poor indices of the changes in mortality from this cause. This is particularly true in years in which rapid changes occur in the number of births. These increases in the deaths and death rates for premature birth reflect the sharp increases in the number of births which occurred in both 1946 and 1947 rather than an actual increase in the risk of mortality. The infant mortality rate per 1,000 live births for this cause rose from 11.6 in 1945 to 12.1 in 1946, but decreased to 11.1 in 1947. Similar consideration should be given to other causes of death related to the first year of life and to maternal deaths.

Population data

The rates presented in this report are based on estimates of the midyear population excluding the armed forces overseas, published by the Bureau of the Census in "Population—Special Reports," Series P-47, No. 3 (for 1945 data) and "Current

* * * the protective food factors—those little things that you and I eat, that enable us to convert our ordinary foods into energy, new skin, blood and cells, and which make it possible for the body chemistry to operate correctly. These elements in our food are called, in the text books of the bio-chemists, *nutrilites*. That's a technical word you won't find in your dictionary, but it means all the little food factors—not the fats, minerals, carbohydrates and proteins we hear so much about, but all the factors such as the vitamins, chlorophyll, bios, inositol, and many others.

* * *

* * * no one knows how many vitamins there are. * * * the nutrilites * * * are all the little vital food factors, including the familiar vitamins. * * * if you want to be healthy, you will make sure that your daily diet includes not only all the vitamins, but *all the nutrilites*.

* * *

* * * Diet deficiencies bring on old age. * * *

* * * diet deficiencies bring on aches and pains. * * * Most of our common diseases, with the exception of germ diseases, but including some of the most painful, the most common causes of death from illness * * * and many which are considered incurable, are the result of dietary deficiencies.

2686 * * * simply through changes in diet, you can * * * bring on premature old age, create a wide variety of aches and pains and illnesses, bring about death or, when the person is deficient, *feed* him back to health!

Any food supplement which is right, and which is able to protect you from the ravages and pain of the deficiency diseases, must contain all the vitamins * * * together with all the nutrilites and minerals so often lacking in our diet.

Nutrilite Food Supplement

FINDING OF FACT

It is the consensus of informed medical opinion that most common diseases do not result from dietary deficiencies and that a product consisting of alfalfa, parsley, and water cress fortified with crystalline vitamins and vitamin concentrates which provides in the suggested daily intake the following:

Vitamin A, 25,000 U.S.P. units.
Vitamin B_1, 20 milligrams.

Vitamin B_2, 10 milligrams.
Vitamin C, 200 milligrams.
Vitamin D, 2500 U.S.P. units.
Vitamin B_{12}, 4 milligrams.
Vitamin E, 10 milligrams.
Vitamin K, 0.4 milligram.
Inositol, 20 milligrams.
Para-aminobenzoic acid, 20 milligrams.

together with a product consisting of bone meal, dicalcium phosphate, iron ammonium citrate, potassium iodide, niacin amide, and pantothenic acid which provides in the suggested daily intake the following:

Calcium, 950 milligrams.
Phosphorus, 562 milligrams.
Iron, 10 milligrams.
Iodine, 0.4 milligram.
Niacin amide, 15 milligrams.
Pantothenic acid, 8 milligrams.

would not be effective in preventing or treating most common diseases.

/s/ Robert C. Butz, M.D., Medical Officer
Food and Drug Administration

December 9, 1948.

2688 CONCLUSION

Pursuant to the provisions of the Federal Food, Drug and Cosmetic Act and regulations promulgated thereunder, I conclude on the basis of the facts reported above by Dr. Robert C. Butz, an employee of the Food and Drug Administration of the Federal Security Agency, that there is probable cause for me to believe and I do believe, that the labeling of this article would be and is in a material respect misleading to the injury or damage of the purchaser or consumer.

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER AND CASSELBERRY, INC., Plaintiff,

v.

OSCAR R. EWING, Federal Security Administrator, et al.,
Defendants.

STIPULATION

It is stipulated by the parties that the following are facts that may be taken as proved in the action above only without formal proof:

1. Records of University of South Carolina show that Rehnborg entered Liberal Arts College in September 1914 and stayed one semester. Studied, among other things, inorganic chemistry, grade 91, and qualitative analysis, no grade.

2. The following information has been obtained from application filed by Rehnborg in the Richfield Oil Company of California in 1932:

1915-1916; Accountant, Standard Oil Company, Tientsin, China.
1916-1918; Accountant, China-America Trading Company, Tientsin.
1918-1919; Comptroller, Lone Star Shipbuilding Corporation.
1919-1923; Sales representative in China, American Milk Products Corporation of New York.
1923-1929; Operated own business, Shanghai.
1929-1932; Chief Clerk, American Potash and Chemical Corporation, Trona, California.
Education; Graduated High School, Shelton, Connecticut.

2690 3. Records of the Richfield Oil Company of California show that he entered their employ July 1932—January 1933, and was employed by them from July 1933 through August 1935 in a clerical capacity, Pay Roll Department, Richfield Oil Corporation of California.

4. Plaintiff reserves the right to object to the introduction of any or all of the facts on the grounds of irrelevancy and immateriality.

Charles S. Rhyne, Attorney for Plaintiff.
Vincent A. Kleinfeld, Attorney for Defendants.

Senility, ill-defined and unknown causes, the tenth leading cause of death in 1945, dropped from the group and was replaced by motor-vehicle accidents in 1946 and 1947. The order of several other causes also changed between 1945 and 1946. Pneumonia and influenza, the fifth leading cause of death in 1945, dropped to sixth place in 1946 and was replaced by accidents excluding motor-vehicle accidents. The order in which diabetes mellitus and premature birth ranked in 1945 was also reversed in 1946.

The 10 leading causes of death accounted for almost 80 percent of the deaths from all causes for each of the 3 years shown. In 1947, 899,233 deaths, or 62 percent of the total (1,445,370), resulted from the leading causes of death chiefly associated with advanced age. These were diseases of the heart, cancer and other malignant tumors, intracranial lesions of vascular origin, nephritis, and diabetes mellitus. Diseases of the heart alone accounted

age groups where mortality is normally low, were overseas with the armed forces. In their absence, persons in the older age groups where death rates are high constituted a large proportion of the population. Thus, with no change in the risk of mortality, crude rates for most causes in 1945 would be expected to be higher than those for 1946. Consequently, part of the decline between 1945 and 1946 in the rates for many causes, especially those associated with the older ages, may reflect changes in population rather than in mortality risk.

For diseases of the heart, the crude death rate declined from 321.4 in 1945 to 306.8 in 1946, and rose to 321.2 in 1947. Similarly, the crude death rate for three of the other major causes of death at the older ages—cancer, intracranial lesions of vascular origin, and diabetes—declined in 1946, then rose in 1947. The crude rate for nephritis, however, declined in both years.

TABLE A.—NUMBER OF DEATHS FROM THE 10 LEADING CAUSES AND PERCENTAGE DISTRIBUTION: UNITED STATES, 1945-47

(Exclusive of stillbirths and of deaths among armed forces overseas. Numbers after causes of death are International List numbers, 1938 revision)

CAUSE OF DEATH	NUMBER			PERCENT		
	1947	1946	1945	1947	1946	1945
ALL CAUSES	1,445,370	1,395,617	1,401,719	100.0	100.0	100.0
Diseases of the heart-----90-95	460,580	429,230	424,328	31.9	30.8	30.3
Cancer and other malignant tumors-----45-55	189,811	182,005	177,464	13.1	13.0	12.7

DEATHS AND DEATH RATES FOR EACH CAUSE: UNITED STATES, 1945-47

This report presents the number of deaths and crude death rates for each cause in the United States for each of the 3 years 1945 to 1947. In this period, the crude death rate for all causes varied from 10.6 per 1,000 estimated population in 1945 to 10.0 in 1946, and 10.1 in 1947. The crude death rates for 1946 and 1947 were the lowest ever recorded for this country in the history of the death-registration area.

Table A shows the number of deaths from the 10 leading causes of death for each year from 1945 to 1947. This group of leading causes remained the same for each of these years with one exception. Senility, ill-defined and unknown causes, the tenth leading cause of death in 1945, dropped from the group and was replaced by motor-vehicle accidents in 1946 and 1947. The order of several other causes also changed between 1945 and 1946. Pneumonia and influenza, the fifth leading cause of death in 1945, dropped to sixth place in 1946 and was replaced by accidents excluding motor-vehicle accidents. The order in which diabetes mellitus and premature birth ranked in 1945 was also reversed in 1946.

The 10 leading causes of death accounted for almost 80 percent of the deaths from all causes for each of the 3 years shown. In 1947, 899,233 deaths, or 62 percent of the total (1,445,370), resulted from the leading causes of death chiefly associated with advanced age. These were diseases of the heart, cancer and other malignant tumors, intracranial lesions of vascular origin, nephritis, and diabetes mellitus. Diseases of the heart alone accounted for 32 percent of all deaths in 1947, or nearly two and a half times as many deaths as cancer, the second leading cause of death.

The crude death rates per 100,000 estimated population for the leading causes of death in the United States are shown in table B for the 3 years 1945 to 1947. These rates are computed for the population present in the country, excluding the armed forces overseas. In comparing rates for 1945 with those for 1946 and 1947, consideration must be given to the effect of changes in population composition during these years. In 1945 a large group of men, selected for physical fitness and in age groups where mortality is normally low, were overseas with the armed forces. In their absence, persons in the older age groups where death rates are high constituted a large proportion of the population. Thus, with no change in the risk of mortality, crude rates for most causes in 1945 would be expected to be higher than those for 1946. Consequently, part of the decline between 1945 and 1946 in the rates for many causes, especially those associated with the older ages, may reflect changes in population rather than in mortality risk.

For diseases of the heart, the crude death rate declined from 311.4 in 1945 to 306.8 in 1946, and rose to 321.2 in 1947. Similarly, the crude death rate for three of the other major causes of death at the older ages—cancer, intracranial lesions of vascular origin, and diabetes—declined in 1946, then rose in 1947. The crude rate for nephritis, however, declined in both years.

Diseases of the heart-----	321.2	306.8	321.4
Cancer and other malignant tumors----------	132.4	130.1	134.4
Intracranial lesions of vascular origin---------	91.4	89.8	97.8
Nephritis----------	56.0	58.4	66.7
Accidents (excluding motor-vehicle accidents)-	46.6	46.2	51.4
Pneumonia (all forms) and influenza----------	43.1	44.5	51.8
Tuberculosis (all forms)--	33.5	36.4	40.1
Premature birth----------	28.6	28.5	23.9
Diabetes mellitus---------	26.2	24.8	26.6
Motor-vehicle accidents---	22.8	23.9	21.3

Substantial reductions in mortality from other infectious diseases also occurred in both 1946 and 1947. The rate for syphilis was 8.8 in 1947 as compared with 10.7 in 1945, a total decrease of 18 percent in this period. The rate for diarrhea, enteritis, and ulceration of the intestines declined from 8.7 in 1945 to 5.6 in 1947, and that for diphtheria from 1.2 to 0.6. These decreases for diarrhea and diphtheria continue the rapid long-term downward trends for these causes. While these diseases were of relatively minor importance as causes of death in 1947, they ranked among the 10 leading causes in 1900.

Considerable fluctuation is found in the crude death rates for certain of the communicable diseases common in childhood. The rate for measles rose from an all time low of 0.2 in 1945 to 0.9 in 1946 and then declined to 0.3 in 1947. The rate for whooping cough declined from 1.3 in 1945 to a record low of 0.9 in 1946 and then rose to 1.4 in 1947. The rates for poliomyelitis and polioencephalitis were 0.9 and 1.3 in 1945 and 1946, respectively, but in 1947 the rate declined to 0.4.

flect the sharp increases in the number of births which occurred in both 1946 and 1947 rather than an actual increase in the risk of mortality. The infant mortality rate per 1,000 live births for this cause rose from 11.6 in 1945 to 12.1 in 1946, but decreased to 11.1 in 1947. Similar consideration should be given to other causes of death related to the first year of life and to maternal deaths.

Population data

The rates presented in this report are based on estimates of the midyear population excluding the armed forces overseas, published by the Bureau of the Census in "Population—Special Reports," Series P-47, No. 3 (for 1945 data) and "Current Population Reports: Population Estimates," Series P-25, No. 22 (for 1946 and 1947 data).

Cause of death

Deaths are classified by cause according to the rubrics of the International List of Causes of Death, 1938 revision, and special coding rules contained in the annual editions of the Vital Statistics Instruction Manual. When two or more morbid conditions are shown on the death certificate, selection of the primary cause to which the death is assigned is made according to the priority listings of the Manual of Joint Causes of Death, fourth edition, and special coding rules as shown in the Instruction Manual.

The ranking of the leading causes of death is based on a list of 57 selected categories of the International List of Causes of Death, which include certain combinations of related rubrics.

OF THE UNITED STATES

October Term, 1949

No. 568

STATEMENT OF POINTS TO BE RELIED UPON AND DESIGNATION OF PARTS OF THE RECORD NECESSARY FOR CONSIDERATION THEREOF—Filed Feb. 8, 1950

1. Now come the Appellants in the above cause and for their statement of points upon which they intend to rely in their appeal in this Court adopt the points contained in their Assignment of Errors heretofore filed herein.

2. Appellants deem all the parts of the record in this cause which were filed in this Court pursuant to the appellants' praecipe to the Clerk of the United States District Court for the District of Columbia necessary for the consideration of the foregoing points, and appellants designate those parts of said record described in said praecipe and filed in this Court pursuant to said praecipe for printing by the Clerk of this Court.

Philip B. Perlman
Solicitor General

Dated: February 8, 1950

2711 CERTIFICATE.

I hereby certify that a true copy of the attached Statement of Points to be Relied upon and Designation of Parts of the Record Necessary for Consideration Thereof was duly served on the appellee on this 8 day of February, 1950, by depositing in the United States mails copies thereof addressed to Charles S. Rhyne, counsel for appellee.

Vincent A. Kleinfeld

No. 568

APPELLEE'S DESIGNATION OF RECORD FOR PRINTING

Filed Feb. 20, 1950

Now comes the Appellee in the above cause and hereby designates the following part of the record, prepared by the Clerk of the United States District Court for the District of Columbia and filed in this Court, for printing by the Clerk of this Court:

1. Transcript of Hearing on Plaintiff's Motion for Modification of Pre-Trial order before Judge Goldsborough on September 21, 1949.

Respectfully submitted,
Charles S. Rhyne
Lester L. Lev
Attorneys for Appellee

Dated: February 20, 1950

2714 CERTIFICATE OF SERVICE

Service of Appellee's Designation of Record for Printing was had by mailing a copy thereof on February 20, 1950 to the Honorable Philip B. Perlman, Solicitor General of the United States, Department of Justice, Washington, D. C.

Charles S. Rhyne
Attorney for Appellee

Dated: February 20, 1950

In the United States District Court

FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER & CASSELBERRY, A CALIFORNIA CORPORATION, PLAINTIFF

v.

OSCAR R. EWING, FEDERAL SECURITY ADMINISTRATOR; J. HOWARD MCGRATH, ATTORNEY GENERAL; PAUL B. DUNBAR, COMMISSIONER OF FOOD AND DRUGS; CHARLES W. CRAWFORD, ASSOCIATE COMMISSIONER OF FOOD AND DRUGS; GEORGE P. LARRICK, ASSISTANT COMMISSIONER OF FOOD AND DRUGS; AND LOUIS D. ELLIOTT, ASSISTANT COMMISSIONER OF FOOD AND DRUGS, DEFENDANTS

STATEMENT AS TO JURISDICTION

The defendants-appellants, having this day presented their petition for appeal, now pursuant to United States Supreme Court Rule 12, paragraph 1, file this their statement of the basis upon which it is contended that the Supreme Court of the United States has jurisdiction on a direct appeal to review the final decree of permanent injunction in question, and should exercise such jurisdiction in this case.

OPINION BELOW

The district court delivered no written opinion or discussion of the case, but did make certain findings of fact and conclusions of law in connection with the entry of the decree in question. Copies

of these findings and conclusions, and of the final decree herein, are attached to this jurisdictional statement.

JURISDICTION

The appeal herein is from a final decree made and entered by a United States District Court for the District of Columbia specially constituted under 28 U. S. C. 2282 and 2284 upon the plaintiff's application for an interlocutory and permanent injunction to restrain the enforcement, operation, or execution of an Act of Congress, to wit, a part of Section 304(a) of the Federal Food, Drug, and Cosmetic Act, 52 Stat. 1044, 21 U. S. C. 334(a), for repugnance to the due process clause of the Fifth Amendment to the Constitution of the United States.

The Supreme Court of the United States has jurisdiction to review by direct appeal the judgment and decree complained of by the provisions of 28 U. S. C. 1253 and 2101(a). The following decisions are believed to sustain the jurisdiction of the Supreme Court to review the judgment on direct appeal in this case. *Jameson & Co.* v. *Morgenthau*, 307 U. S. 171; *Phillips* v. *United States*, 312 U. S. 246; and *California Water Service* v. *Redding*, 304 U. S. 252.

The final decree appealed from was made and entered on December 14, 1949.

The application for appeal was presented on January 9, 1950.

QUESTIONS PRESENTED

Section 304(a) of the Federal Food, Drug and Cosmetic Act permits more than one libel against different articles similarly misbranded "when the Administrator has probable cause to believe from facts found, without hearing, * * * that the

misbranded article is dangerous to health, or that the labeling of the misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer." The principal questions presented are:

(1) Whether the above provision is unconstitutional because the Administrator may act without holding a hearing prior to authorizing the judicial proceeding.

(2) Whether the District Court lacked jurisdiction to review the Administrator's determination of probable cause, or to determine, in advance of the libel proceedings, whether the appellee's labeling is misleading.

(3) If these questions are not both answered in favor of the appellants, the additional questions raised in the assignment of errors will also be presented. These include (a) whether the District Court erred in holding that the action of the administrative officials was without reasonable basis, and (b) whether the District Court seriously erred in excluding evidence offered by the Government and improperly admitting evidence, sometimes of the same type, offered by the plaintiff.

STATUTE INVOLVED

The statute of the United States that is involved is the Federal Food, Drug, and Cosmetic Act of June 25, 1938, c. 675, 52 Stat. 1040, 21 U. S. C. 301 *et seq.* The particular section of that Act involved is Section 304(a), 52 Stat. 1044, 21 U. S. C. 334(a), which provides in pertinent part as follows:

> (a) Any article of . . . drug . . . that is . . . misbranded when introduced into or while in interstate commerce . . . shall be

liable to be proceeded against . . . on libel of information and condemned in any district court of the United States within the jurisdiction of which the article is found: *Provided however,* That no libel for condemnation shall be instituted under this Act, for any alleged misbranding if there is pending in any court a libel for condemnation proceeding under this Act based upon the same alleged misbranding, and not more than one such proceeding shall be instituted if no such proceeding is so pending, except that *such limitations shall not apply* (1) when such misbranding has been the basis of a prior judgment in favor of the United States, in a criminal, injunction, or libel for condemnation proceedings under this Act, or (2) *when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency* that the misbranded article is dangerous to health, or *that the labeling of the misbranded article* is fraudulent, or *would be in a material respect misleading to the injury or damage of the purchaser or consumer.* * * * (Italics ours.)

The District Court held that the italicized portion of the statute is unconstitutional under the due process clause of the Fifth Amendment to the Constitution.

STATEMENT

Mytinger & Casselberry, Inc., is the exclusive national distributor of "Nutrilite Food Supplement", an encapsulated concentrate of alfalfa, watercress, and parsley fortified with synthetic vitamins and sold in a combination package with mineral tablets. The labeling consists in part of various editions of a booklet entitled "How to Get Well and Stay Well", a carefully conceived writ-

ing that is used by salesmen in soliciting contracts calling for delivery of a year's supply of Nutrilite, which costs approximately $200 per year payable in monthly installments.

An edition of the booklet in use until May 1948 was the basis for an indictment returned in the Southern District of California against Mytinger & Casselberry, a partnership, and Lee S. Mytinger and William S. Casselberry, charging a deliberate offense against the Federal Food, Drug, and Cosmetic Act. The booklet was revised during the investigation which preceded the indictment, and the 58 page booklet, involved in the present case, was the result.

On September 28, 1948, the defendant Charles W. Crawford, Associate Commissioner of Food and Drugs, recommended that a seizure case be instituted against a shipment of "Nutrilite Food Supplement" found in Belleville, New Jersey. The action was filed on October 6, 1948, upon a libel that alleged that the drug was misbranded when introduced into interstate commerce because of false labeling representations as to its therapeutic effect. The statements on which the charge of misbranding was based were taken from pages 37-58 of the booklet.

On September 30, another seizure recommendation came before Mr. Crawford in the regular course of business based upon the same alleged misbranding. With the papers was a finding of fact in writing signed by Robert C. Rutz, a medical officer of the Food and Drug Administration, dated September 30, 1948 which stated that "Nutrilite Food Supplement" when taken as directed would not be effective in the treatment of a number of symptoms and conditions that were enumerated.

Mr. Crawford, after considering the finding which advised him of the medical facts, and after considering the 58-page booklet (more particularly pages 37-58) which was a part of the labeling, concluded that there was probable cause to believe and that he did believe that the labeling of the drug would be in a material respect misleading to the injury or damage of the purchaser or consumer. His action was taken in accordance with 21 U. S. C. 334(a), and thereafter 3 additional libel suits were recommended on behalf of the Federal Security Agency and were filed by the appropriate United States Attorneys.

Subsequent revisions of the booklet came before defendants Larrick and Dunbar, and similar determinations of probable cause were made on December 2 and 9. Libel suits were filed on the basis of these determinations.

This suit was filed on December 30, 1948. On January 24, 1949, Judge David A. Pine of the United States District Court for the District of Columbia, questioned the authority of Defendants Crawford, Larrick, and Dunbar, as delegatees, to make the probable cause determinations. The defendants were given an opportunity to present the matter to the Federal Security Administrator, and on January 28, 1949, Acting Administrator J. Donald Kingsley made the same determinations. The motion to dismiss was renewed, and Judge Pine granted it on March 3, 1948.

An amended complaint was filed the same day. It alleged that the multiple seizure provisions of 21 U. S. C. 334(a) were unconstitutional under the due process clause of the Fifth Amendment in failing to provide for a hearing prior to the determination of probable cause (Par. 18(e)). Arbi-

trary and capricious action on the part of the defendants in the administration of the Federal Food, Drug, and Cosmetic Act also was alleged (Par. 9, 11, 12, 15, 18(d), 13, 14, 16, 18, 19, 20, 21, 22 and 26).

Application was made for a three-judge statutory court. District Judge Edward A. Tamm granted a temporary restraining order on March 4, 1949. After a hearing on defendants' motion to dismiss, the three-judge court granted a temporary injunction on April 6, 1949, without hearing evidence and without making findings of fact.

Defendants answered, challenging the Court's jurisdiction to try the issue whether plaintiff's labeling was materially misleading and alleging that they had acted pursuant to 21 U. S. C. 334(a).

A petition for writs of prohibition and/or mandamus was filed in the Supreme Court on the ground that the district court was acting in excess of its jurisdiction in undertaking a trial *de novo* on the issue whether the plaintiff's labeling was materially misleading. The petition was denied on May 16, 1949. No. 597 Misc., October Term, 1948. 337 U. S. 902.

The case was tried in October, 1949, on two issues: (1) the constitutionality of the provision of Section 304(a) of the Federal Food, Drug, and Cosmetic Act under which the defendants made their administrative determinations, and (2) whether the defendants acted arbitrarily, unlawfully, oppressively and capriciously in making the determinations without affording the plaintiff a preliminary administrative hearing.

The Court found that Nutrilite is not harmful *per se* (Finding 5), that the administrative determinations of probable cause were made *ex parte* (Findings 17, 23, 29, 30 and 35), that no separate issues of fact or law, and no public emergency,

necessitated more than one libel suit (Findings 22, 42), and that damage, through loss of potential sales and costs of litigation, followed the filing of the suits.[1] The Court concluded that the portion of section 304(a) of the Federal Food, Drug, and Cosmetic Act, referred to above, was unconstitutional and that defendants should be permanently enjoined from enforcing it against plaintiff (Concl. 1).

THE QUESTIONS ARE SUBSTANTIAL

A. *The Constitutional Question*

The District Court has held unconstitutional that part of Section 304(a) which permits the Administrator to recommend the institution of multiple seizure suits, i.e., civil actions for condemnation against more than one shipment of a drug, each shipment alleged to be misbranded in the same way, when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency that the labeling of the misbranded drug would be in a material respect misleading to the injury of the purchaser or consumer. The provision was held to be repugnant to the due process clause of the Fifth Amendment because of its failure to provide the

[1] Other findings were made as to the arbitrary and capricious action of the defendants (Findings 9, 12(e) and (f), 13-18, 21-22, 24, 26, 29-32, 35, 38-43) and the good faith of the plaintiff (Findings 8-10, 12-13, 19-20). No conclusion of law followed these findings, but the Court did conclude that the defendants acted arbitrarily, oppressively, and capriciously in instituting multiple libel proceedings without first affording the plaintiff a hearing on the issue whether there was probable cause to believe that the labeling was misleading in a material respect (Concl. 4). Since these findings and the conclusions do not bear upon the Supreme Court's jurisdiction to review this case on direct appeal they will not be discussed further here. *Jameson & Co.* v. *Morgenthau*, 307 U.S. 171.

shipper an opportunity for a preliminary hearing before the Administrator prior to the administrative "probable cause" decision.

The express language of Section 304(a) clearly excludes a preliminary administrative hearing, and we respectfully submit that the section does not contravene the due process clause of the Fifth Amendment. If the provision of the statute which imposes conditions upon the bringing of more than one action based upon the same alleged misbranding, were not in the law, a shipper of an article made offensive and illicit because of misbranding who forwarded his drug into many parts of the United States would have no right to complain that his product was being proceeded against in each jurisdiction where found. A person who has violated the same law in different transactions in 16 jurisdictions, and has been prosecuted in each jurisdiction for his transgression, has no constitutional right to insist that no more than one prosecution be brought. And a claimant of seized merchandise would have no immunity from all but one seizure. The restrictions upon multiple actions found in Section 304(a) were not devised to take from the citizen any rights he had had. Rather, Congress imposed a limitation upon administrative action to stay the hand of enforcement in specific cases.

The determination of probable cause, authorized by Section 304(a), is preliminary in nature as a predicate to the institution of multiple law suits. After institution the claimant may defend each action or may consolidate them for a single defense. 21 U. S. C. 334(b). In such defense, he is entitled to a complete trial on the merits of the Government's claimed right to condemnation. But Congress provided that no hearing be held in connec-

tion with the probable cause determination in order to make possible the prompt application of the Act against fraudulent articles, dangerous articles, and seriously misleading articles. The provision in question was an attempt to strike a balance of interests in protection of both the consuming public and shippers of commodities.

While the Constitution may require a hearing by an administrative agency when an issue is committed to administrative adjudication rather than to judicial determination, it obviously does not require an administrative hearing as a prerequisite to an administrative agency's right to report facts to prosecuting officials for trial and determination in a district court. The Constitution does not require that those functions of Government that traditionally have been conducted as investigative and reporting activities preliminary to a law suit must be conducted by judicial methods.

In considering the due process contention it is appropriate to inquire as to the nature of the "property" that is being taken as a result of the administrative determination of probable cause. Cf. *Federal Communications Commission* v. *W. J. R., The Goodwill Station*, 337 U. S. 265. The determination does not have the effect of finally adjudicating the character of the drug. The drug can be condemned only after a complete trial at which the claimant may present witnesses and arguments to show that the article is not misbranded.

The District Court apparently has held that whenever the property of a person is temporarily taken into custody of law pursuant to judicial process, a denial of due process results unless such

individual has had an opportunity to be heard before administrative officials prior to such deprivation. It is clear that this theory, if applicable in a case of property, should likewise be applicable with even greater force in a case where the liberty of an individual is at stake. But an indictment returned by a grand jury, which does not grant the defendant a hearing, or indeed any notice of its proceedings, and the subsequent commitment of the accused pending trial are not violative of the due process clause. The Supreme Court has held that an indictment, fair on its face, returned by a regularly constituted grand jury *conclusively* determines the existence of probable cause for the purpose of holding the accused to answer. *Ex parte United States*, 287 U. S. 241.

The analogy to the case at bar is clear. The accused in a criminal proceeding has the opportunity to vindicate himself at trial. So, too, here the drug may be vindicated at trial, but due process does not require that a prospective claimant be given notice and opportunity to be heard by the Administrator before the Administrator determines that probable cause exists and recommends multiple seizures.

B. *The District Court Was Without Jurisdiction to Review the Probable Cause Determinations or to Try the Issue Whether Plaintiff's Labeling Was Misleading*

By Section 304(a), Congress has established a procedure for the protection of the consumer against misleading as well as dangerous labeling through multiple libel actions which may be instituted upon an administrative determination of

probable cause. The claimant is protected against harassment by his right to consolidate the cases for a single trial in any of the districts he may select. Section 304(b), 21 U. S. C. 334(b). The history of the statute set forth below shows[2] that

[2] Under the Federal Food and Drugs Act of 1906, 34 Stat. 771, goods that were adulterated or misbranded were subject to seizure wherever found, and multiple seizures regularly were made. The Act of 1906 was revised comprehensively in 1938. Bills originally proposed provided for executive seizures of articles "dangerous to health" (S. 2000, Sec. 16(a), and S. 2800, Sec. 16(a), 73rd Cong., 2d Sess. Dunn, *Federal Food, Drug, and Cosmetic Act* (1938) 61, 81, 102) and placed no limitation on the number of libel actions. This was subsequently redrafted to allow the United States district courts to restrain a multiplicity of seizures in specified cases. See S. 2800, Section 19(c), *Dunn*, p. 105. The Senate at one time accepted an amendment prohibiting multiple seizures except after a judicial show-cause order proceeding. S. Rep. 361, 74th Cong., 1st Sess., Part 2, p. 11, *Dunn*, pp. 263, 389, 399, 468-469. A later draft eliminated the provision for executive seizures, and authorized multiple libel actions in case of misbranding when the Secretary had probable cause to believe from facts found by him that the article was so misbranded as to render it imminently dangerous as to health or when the alleged misbranding had been the subject of a prior judgment. *Dunn*, pp. 505-506.

Three further changes were made, all pertinent here. A provision was added authorizing multiple seizure in cases where the Secretary had probable cause to believe that the misbranding was in a material respect false, misleading or fraudulent. *Dunn*, pp. 546, 558. The House Committee Report (H. Rept. 2755; 74th Cong., 2d Sess., *Dunn*, pp. 550, 558) stated:

> "There are two substantive changes made by this committee. One is that multiple seizures would be permitted in cases where the Secretary has probable cause to believe that the misbranding is in a material respect false, misleading, or fraudulent. This will permit protection of the public against such nostrums as a brew of weeds labeled as a treatment for diabetes and against innumerable other cheats and frauds which at best rob the consumer's pocketbook, and at worst rob him of health or life through his mistaken reliance upon them while his disease progresses unchecked. With this change the seizure section will continue to function as a 'means of arresting the bullet in flight before it claims its victim,' although the administrative agency will have materially

these provisions were very carefully considered, and that Congress eliminated a provision which would have allowed the courts to restrain multiple seizures.

That the district court lacked jurisdiction to substitute itself for the Administrator by trying *de novo* the issue of misleading labeling or to review the Administrator's preliminary determination of probale cause appears not only from the general statutory plan, which vests in the libel courts sole authority to hear the merits of the cases, but from other factors as well. Several sections of the Federal Food, Drug and Cosmetic Act authorize judicial review of administrative action. Sections 505(h), 701(f), 21 U. S. C. 355(h) and 371(f). The absence of any such provision with respect to the preliminary finding of probable cause manifests a legislative intent that there be no review of such a finding, much more clearly than in the statute before the Court in *Switchmen's Union* v. *National Mediation Board*, 320 U. S. 297. Furthermore, the finding as to probable cause is obviously preliminary in nature. All it does is to permit the institution of law suits, in which the controversial issues may be submitted to a court. Preliminary orders are not reviewable in an injunction suit when they culminate in further administrative action. *Rochester Telephone Corp.* v. *United States*, 307 U. S. 125, 130-131, and cases cited. When the preliminary administrative de-

---

less latitude, in making multiple seizures, when it had under the present law for the past 30 years."

The committee eliminated the provision of the Senate bill which gave the district courts jurisdiction to restrain a multiplicity of seizure actions. *Dunn*, pp. 429, 558. And finally the conference committee inserted the words "without hearing" in the provision requiring the Administrator to make a finding as to probable cause. *Dunn*, pp. 974, 992-3.

termination merely has the effect of authorizing the filing of lawsuits, the absence of jurisdiction in any other tribunal to review the administrative finding should be even clearer.

Under Section 304, the administrative finding of probable cause is to be made without hearing, undoubtedly because a hearing would follow immediately in the libel proceeding. But the court below held a hearing *de novo* on the "merits" of the case in order to determine whether the Administrator should have made the preliminary finding. Cf. *Shields* v. *Utah Idaho R. Co.*, 305 U. S. 177, 185; and *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177. We submit that this plainly was not within the authority of the district court.

The procedure followed by the district court is not only clearly contrary to the congressional policy embodied in the statute, but is contrary to the public interest which that policy was designed to protect—the safeguarding of the public health and purse against deception. The sanction of multiple actions is essential to arrest the distribution of a dangerous product, a fraudulent product, or a materially misleading product before it has claimed its victims and before irreparable injury is done. Without the sanction, there is no way in which dangerous, fraudulent, or seriously misleading drugs may be removed from the market and held within the custody of law pending a determination of the alleged misbranding. Under the decision of the three-judge court, all persons who distribute seriously misleading drugs throughout the country would have the right to challenge the Government's libel allegations in injunction suits in the District of Columbia whenever the Government thought it

in the public interest to seize more than one shipment of the product. This might well stay the arm of enforcement for months while either the misleading character of the labeling or the "probable cause" issue was in litigation. It was precisely to avoid the evils of such delay that the Administrator was authorized to make the determination of probable cause without hearing. If the court has the right to try the merits of the issue *de novo*, the beneficial effects of the expeditious procedure prescribed for administrative action are nullified; and great public harm can be done through widespread distribution of seriously mislabeled articles before the administrative officials may report the shipments of contraband for the institution of appropriate action.

More is involved here than the rights of the parties litigant. The public has an important stake in the outcome. No means exist to protect the consumer from the consequences of protracted proceedings. The injury to the public is direct in terms of money expended for a materially misbranded drug and in terms of health hazards inherent in experimenting with the drug in the treatment of what may well be serious disorders which require prompt, competent medical attention. This was deemed by Congress to outweigh possible harm to purveyors of drugs through temporary interruption of their business.

C. Other Errors of the Court Below

The defendants have challenged many other rulings of the district court, each of which would be ground for reversal. These relate to (1) the probing of the mental processes of administrative

officials; (2) the scope of the injunction that issued; (3) the findings of arbitrary and capricious action in the administrative process; (4) the finding that the labeling was not misleading; (5) the evidence and findings as to plaintiff's good faith; (6) unreasonable curtailment of defendants' right to cross-examination; (7) the improper admission of evidence in support of the plaintiff's case; and (8) the exclusion of proper evidence offered to support the defendants' case.

Many of these errors are serious and important. Inasmuch, however, as the two major questions already treated are sufficient to dispose of the case, and are clearly substantial, it does not seem necessary to discuss these additional points in this statement. Since this case is one required to be heard by a district court of three judges, the Supreme Court has jurisdiction of the case on appeal, and that jurisdiction extends to every question involved in the case. *Sterling* v. *Constantin*, 287 U. S. 378, 393, 394; *Siler* v. *Louisville & Nashville R.R. Co.*, 213 U. S. 175; and *Horner* v. *United States*, 143 U. S. 570, 576.

CONCLUSION

The question as to the lack of jurisdiction in the court below to determine whether plaintiff's labeling was misleading and to review the administrator's preliminary determination of probable cause was argued before this court on the application for prohibition and mandamus last May. We believe that plaintiff's contentions with respect to that point, as well as on the question of constitutionality, though accepted below, are plainly without merit. We respectfully suggest that this Court may find this case an appropriate one for reversal

without further argument, and dismissal of the complaint. *Securities and Exchange Commission* v. *Otis & Co.*, No. 244, this Term, decided October 17, 1949.

Respectfully submitted,

PHILIP B. PERLMAN,
Solicitor General.

APPENDIX

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER & CASSELBERRY, INC., PLAINTIFF

v.

OSCAR R. EWING, ADMINISTRATOR, ET AL., DEFENDANTS

PERMANENT INJUNCTION

This cause came on to be tried upon the issues raised in plaintiff's complaint for a permanent injunction as set forth in the Pre-Trial Order herein. After hearing and considering the evidence presented at the trial and upon the Findings of Fact and Conclusions of Law made and filed herein, it is by this Special Three-Judge Statutory United States District Court for the District of Columbia this 14th day of December, 1949,

Adjudged, ordered and decreed that the defendants, and each of them, their successors in office, their agents, servants, employees, attorneys and all persons in active concert and participation with them be and hereby are permanently enjoined from continuing or causing to be continued the prosecution of any of the libel for condemnation actions now pending against Nutrilite Food Supplement; and it is further

Adjudged, ordered and decreed that the defendants, and each of them, their successors in office, their agents, servants, employees, attorneys, and all persons in active concert and participation with them be and hereby are permanently enjoined from instituting or causing to be instituted any further or additional libel for condemnation actions, or any other actions, against Nutrilite Food Supple-

ment under that part of 21 U. S. C. 334(a) herein held to be unconstitutional to wit: "such limitations shall not apply . . . when the Administrator has probable cause to believe from the facts found, without hearing, by him or any officer or employee of the agency that . . . the labeling of the misbranded article . . . would be in a material respect misleading to the injury or damage of the purchaser or consumer.

BENNETT C. CLARK,
Circuit Judge.
T. ALAN GOLDSBOROUGH,
District Judge.
EDWARD A. TAMM,
District Judge.

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER & CASSELBERRY, INC., PLAINTIFF

vs.

OSCAR R. EWING, ADMINISTRATOR, ET AL., DEFENDANTS

FINDINGS OF FACT AND CONCLUSIONS OF LAW

This cause came on to be heard before this specially constituted Court of three judges convened pursuant to the provisions of Section 2284, Title 28, U. S. C. Evidence and briefs having been submitted, oral argument of counsel had and the Court being now duly advised in the premises makes the following Findings of Fact and enters the following Conclusions of Law:

FINDINGS OF FACT

1. Plaintiff is a California corporation, having its principal place of business in the City of Long

Beach, California. Defendant Oscar R. Ewing is the Administrator of the Federal Security Agency; Defendants Paul B. Dunbar, Charles W. Crawford, Louis D. Elliott and George P. Larrick are the Commissioner, Associate Commissioner and Assistant Commissioners, respectively, of the Food and Drug Administration of the Federal Security Agency; and Defendant J. Howard McGrath is the Attorney General of the United States and was substituted as a defendant in place of Tom C. Clark on October 17, 1949. Defendants are all charged by law with the administration and enforcement of the Federal Food, Drug and Cosmetic Act of 1938.

2. This suit arises from administrative action taken by the defendants under that part of Section 304(a) of the Federal Food, Drug and Cosmetic Act (21 U. S. C. 301, 334(a)) which provides that more than one libel for condemnation proceeding may be brought upon the same alleged misbranding "when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employe of the Agency that . . . the labeling of the misbranded article . . . would be in a material respect misleading to the injury or damage of the purchaser or consumer"; and under Sections 2282 and 2284 of Title 28 of the United States Code, Judiciary and Judicial Procedure, which provides the procedure by which this court was convened to hear an application to restrain the enforcement, operation, or execution of the Federal Food, Drug and Cosmetic Act (21 U. S. C. 301 et seq.) for repugnance to the United States Constitution. (Complaint, Par. 2; Answer, Third Defense, Par. 2.)

3. The plaintiff is the exclusive national distributor of a food supplement consisting of multiple vitamins and minerals sold under the trade name of "Nutrilite Food Supplement" (hereinafter called Nutrilite) through more than 5,000 distributors throughout the United States.

4. Nutrilite contains certain vitamins and minerals in a balanced proportion and in amounts claimed by some experts in the field as essential in human nutrition, plus extracts from alfalfa, parsley and watercress.

5. Nutrilite contains no substance or material or combination of substances or materials harmful or deleterious in any manner to human users thereof when taken in suggested dosage. No claim has been made by any Federal, State or other governmental agency that Nutrilite is adulterated or harmful in any manner to the health of human users thereof, insofar as the record before the court shows.

6. The label of the package in which Nutrilite was and is sold complies with all requirements of the Food, Drug and Cosmetic Act of 1938.

7. The objection of the defendants to the sale of Nutrilite, which is the basis of this action, is the use by plaintiff of an advertising pamphlet entitled "How to Get Well and Stay Well". Nutrilite is sold directly to users thereof and this pamphlet is used in making about 40% of the initial sales of Nutrilite.

8. The product now sold as Nutrilite was first marketed about 1933; defendants' records show they received information about it in 1939 and had correspondence about it in 1940; plaintiff has been its exclusive national distributor since 1945; defendants received their first copies of the then current edition of the pamphlet "How to Get Well and Stay Well" on December 5, 1946, together with names and addresses of certain of plaintiff's distributors outside of California.

9. In June 1947, the Food and Drug Administration sent plaintiff a notice of a hearing under Section 305 of the Food, Drug and Cosmetic Act of 1938. This notice and hearing are provided for prior to institution of criminal proceedings under the Act and said notice provided that it related

solely to "possible criminal action" and not to action "involving the seizure of the article" in libel cases. At the time of the hearing, July 15, 1947, Nutrilite Products had been in business some 15 years and up to 5 years before the time of said hearing Nutrilite representatives had been bringing Nutrilite labeling to the Los Angeles office of the Food and Drug Administration for comment and there had been no change in the labeling in the preceding five years. Neither the notice nor the statements of the Food and Drug Administration representative at the hearing specified any exact objections to particular language in the then current edition of the pamphlet "How to Get Well and Stay Well", but plaintiff's attorney advised plaintiff he thought he understood the objections of the Food and Drug Administration and he advised the Food and Drug Administration's representative that the pamphlet would be revised to eliminate these objections.

10. Plaintiff's attorney further advised the Food and Drug Administration on October 4, 1947, that the rewriting of plaintiff's pamphlet had commenced promptly and was progressing as rapidly as possible considering the quantity of the material involved and the corrections required by him and that when finally completed he was sure none of the literature of plaintiff would be objectionable to said Administration.

11. There are three editions of the plaintiff's advertising pamphlet, "How to Get Well and Stay Well", which are involved in the libel seizure cases, hereinafter described: the 58-page edition which was used by plaintiff from January 1948 until a few days after the first seizure in October, 1948, and which is identified in the record as plaintiff's Exhibit #1; the 36-page edition consisting of the first 36 pages of the 58-page edition, which was used from the time the 58-page edition was discontinued up to about December 1, 1948, and which is identified in the record as plaintiff's Exhibit #2;

and the 42-page edition consisting of the 36-page edition changed slightly in non-substantial statements plus 6 additional pages, which has been used from about December 1, 1948 up to the time of the trial herein, and which is identified in the record as plaintiff's Exhibit #3.

12. (a) Three editions of the advertising pamphlet "How to Get Well and Stay Well" which are involved in and form the basis of the seizure actions hereinafter described, were written and prepared chiefly by William S. Casselberry, President of the plaintiff corporation. He has an A.B. degree from the University of California and M.A. and Ph.D degrees from Stanford University. Prior to writing "How to Get Well and Stay Well" he read some medical and nutritional literature on the subject of vitamins and minerals. In the preparation of the three pamphlets he relied upon some scientific and medical treatises; surveys made by the medical profession with respect to the use of vitamins and minerals; publications of the Federal Government relating to the amount of vitamins and minerals required in the diet of humans and the efficacy of vitamins and minerals in human nutrition; and the findings and statements made by the Food and Drug Administration with respect to the need for and desirability of vitamins and minerals in the human diet.

(b) The rewriting of the pamphlet required a period of approximately five months. During this period Dr. Casselberry checked the various drafts of the pamphlet with his company's attorney, the chemist who discovered and developed Nutrilite's secret base, and with neighbors to get the reactions of laymen to the pamphlet.

(c) Plaintiff's attorney, who supervised the rewriting, has specialized in the Food and Drug Act field for many years. He has in his library, and has read, a number of books and scientific writings written by medical doctors and others in the field of nutrition, vitamins and minerals. Defendants

have stated that he is an experienced attorney in this field. He has approved the final drafts of each edition of the pamphlet before plaintiff began using them.

(d) The beneficial effects of vitamins and minerals for nutritional deficiencies is a well established medical fact. Many of the statements in the pamphlet about the beneficial effects of particular vitamins and minerals for nutritional deficiencies are confirmed by the admissions of the defendants herein.

(e) The three pamphlets (P.'s Exs. #1, 2 and 3), when read as a whole and fairly interpreted, without lifting statements therein out of context, do no more than represent that Nutrilite is a vitamin-mineral food supplement designed and intended to build up the bodies of human users thereof in order that it may aid nature to help the users enjoy better health through better nutrition. Said pamphlets do not represent to the minds of ordinary, reasonable and prudent persons that all of the symptoms, conditions and diseases of the human body necessarily or generally result from dietary deficiencies alone, or that all of the symptoms, conditions and diseases of the human body can be prevented, cured or treated by the use of Nutrilite, and said pamphlets do not represent, suggest, or imply that Nutrilite is a medicine or drug, or that it is efficacious or beneficial in the prevention, treatment or cure of all diseases.

These pamphlets represent the product only as a food supplement containing vitamins and minerals beneficial to building up health and bodies and in alleviating, in some but not in all instances, symptoms resulting from vitamin and mineral deficiencies in the diet. Purchasers and consumers do not understand from these pamphlets that Nutrilite is a treatment or cure for any disease. The defendants' own survey to determine the impression gained by purchasers and consumers of the representations contained in these pamphlets under customary

conditions of purchase and use reveals that the users interviewed uniformly came to these conclusions and understandings of the statements in the pamphlets.

(f) These three pamphlets when read as a whole are not fraudulent, misleading in a material respect to the injury or damage of the purchaser or consumer, or false or misleading in any particular. Neither Nutrilite nor its labeling has been made the basis of a prior judgment in favor of the United States in any case or proceedings finding it to be misbranded or adulterated, nor do these pamphlets misbrand the product Nutrilite Food Supplement within the intent of the provisions of the Food, Drug and Cosmetic Act of 1938. It is therefore found that the plaintiff has been and is acting in good faith in preparing and using these pamphlets.

13. After the plaintiff's rewriting of the pamphlet, and its publication in January, 1948, plaintiff learned that agents of the Food and Drug Administration were interrogating some of plaintiff's distributors and customers. In order to determine the basis for such interrogations, plaintiff arranged a meeting with representatives of the Food and Drug Administration at the Administration's office in Los Angeles. Plaintiff stated to the Chief of said Administration's office that it wished to comply with every phase of the Food, Drug and Cosmetic Act and asked whether the investigation and interrogations were prompted by a belief that any part of plaintiff's label or labeling in any way violated any provision of said Act. The said Chief advised plaintiff that the investigation and interrogations were merely routine in nature and said Chief made no statement implying or suggesting that the Food and Drug Administration had any objection to the pamphlet "How to Get Well and Stay Well".

Plaintiff further stated to said Chief that should any question arise any time in the future concerning the alleged violation of said Act (misbranding) by any product distributed by plaintiff or in con-

nection with any phase of plaintiff's business or operations, that if the Food and Drug Administration would notify the plaintiff thereof immediately when such question arose, plaintiff would do its utmost to comply with the views of the Food and Drug Administration.

14. On September 15, 1948, a secret indictment was returned in Los Angeles against the plaintiff's two principal stockholders, Lee S. Mytinger and William S. Casselberry, based upon allegations of misbranding of Nutrilite by the edition of the pamphlet "How to Get Well and Stay Well" obtained by defendants on December 5, 1946, products shipped by plaintiffs on January 3, 1947 and February 26, 1947, and which were involved in the notice and hearing thereon in July, 1947. The Federal Judge to whom this indictment was assigned for trial has advised the parties that he considers the trial a waste of Government money due to the discontinuance of the labeling there questioned. This indictment has not yet been set for trial.

15. On October 6, 1948, without prior notice to plaintiffs, the defendants instituted or caused to be instituted and commenced a libel action under which some packages of Nutrilite and some copies of the 58-page pamphlet "How to Get Well and Stay Well" were seized in Belleville, New Jersey. Said libel alleged the misbranding of Nutrilite through the use of pages 37 through 58 of the 58-page edition of said pamphlet.

16. On September 28, 1948, defendant Crawford had authorized said seizure action of October 6, 1948, in Belleville, New Jersey, without reading pages 1 through 36 of this 58-page pamphlet. A reading of pages 1 through 36 of this pamphlet is hereby found to be essential in fairly interpreting pages 37 through 58.

17. On September 30, 1948 defendant Crawford authorized multiple seizures of Nutrilite in an *ex parte* secret decision holding the 58-page pamphlet

would be and is misleading in a material respect to the injury or damage of the purchaser or consumer. This decision was made without reading all of the 58-page pamphlet or re-reading pages 37-58, and it is admitted that defendant Crawford had not read all of the 58-page pamphlet prior to January 28, 1949. When this decision was made he had before him no facts showing injury or damage by Nutrilite or the 58-page pamphlet to any purchaser or consumer of Nutrilite and no facts showing that any user, purchaser or consumer of Nutrilite had made any complaint against the product or the 58-page pamphlet. No notice or copy of this decision was given or disclosed to plaintiff and plaintiff's first knowledge of its existence and contents came on January 17, 1949, when defendants filed a copy thereof in this Court.

Defendant Crawford is not a nutritional expert but claimed he had before him this time (but not on September 28), and relied upon, a so-called finding of fact in writing which purported to be signed by a Dr. Robert C. Butz, an employe of the Food and Drug Administration, and which was dated September 30, 1948. Dr. Butz was not an employe of the Food and Drug Administration at the time of the trial of this cause.

18. (a) Defendants' actions in initiating and carrying out the multiple seizures of Nutrilite are primarily attributed by them to certain findings of fact on plaintiff's pamphlets entitled "How to Get Well and Stay Well" purportedly by Dr. Robert C. Butz, then an employe of the Food and Drug Administration. The defendants who had made said decisions each testified that they had not discussed said findings with Dr. Butz. These findings were offered in evidence by defendants and received for the limited purpose of proving their existence as a part of the decision made by defendant Crawford and the decisions referred to herein as having been made by defendants Larrick, Dunbar and Mr. Kingsley, in holding said pamphlets to be misleading, and not as proof of the facts contained in said

findings. Dr. Butz was not produced as a witness and no evidence was offered that he actually and personally made the findings or that he based them upon plaintiff's product or pamphlets.

(b) The defendants admitted in open Court that they had not contacted Dr. Butz to see if he was available to them as a witness, offered no proof of his unavailability as a witness, and in fact stated defendants *would not* make any effort to obtain him as a witness. After specifically warning Counsel for defendants that these circumstances would cause the Court to draw an unfavorable inference against defendants on the qualifications of Dr. Butz, and defendants' right to rely upon him, the Court admitted into evidence a deposition given by Dr. Butz as an adverse witness, under subpoena, of the plaintiff.

(c) In the deposition he repudiated some of the statements in said findings. The deposition indicated he consulted four medical doctors of the Food and Drug Administration on vitamins and minerals in general, but not on Nutrilite in particular. He had seen no assay or analysis of the contents of Nutrilite. He did not read the 58-page pamphlet in connection with the finding of September 30, 1948, but *relied upon excerpts therefrom.* He did not connect or identify the statements in his findings with any representations in the 58, 36 or 42-page pamphlet.

(d) The four medical doctors employed by the Food and Drug Administration whom Dr. Butz named as his consultants did not testify herein. Defendants have never conducted any experiments to determine the effect of Nutrilite upon deficiency diseases or any other ailment.

(e) From the facts herein, the Court finds that the defendants Crawford, Larrick, Dunbar and Mr. Kingsley, when they made their respective decisions described herein acted arbitrarily, capriciously and unreasonably in placing reliance upon

any of the so-called findings of Dr. Butz, the circumstances under which the findings were prepared, the contents thereof, the knowledge of those making decisions on plaintiff's said pamphlets, their actual reliance upon Dr. Butz, and the other actions of defendants herein which are claimed to be connected with the purported findings of Dr. Butz. It is further found that defendants' failure to produce or to try to produce Dr. Butz as a witness raises an inference that if he had testified in person his testimony would have been adverse to defendants.

19. On October 11, 1948, plaintiff received a copy of the libel papers filed in the Belleville, New Jersey, case on October 6, 1948, and learned therefrom for the first time that defendants were objecting to pages 37 through 58 of the 58-page pamphlet. Plaintiff immediately, on the same day, sent telegrams to all of its top agents throughout the United States instructing them in part as follows:

> "Inform all agents and distributors in your group immediately that pending court ruling pages 37 through 58 inclusive of customer book . . . must not be used in selling Nutrilite. Remove pages 37 to 58 by cutting along fold with sharp knife. Wrap, seal and place disputed material in third party's hands to be held pending final ruling. Books . . . in hands of prospects, junior distributors and customers to be treated in same way. Full explanation will appear with Nutrilite News, but follow above instructions at once."

A bulletin containing a full explanation was then mailed directly to all of plaintiff's agents and distributors to insure that every salesman in plaintiff's organization would get the information on discontinuance of use of pages 37-58 and would follow instructions. This explanation stated that regardless of whether the Food and Drug Administration

is right or wrong, the plaintiff wanted to follow that Administration's views.

20. On October 12, 1948, the plaintiff's attorney advised the Food and Drug Administration in Washington, D. C., by letter, that use of pages 37 through 58 of the 58-page pamphlet had been ordered to be discontinued by all of plaintiff's agents and distributors by said telegram and said bulletin immediately upon receipt of said libel papers. He also advised:

> "In this connection I want to say that the filing of this libel in New Jersey was the first intimation that we had received that any of the literature we are using at present was objectionable to your office. In the future I will appreciate it if you will advise me if you find anything in our literature that you take exceptions to. Mytinger and Casselberry are a reputable firm, and are desirous of co-operating with your Agency in every way possible. I need not point out that the offense of 'misbranding' is not a well defined one in the light of present day scientific knowledge, and it is very easy for a firm in the nutritional supplement field to make statements in the best of faith which do not 'square' with the views of your office. In this case a letter from your Agency pointing out your objections would bring a correction without the necessity of court action.
>
> * * * * * *
>
> "With mutual cooperation, I believe that much trouble and expense can be saved for all parties concerned."

This letter and the facts set forth in paragraph 19 hereof show plaintiff was, in good faith, trying to comply with defendants' interpretations of the Food, Drug and Cosmetic Act of 1938.

21. On October 19, 1948, after failing to answer this said letter of October 12, 1948, the defendants made a second similar seizure in New York City.

22. The libel papers in this said second seizure action and the libel papers in the eight additional seizure actions described hereinafter contain statements which are in substance identical. There are no separate issues of fact or law necessitating more than one such action, as a decision in the first libel action would settle all said issues with respect to the alleged misbranding of Nutrilite by the use of the three editions of the pamphlet "How to Get Well and Stay Well." These libel seizure actions having been instituted in widely separated jurisdictions in the United States inflicted unnecessary punishment and expense on the plaintiff.

23. The October 19, 1948 seizure and the ten other seizures hereinafter found to have been made and instituted against plaintiff's product Nutrilite, were made under the provisions of Section 334(a) of Title 21 of the United States Code which permits multiple libel seizure actions based upon the same alleged misbranding "when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employe of the agency . . . that the labeling of the misbranded article . . . would be in a material respect misleading to the injury or damage of the purchaser or consumer."

24. On approximately October 18, 1948, plaintiff agreed to the request of the Government that the indictment matter in California be continued to December 5, 1948, upon plaintiff's understanding that the defendants contemplated making no more seizures. However, other seizures were made thereafter.

25. On October 28, 1948, the third said similar seizure was made in Buffalo, New York.

26. In November, 1948, plaintiff requested defendants to agree to consolidation and trial in the United States District Court in Los Angeles, within 25 miles of plaintiff's principal place of business in Long Beach, of the said three libel seizures which

had then been filed. Defendants refused said request and informed plaintiff that they would agree to consolidation for trial of the three cases in Phoenix, Arizona, or in San Francisco, California, only. Defendants at the same time advised the plaintiff that they had already approved further seizures and did not promise to withhold said seizures if the first three were consolidated for trial.

27. After plaintiff and its agents and distributors had removed the pages objected to in the first libel action, the remaining 36 pages of the 58-page edition of "How to Get Well and Stay Well" were used for a short period while an epilogue was being written to complete said booklet. This 36-page edition is identical with the first 36 pages of the 58-page edition of said pamphlet which Defendant Crawford had before him in making his decision of September 30, 1948. Subsequently, 6 pages were added to the said 36-page booklet which did not alter or enlarge the sense and meaning of the first 36 pages. The addition of these pages resulted in the so-called 42-page edition of "How to Get Well and Stay Well" which has been used by plaintiff since approximately December 1, 1948.

28. On December 1, 1948, the fourth said similar seizure was made in Hastings, Nebraska.

29. On December 2, 1948, the defendant Larrick made an *ex parte* decision holding that the 36-page edition of the pamphlet "How to Get Well and Stay Well" would be and is misleading in a material respect to the injury or damage of the purchaser or consumer. Defendant Larrick at the time of his December 2, 1948 decision, knew that defendant Crawford, in his decision of September 30, 1948, had these 36 pages before him and that defendant Crawford had not found these 36 pages to be objectionable and that said 36 pages of the said 58-page pamphlet were identical with the 36-page pamphlet before him. He knew of the communication from plaintiff's attorney requesting

an opportunity to comply with future objections, as described in paragraph 13 hereof. He had no facts before him at the time of his decision showing that Nutrilite or any of its labeling, including the 36-page pamphlet, had damaged or injured any purchaser or consumer. He is not a nutritional expert and claimed that he relied on a so-called finding of fact purportedly made by Dr. Robert C. Butz, referred to in paragraph 18 hereof and "accepted Dr. Butz' conclusions as to the misleading character of the statements in it". Said decision of defendant Larrick was not disclosed to plaintiff until Jan. 17, 1949, when a copy thereof was filed in the instant case. The findings in said paragraph 18 as to Dr. Butz and defendant Larrick apply here.

30. On December 9, 1948, defendant Dunbar made an *ex parte* decision holding that the 42-page edition of plaintiff's pamphlet "How to Get Well and Stay Well" would be and is misleading in a material respect to the injury or damage of the purchaser or consumer. This matter was brought to him for decision by a Mr. Murray, an employe of the Food and Drug Administration and author of a memorandum indicating that the defendants planned to "keep the pressure" on plaintiff. Mr. Murray informed defendant Dunbar that he (Murray) was considering a number of seizure recommendations against Nutrilite based on the labeling contained in the 42-page pamphlet. Defendant Dunbar read only certain unidentified parts of the pamphlet pointed out to him by Mr. Murray before making his decision that the pamphlet was misleading and relied on oral statements made to him by Mr. Murray. He had before him at the time of his decision no facts showing damage or injury to any purchaser or consumer by Nutrilite or any of plaintiff's labeling, and had not seen nor heard of any complaints that Nutrilite or its labeling had injured or damaged any person. He did not consider the report on the defendants' own survey to determine how purchasers and consumers

interpreted this pamphlet, although it was then in his files. He, too, testified that he was not a nutritional expert but claimed he relied upon a finding of fact purportedly made by Dr. Butz and the findings in paragraph 18 hereof on Dr. Butz and defendant Dunbar apply here. This decision of defendant Dunbar was not disclosed to plaintiff until January 17, 1949, when a copy thereof was filed in the instant case.

31. Through the actions of defendants, additional similar seizures of Nutrilite and said pamphlets were then made in the following places:

Belleville, New Jersey	December 15, 1948
Spokane, Washington	December 23, 1948
Seattle, Washington	December 30, 1948
Clarkfield, Minnesota	December 31, 1948
St. Petersburg, Florida	January 4, 1949
Chicago, Illinois	January 3 & 4, 1949

Finding 22 hereof covers the similarity of issues in these cases. These seizures were made after defendants had made a survey to determine whether plaintiff's said pamphlets were misleading in any particular to consumers and purchasers thereof under customary conditions of purchase and use and after said survey had revealed that said pamphlets were not in fact misleading in any particular to purchasers and consumers.

32. (a) On December 30, 1948, the instant injunction action was filed. At this time it was the intention and plan of the defendants to file many more libel seizure actions and seize Nutrilite throughout the Nation. The Food and Drug inspectors knew of this general policy.

(b) It was the plan of defendants to keep a sustained pressure against plaintiff through such seizures until an injunction was granted in the instant action or the indictment case in California based upon the discontinued literature went to trial. This plan of defendants is set forth in writing in a memorandum written by A. G. Murray, an

administrative officer of the Food and Drug Administration, and addressed to the Division of Field Operations of the Food and Drug Administration. It was not denied that Mr. Murray was and is under the control of the defendants and that he was present in Court. No effort was made by the defendants to call Mr. Murray and explain the circumstances under which the memorandum was written and used. Defendant Larrick admitted that said memorandum was an accurate statement of defendants' policy in regard to plaintiff, and that said memorandum was circularized in the offices of the Food and Drug Administration and created a general impression in said offices highly prejudicial to plaintiff. The Court presumes, from defendants' refusal to call Mr. Murray as a witness, that his testimony, not only in regard to the contents and use of said memorandum, but also in regard to the seizure recommendations presented to defendant Dunbar by him, would have been adverse to the defendants.

(e) Defendants made no effort to secure an early trial in the libel cases and in order to effect seizures more quickly, mimeographed copies of the booklets "How to Get Well and Stay Well" were prepared for transmission to United States Attorneys.

33. On January 17, 1949, defendants filed in the United States District Court for the District of Columbia a motion to dismiss the complaint herein.

34. On January 24, 1949, Judge David A. Pine of the United States District Court for the District of Columbia found that the actions of the defendants in rendering said decisions were "unfair", "drastic", "shocking", and "harsh" and held that the decisions of defendants Crawford, Larrick and Dunbar, described *supra*, were unlawful because the Administrator of the Federal Security Agency did not have the authority to delegate this power to make such decisions to said defendants.

35. (a) On January 28, 1949, at the request of defendant Dunbar, the Acting Administrator of

the Federal Security Agency, J. Donald Kingsley, made three decisions identical in language with the three decisions of defendants Crawford, Larrick and Dunbar, *supra*, (paragraphs 17, 29 and 30) respectively. He is not a nutritional expert but claimed he relied upon three so-called findings purportedly made by Dr. Robert C. Butz.

(b) Kingsley did not talk to Dr. Butz or identify the Butz findings contained in defendants' Ex. No. 23 as those upon which he (Kingsley) relied in connection with any particular one of his three decisions. He is uncertain as to which version or versions of the pamphlet he had before him, and did not read all three pamphlets before making his decision condemning all three as misleading in a material respect to the injury or damage of the purchaser or consumer. Kingsley did not consider the defendants' own investigation and report thereon in his files showing that consumers and purchasers did not receive a misleading impression from reading plaintiff's pamphlets.

(c) Kingsley had no facts before him showing injury or damage to any purchaser or consumer of Nutrilite by the product or its labeling, and had no facts before him showing any complaints of injury or damage from Nutrilite or its labeling.

(d) Kingsley, as Acting Administrator of the Federal Security Agency, twice refused requests of plaintiff that he grant it a hearing prior to making a decision on whether Nutrilite was misbranded by said labeling, the three editions of the pamphlet "How to Get Well and Stay Well". Said requests advised him that if officials of the Food and Drug Administration asked him to make a decision that plaintiff's advertising and labeling were misleading in a material respect to the injury or damage of the purchasers or consumers of Nutrilite, plaintiff could present him with the full and true facts showing that the labeling of Nutrilite was not misleading in any respect. He was advised by plaintiff that the consequences of an erroneous decision on

this matter by him would be that plaintiff would be put out of business completely and irreparably damaged by the multiple seizures so authorized and threatened by defendants prior to any possible opportunity plaintiff might have to defend itself against said decision. He twice denied this request for a hearing prior to his decisions, talked only to his own counsel and to defendants Dunbar and Crawford about the decision of Judge Pine, and made an *ex parte* decision that plaintiff's labeling is misleading. The findings in paragraph 18 hereof on Dr. Butz and Mr. Kingsley apply here.

(e) Defendants did not produce Kingsley as a witness or prove that he was unavailable to them as a witness, and his deposition is incomplete. Counsel states therein that the deposition is to be completed at a later date when certain records, which defendants refused to produce at the time of the taking of the deposition, were made available under Court order. The order was made but the deposition was not completed. Defendants' failure to produce Kingsley as a witness, or to prove his unavailability to them as a witness, warrants an inference that if he had testified his testimony would have been adverse to defendants.

36. On March 3, 1948, Judge David A. Pine granted a motion to dismiss plaintiff's complaint with leave to amend and the Amended Complaint, which is before this Special Three-Judge Court, was then filed. A temporary restraining order was then signed enjoining defendants from making any further seizures of Nutrilite *pendente lite*.

37. On April 5, 1949, plaintiff filed a motion in the Federal District Court in Newark, New Jersey, to consolidate the ten libel actions for trial in Los Angeles, California, which motion defendants opposed. Said motion was argued on Monday, September 19, 1949, at which time it was the defendants' general position that the defendants did not want the libel issues tried in Federal Court in Los Angeles. Three days later, on Thursday, September 22, 1949, however, the defendants filed an in-

junction action in the very Federal Court in Los Angeles involving identical issues insofar as plaintiff's pamphlet "How to Get Well and Stay Well" is concerned. The defendants' action herein was deliberate and arbitrary to increase the plaintiff's irreparable damage. Defendants knew that plaintiff could consolidate all such actions and that the only accomplishment of the filing of the numerous seizure actions would be the irreparable injuries set forth in finding 39 herein.

38. The defendants have caused embargoes to be instituted and placed on Nutrilite prior to the institution of libel for condemnation proceedings in New York, New Jersey, Washington State, Florida, and various localities in the United States by requests to State and local health authorities, which embargoes naturally frightened agents, distributors and customers of Nutrilite and had very much the same damaging and injurious effect as the seizures. These embargoes obtained in widely scattered jurisdictions of the United States caused maximum and irreparable injury to plaintiff.

39. The seizure actions caused plaintiff a sales loss of some $100,000 per month from the time of the first seizure until the instant action was filed, and the defendants were restrained from making further seizures. The seizures had the effect of frightening plaintiff's agents and distributors, so that they worked less, and some resigned, with the net result of loss of morale among agents and distributors, loss in sales volume and loss of personnel. Unfavorable opinions and injurious information with respect to the labeling of plaintiff's product reached many private individuals and organizations. Publicity about the seizure cases initiated by defendants appeared in newspapers and magazines in a way which did injuriously damage plaintiff and this led to loss of customers. Plaintiff was compelled to hire counsel in the ten libel cases and put up bonds and costs in each case. The value of the Nutrilite seized by defendants in the ten libel

actions is $6,822.17 and the product so seized will be unsaleable if returned to plaintiff. The nature of plaintiff's business makes good-will of the public one of its most valuable assets and the acts of the defendants in the embargoes and seizure actions in widely separated parts of the United States has caused the plaintiffs injury and damage. Defendants admit injury to plaintiff and that there has been a serious impact on plaintiff's rights by their actions, and that there is no provision of law requiring or permitting defendants to reimburse plaintiff for the damages herein found or for the injury or for destruction of its business and good-will by the actions of the defendants, in the event of a determination of said libel actions in favor of plaintiff. The injury and damage to plaintiff which has occurred and which is threatened by defendants is therefore substantial and irreparable.

40. The defendants have never advised plaintiff of the particulars of plaintiff's literature considered to be objectionable by defendants. The defendants have not provided an opportunity to plaintiff whereby such literature could be corrected, revised and amended in a manner which would conform to the views of and be acceptable to the defendants.

41. That plaintiff would have been subjected to many additional seizures of its product throughout the United States in addition to the existing 11 seizures of its product, if not enjoined from so doing, is admitted by defendants. It was a general policy and plan of the defendants to make with all possible speed many seizures of plaintiff's product. Such additional seizures, and the product could be seized by defendants in the hands of more than 5,000 of plaintiff's distributors, would have the effect of destroying plaintiff's business prior to any possible adjudication of the disputed issues on plaintiff's labeling in any of the libel actions already filed or threatened.

42. There was and is no emergency involving injury or damage of any kind to the public or to any purchaser, consumer or user of Nutrilite or in connection with Nutrilite and plaintiff's use of the three pamphlets which constitute defendants' sole objection to Nutrilite's sale. Defendants have not, at any time, indicated or contended that there is an emergency or situation of compelling public necessity with respect to the labeling of plaintiff's product and no such emergency or situation did, in fact, exist at or prior to any of the actions of defendants described herein.

43. The evidence herein on the actions, conduct and course of action of defendants before and after the decisions of Crawford, Larrick, Dunbar and Kingsley described above reveal, as do their decisions and actions in making said decisions, that the defendants in making said decisions acted capriciously, arbitrarily, unreasonably, oppressively and unlawfully.

Conclusions of Law

The Court, upon the basis of the Findings of Fact herein, makes Conclusions of Law as follows:

1. This Court has jurisdiction to hear and determine this case.

2. The following provisions of the Food, Drug and Cosmetic Act of 1938, Section 334, Title 21, United States Code, are unconstitutional under the due process clause of the Fifth Amendment to the Constitution of the United States: " . . . such limitations shall not apply . . . when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employe of the agency that . . . the labeling of the misbranded article . . . would be in a material respect misleading to the injury or damage of the purchaser or consumer." The defendants should be permanently enjoined from enforcing this unconstitutional provision against plaintiff.

3. The provisions just quoted in the second conclusion hereof were intended by the Congress to be and are hereby found to be separable from the remaining provisions of the said Act and said remaining provisions remain in full force and effect.

4. Defendants Crawford, Larrick, Dunbar, Kingsley and Ewing, in instituting multiple libel proceedings against the product Nutrilite Food Supplement without first affording the plaintiff a hearing on the issue of whether there was probable cause to believe that the labeling of the product was misleading in a material respect, acted arbitrarily, oppressively, and capriciously in violation of the Fifth Amendment to the Constitution.

5. The defendants and all persons acting in concert with them or under their direction, supervision, or control, should be permanently enjoined from instituting or maintaining any action or proceeding raising issues of fact or law that Nutrilite Food Supplement is misbranded under the Food, Drug and Cosmetic Act of 1938, by the plaintiff's pamphlets, Exhibits 1, 2 and 3, herein.

BENNETT C. CLARK,
Circuit Judge.
T. ALAN GOLDSBOROUGH,
District Judge.
EDWARD A. TAMM,
District Judge.

The Administrative Determinations and the Libels	8
The Complaint and Pre-Trial Proceedings	11
The Trial	14
The Findings and Conclusions	23
Specification of errors to be urged	25
Summary of argument	30
Argument:	
I. The due process clause does not prevent Congress from authorizing administrative determinations of probable cause, upon which institution of multiple seizure suits is conditioned, to be made without a hearing	35
II. The District Court had no jurisdiction to review the administrative determination of probable cause or to decide whether appellee's labeling was misleading	46
A. Preliminary administrative rulings which are mere prerequisites to the commencement of additional proceedings are not reviewable	47
B. The statute and its history show that the administrative finding of probable cause was not intended to be subject to judicial review	52
1. The history of the pertinent statutory provisions	52
2. No review of the administrative finding of probable cause was intended	58
C. The District Court lacked jurisdiction in equity to review the finding of probable cause	65
1. Multiplicity	67
2. Other injury	72
D. The District court lacked jurisdiction to determine whether appellee's labeling was misleading	74
III. If the District Court had jurisdiction to determine such issues, it should have found that the facts amply support the Administrative determination of probable cause and that appellee's labeling is misleading	76

Argument—Continued

Page

IV. Reversible error was committed by the court below in limiting cross-examination and in ruling on the admission and exclusion of evidence and on appellee's rights to pre-trial discovery 98
1. Curtailment of cross-examination 99
2. Objections at trial to questions propounded in an oral deposition 102
3. Exclusion of official statistics showing causes of death 103
4. Erroneous admission and exclusion of medical writings 104
5. Inconsistent rulings as to testimony of the effect of the booklets upon the public 105
6. Inconsistent rulings as to testimony on medical facts 106
7. Error in allowing discovery of administrative records and interrogation of administrative officials 108

Wigmore, *Evidence*, 3d ed., § 1690 105

In the Supreme Court of the United States

OCTOBER TERM, 1949

No. 568

OSCAR R. EWING, FEDERAL SECURITY ADMINISTRATOR, ET AL., APPELLANTS

v.

MYTINGER & CASSELBERRY, INC., A CALIFORNIA CORPORATION

APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

BRIEF FOR THE APPELLANTS

OPINION BELOW

The district court delivered no written opinion, but made findings of fact and conclusions of law which are reported in 87 F. Supp. 650 (R. 756-771).

JURISDICTION

The final decree of permanent injunction was entered by the United States District Court for the District of Columbia, specially constituted

under 28 U.S.C. 2282 and 2284, on December 14, 1949 (R. 771). The appeal was allowed on January 9, 1950 (R. 773), and this Court noted probable jurisdiction on February 20, 1950 (R. 1565). This Court has jurisdiction under 28 U.S.C. 1253 and 2101(a) to review the judgment and decree by direct appeal.

The judgment and decree (R. 771) permanently enjoin the enforcement, operation, and execution of a part of Section 304(a) of the Federal Food, Drug, and Cosmetic Act, 52 Stat. 1040, 21 U.S.C. 334(a), on the ground that it violates the due process clause of the Fifth Amendment to the Constitution of the United States.

QUESTIONS PRESENTED

Section 304(a) of the Federal Food, Drug, and Cosmetic Act permits multiple libel suits to be filed against a misbranded drug "when the Administrator has probable cause to believe from facts found, without hearing, * * *" that the misbranded article is dangerous to health, or that the labeling of the misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer." The questions presented by this appeal are:

1. Whether this provision violates the due process clause of the Fifth Amendment because it permits the Administrator to find "probable cause" without holding a hearing.

2. Whether the District Court had jurisdiction to review the Administrator's determination of probable cause.

3. Whether the District Court had jurisdiction to decide whether the labeling of appellee's product was misleading.

4. Whether, if the District Court had jurisdiction to determine the issue, the administrative finding of probable cause rested upon a rational basis.

5. Whether, if the District Court had jurisdiction to determine the issue, appellee's labeling was misleading.

6. Whether the District Court committed procedural errors requiring reversal:

(a) in unreasonably curtailing the cross-examination of appellee's witnesses;

(b) in the admission and exclusion of evidence;

(c) in pre-trial rulings that appellee could probe appellants' mental processes and require the production of agency files for its examination without showing "good cause"; and

(d) in ruling that appellee's "good faith" was a material issue.

STATUTE INVOLVED

Section 304 of the Federal Food, Drug, and Cosmetic Act of June 25, 1938, c. 675, 52 Stat. 1040, 21 U.S.C. 334, provides in pertinent part as follows:

> (a) Any article of * * * drug * * * that is * * * misbranded when introduced into

or while in interstate commerce * * * shall be liable to be proceeded against * * * on libel of information and condemned in any district court of the United States within the jurisdiction of which the article is found: *Provided, however,* That no libel for condemnation shall be instituted under this Act, for any alleged misbranding if there is pending in any court a libel for condemnation proceeding under this Act based upon the same alleged misbranding, and not more than one such proceeding shall be instituted if no such proceeding is so pending, except that such limitations shall not apply (1) when such misbranding has been the basis of a prior judgment in favor of the United States, in a criminal, injunction, or libel for condemnation proceeding under this Act, or (2) when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency that the misbranded article is dangerous to health, or that the labeling of the misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer. * * *

(b) The article shall be liable to seizure by process pursuant to the libel, and the procedure in cases under this section shall conform, as nearly as may be, to the procedure in admiralty; except that on demand of either party any issue of fact joined in any such case shall be tried by jury. When libel for condemnation proceedings under this section, involv-

ing the same claimant and the same issues of adulteration or misbranding, are pending in two or more jurisdictions, such pending proceedings, upon application of the claimant seasonably made to the court of one such jurisdiction, shall be consolidated for trial by order of such court, and tried in (1) any district selected by the claimant where one of such proceedings is pending; or (2) a district agreed upon by stipulation between the parties. If no order for consolidation is so made within a reasonable time, the claimant may apply to the court of one such jurisdiction, and such court (after giving the United States Attorney for such district reasonable notice and opportunity to be heard) shall by order, unless good cause to the contrary is shown, specify a district of reasonable proximity to the claimant's principal place of business, in which all such pending proceedings shall be consolidated for trial and tried. Such order of consolidation shall not apply so as to require the removal of any case the date for trial of which has been fixed. The court granting such order shall give prompt notification thereof to the other courts having jurisdiction of the cases covered thereby.

STATEMENT

Mytinger & Casselberry, Inc., appellee herein, is the exclusive national distributor of "Nutrilite Food Supplement", an encapsulated concentrate of alfalfa, watercress, parsley, and synthetic vitamins combined in a package with mineral tablets

(Pl. Ex. 8, R. 725, 740, 55).[1] The drug[2] is not marketed through customary retail channels, but is sold by salesmen who directly solicit consumer contracts (R. 725, 56, 213-214, 315). These salesmen approach prospective customers with a booklet entitled "How to Get Well and Stay Well", which discusses the relation between vitamins, nutrition, and disease. As part of the sales promotion program, this booklet is left with the prospective purchaser on loan for perusal at his leisure. The salesman calls for the booklet a few days later and undertakes to obtain a contract for delivery of a year's supply of Nutrilite (one box each month) costing approximately $200 a year payable in monthly installments. (R. 315.)

The booklet has been through several revisions, each precipitated by regulatory action on the part of the Food and Drug Administration. An early version (Deft. Ex. 7, R. 1104, 298), in use until May 1948, was the basis for an indictment returned in the Southern District of California charging Lee S. Mytinger and William S. Casselberry, as partners, with deliberately misrepresenting the therapeutic value of Nutrilite, in violation of the Federal Food, Drug, and Cosmetic

[1] Plaintiff's Ex. 8, a box and label of Nutrilite, is on file with the Clerk of this Court.

[2] Although under the statutory definition appellee's product is a drug (Section 201(g), 21 U.S.C. 321(g)), appellee prefers to characterize it as a food. The difference is immaterial, inasmuch as the applicable statutory provisions are identical. Sections 403(a), 502(a), 304, 21 U.S.C. 343(a), 352(a) and 334.

Act.[3] (R. 729, 751). In this version the booklet represented, without qualification, that Nutrilite is an effective therapeutic agent in "almost every case" and is a cure of "common ailments" (R. 1155), which were specifically listed[4] as "low blood pressure, ulcers, mental depression, pyorrhea, muscular twitching, rickets, worry over small things, tonsilitis, hay fever, sensitiveness to noise, underweight, easily tired, gas in stomach, cuts heal slowly, faulty vision, headache, constipation, anemia, boils, lack of ambition, certain bone conditions, nervousness, nosebleed, insomnia (sleeplessness), allergies, asthma, restlessness, bad skin color, poor appetite, biliousness, neuritis, night blindness, migraine, high blood pressure, sinus trouble, lack of concentration, dental caries, irregular heartbeat, flabby tissues, hysterical tendency, eczema, overweight, faulty memory, colitis, craving for sour foods, arthritis (rheumatism), neuralgia, deafness, subject to colds" (R. 1155-1156). At another point (R. 1127), it implied that "cancer, diabetes, heart trouble, high blood pressure, constipation, tuberculosis, arthritis, neuritis" and numerous other

---

[3] This case had not been tried. An injunction suit was also brought against appellee in the Southern District of California on September 22, 1949. Trial of that proceeding has been put off by reason of the pendency of the instant case; in any event, unless the findings in the instant case are set aside by this Court, appellee will assert that they are *res judicata* and dispositive of the injunction proceeding.

[4] The list was omitted in subsequent revisions; for a time a similar list appeared on a card shown to prospective purchasers (Def. Ex. 3, R. 1058, 198).

diseases would respond to Nutrilite treatment.

As a result of governmental action (Pl. Ex. 9, R. 1018, 56, 35, 726-729, 750-751), the partners consulted an attorney who advised that the booklet be revised to eliminate the names of all diseases, and the use instead of descriptions of symptoms manifested by persons who had sought relief through Nutrilite (R. 35, 207-208). The 58-page edition of "How to Get Well and Stay Well", one of those involved in the present case, was the result of such revision (Pl. Ex. 1, R. 783-843, 207-208). The change in technique is readily apparent from a comparison of the two booklets (Deft. Ex. 7, R. 1104-1162D, 298, Pl. Ex. 1, R. 783-843).[5] Pages 37-58 do not make direct curative claims, but include a number of case histories explaining how persons have obtained relief and freedom from various ailments and symptoms of disease listed in the following paragraph (R. 822-843).

The Administrative Determinations and the Libels. On September 28, 1948, appellant Charles W. Crawford, Associate Commissioner of Food and Drugs, recommended that a seizure case be instituted in the United States District Court for

[5] Compare, especially, R. 825-838 with R. 1105-1118, and R. 790 with R. 1138A, and the following statements (R. 818) "Think of our population, and think of all the common ailments," with (R. 1127) "Think of our population, and think of the number of cases of cancer, diabetes, heart trouble, high blood pressure, constipation, tuberculosis, arthritis, neuritis, and so on ad infinitum."

the District of New Jersey against a shipment of "Nutrilite Food Supplement" found in Belleville, New Jersey. Its labeling included a number of copies of the 58-page booklet (R. 188, 332). The seizure was accomplished on October 6, the libel charging that the drug was misbranded when introduced into interstate commerce because of false labeling representations (R. 729, 751).

On September 30, 1948, another seizure recommendation came before Mr. Crawford based upon the same alleged misbranding (R. 333). Attached to the recommendation was a finding of fact in writing signed by Robert C. Butz, M. D., a medical officer of the Food and Drug Administration, stating that "Nutrilite Food Supplement," taken as directed, would not be effective in the treatment of "low vitality, over-fatigue, insomnia, poor appetite, gastro-intestinal distress, recurrent vague aches and pains, weak eyes, defective teeth, nervousness, heart disease, stomach pains, disease conditions requiring surgery, feeble-mindedness, diabetes, hemorrhage connected with the menopause, indigestion, sneezing, weeping, anemia, leukemia, sinus trouble, constipation, tuberculosis, headache, dizziness, vomiting, and all deficiency diseases" (Deft. Ex. 13, R. 1173-1174, 333, 334). With this medical finding before him, Mr. Crawford reexamined the booklet to determine whether the booklet represented Nutrilite to prospective purchasers as an effective treatment for those symptoms and

conditions (R. 334, 384). He concluded that there was probable cause to believe, and that he did believe, that the labeling of the drug would be in a material respect misleading to the injury or damage of the purchaser or consumer (Deft. Ex. 13, R. 1173, 333). This determination of probable cause was made as required under Section 304(a), *supra*, and thereafter three additional libel suits based upon the same alleged misbranding were recommended by the Federal Security Agency and were filed by the appropriate United States Attorneys (R. 729, 751).

Appellee then abandoned pages 37-58, ordered its salesmen to delete them from all booklets, and continued its sales campaign with the resulting 36-page version (Pl. Ex. 2, R. 844-882, 272, Pl. Ex. 11, R. 1024A, 273, 59-60, 188). On December 2, 1948, appellant George P. Larrick, Assistant Commissioner of Food and Drugs, made a probable cause determination on this booklet in circumstances substantially similar to those in which Mr. Crawford had acted. (Deft. Ex. 15, R. 1216, 408, 389, 395). The only difference was that the statements charged to be false and misleading were drawn from the first 36 pages of the booklet, the particular portions considered offensive being set forth in an exhibit attached to the finding of fact.[6] One additional libel

[6] This exhibit, although offered in evidence by appellants, was not admitted by the district court (R. 392, 408). The exhibit as offered is printed at R. 1218-1223.

suit was recommended by the Agency, and was consummated on December 15, 1948 (R. 408, 729, 751).

Shortly thereafter, representatives of the Food and Drug Administration in the field encountered a further revision of the booklet, this one 42 pages long (Pl. Ex. 3, R. 883-927, 272, 315, 188-189, 205). A seizure recommendation came before appellant Dr. Paul B. Dunbar, Commissioner of Food and Drugs, on December 9, 1948 (R. 311-315). Dr. Dunbar was presented with a medical finding of fact that the drug, taken as directed, would not be effective in preventing or treating most common diseases (R. 1171-1172), and was given the 42-page booklet for his examination (R. 313-315). He concluded, after examining the booklet, that it seriously misbranded the drug by exaggerating its effectiveness in the prevention and treatment of "most common diseases", and he accordingly made his probable cause determination (Deft. Ex. 12, R. 1171-1172, 314, 315). Five seizure cases were filed on the basis of this finding (R. 729, 751).

The Complaint and Pre-Trial Proceedings. The present suit was filed in the United States District Court for the District of Columbia, on December 30, 1948, seeking to enjoin the prosecution of all of the libel suits except the one first filed and to prevent the filing of additional libel suits. No issue of constitutionality was raised (R. 689). On January 24, 1949, at a hearing on appellants' motion to dismiss the complaint on the ground that it

failed to state a claim upon which relief could be granted, Judge Pine questioned the authority of appellants Crawford, Larrick, and Dunbar to act on behalf of the Federal Security Administrator in making the determinations of probable cause. (R. 593-4). However, he gave appellants an opportunity to present the matter to the Federal Security Administrator, and on January 28, Acting Administrator J. Donald Kingsley made the same probable cause determinations (Deft. Ex. 23, R. 1532-41, 518, 503). On March 4, Judge Pine granted the motion to dismiss the complaint (R. 724), with leave to amend to attack the constitutionality of Section 304(a) of the Act. (R. 608-609).

On that day, an amended complaint alleging substantially the same facts as were alleged in the original complaint but adding allegations of unconstitutionality, was filed (R. 725). Section 304(a) of the Act was alleged to be repugnant to the due process clause because it failed to afford appellee an opportunity for a hearing prior to the determination of probable cause (R. 733). Appellee prayed that appellants be ordered to dismiss all libel cases except the one first instituted; that the multiple seizure provisions of Section 304(a) be held invalid; and that a three-judge court be convened (R. 736). Judge Tamm granted a temporary restraining order on March 4, 1949 (R. 739). After a hearing on appellants' motion to dismiss, the three-judge court granted a temporary

injunction on April 6, 1949, without hearing evidence and without making findings of fact or conclusions of law (R. 741-742).

On April 14 notices to take depositions were served on Federal Security Administrator Ewing,[7] Assistant Administrator Kingsley, Commissioner Dunbar, Assistant Commissioner Larrick, and three subordinate officials of the Food and Drug Administration in the Los Angeles area. The notices were followed by the service of *subpoenas duces tecum* which called for production of all records of the Agency relating to Mytinger & Casselberry, Inc., Lee S. Mytinger, William S. Casselberry, Nutrilite Products, Inc., Carl F. Rehnborg, and "Nutrilite Food Supplement." (R. 743-745.) Appellants moved to quash the subpoenas on numerous grounds (R. 746). A hearing was held before Judge Clark, who overruled appellants' objections (R. 747-748).

A pre-trial conference was held before Judge Tamm on April 13, 1949 (R. 643). Thereafter, a petition for writs of prohibition and/or mandamus was filed in this Court on the ground that the District Court proposed action in excess of its jurisdiction in undertaking a trial *de novo* on the issue whether the labeling was materially misleading. The petition was denied on May 16, 1949. 337 U.S. 902.

---

[7] Mr. Ewing was absent from duty because of illness. Upon assurance from counsel that Mr. Ewing had not participated in the administrative decisions, he was excused from interrogation.

The Trial. The trial began before Judges Clark, Goldsborough, and Tamm on October 17 and was completed on October 27. Aside from reading into the record portions of the appellants' answer, admissions made under Rule 36 of the Federal Rules of Civil Procedure, and several memoranda taken from the files of the Food and Drug Administration (R. 58-59, 70, 273-283, 28, 48-49, 61, Pl. Ex. 4, R. 929-939, 47, Pl. Ex. 16, R. 1030 A, 69, 38-47, 64-65, 67-68, 269-271), appellee's case consisted of the testimony of William S. Casselberry, its president, and Dr. John A. Myers, and a deposition of Lee J. Myers, an attorney.[8] In substance, their testimony was that appellee had acted in good faith in making the statements contained in the booklets; that, in their opinion, there was nothing in the booklets that was false or misleading; and that the statements contained therein conformed to the consensus of medical opinion. (R. 35-38, 50-53, 57-65, 75, 85, 86, 257-258.)

The three editions of the booklets were introduced into evidence. (Pl. Ex. 1, 2 and 3, R. 783-927, 272). The contents of the booklets are analyzed in Point III, *infra*, pp. 82-95.

---

[8] The only other testimony, the deposition of Roger W. Truesdail, read into the record by appellee, declared that there would be a gradual loss of certain vitamin factors in multiple vitamin products with prolonged storage, and that there would be a loss of potency over the period of a year (R. 285). See p. 73, *infra*.

Cross-examination of Casselberry on specified passages in the booklet was not permitted (R. 230-233). At the court's suggestion, the questions ruled objectionable were embodied in a written "offer of proof" (R. 232-233), but when this offer of proof was presented, the court held that it was improper under rules "universal in every court in the United States", and rejected it (R. 520-528). After this ruling, the court also refused to permit the recall of Casselberry, who was present in the courtroom (R. 527-528).

Dr. Myers testified on direct examination that many common symptoms, such as headaches, gastric distress, lack of pep, fatigue, etc., reveal that widespread sub-clinical dietary deficiency diseases exist in the United States (R. 74-84, 86, 95, 145-147, 148), and that the vitamins and minerals in Nutrilite would be "helpful" for the symptoms mentioned in the booklet, though not necessarily sufficient to eradicate them completely (R. 86). On cross-examination, however, he testified that he understood the terms "common illnesses," "common diseases", "common deficiency diseases that cause death in the 40s and 50s," and "common dietary deficiency diseases", as used in the booklets (See R. 116-118), to include peptic ulcers, colds, sinusitis, colitis, eye trouble, diseases of cardio-vascular origin, arthritis, pneumonia, cancer, tuberculosis, nephritis, diabetes, etc. (R. 95, 97, 98, 100-115, 118, 121-122, 128, 135, 136, 138, 139);

and he admitted that in each of these "common illnesses" and "common diseases" vitamin pills alone would not cure or help (R. 99-102, 106-107, 112, 127-128, 131-132, 148, 163).

The court stated, on several occasions during the course of the trial, that the booklets, as the court read them, represented only that the product would tend, by contributing to better general health, to increase the body's ability to withstand the inroads of disease, and thus in that sense to act as a preventative and not as a cure (R. 115-118, 122-127, 149-150, and see Finding 12(e) and (f), R. 759-760). For that reason, Judge Clark admonished counsel for appellants that the cross-examination had "gone far afield" (R. 115-116, 148) and cross-examination on Dr. Myers' understanding of various statements in the booklets was cut off (R. 181-183). Cross-examination as to the truth or falsity of claims drawn from testimonial letters found in pages 37-58 of the 58-page booklet was not permitted on the ground that counsel should not "twist" a testimonial into a representation of general applicability (R. 151-152), and that whatever possible misrepresentations there might be in the testimonials if they stood alone were fully explained in the first part of the booklet (R. 149-150).

At the conclusion of the appellee's case, the appellants moved for dismissal, urging that the evidence showed at most only that the booklets were not false or misleading to Casselberry, Mr. Myers

and Dr. Myers, and that this did not establish that the determinations of probable cause had no rational basis. The motion to dismiss was denied (R. 287-295).

The evidence offered by appellants fell into two categories: (1) testimony of the administrative officials concerned to show the basis for their determinations of probable cause; (2) testimony of three physicians not connected with the Government, and a Government expert on vitamins, and the deposition of Dr. Butz as to the medical facts on which the administrative officials based their determinations of probable cause.

Acting Administrator Kingsley's deposition, which had been taken by appellee, was read into the record by appellants (R. 501-518),[9] and received in evidence (Deft. Ex. 22, R. 518). There were also received in evidence certified copies of the three determinations of probable cause made by Mr. Kingsley together with the supporting medical findings of fact of Dr. Butz. (Deft. Ex. 23, R. 1532, 518.) Mr. Kingsley's deposition stated that he had examined the editions of "How to Get Well and Stay Well" upon which his determinations were based, that he was an expert on standard propaganda technique, and that the total effect of the pamphlet, as well as of almost every page, was

[9] A part of this deposition was read into the record by appellees (R. 269-270). Appellants exercised their right to read the remainder under Rule 26(d)(4) of the Rules of Civil Procedure for the United States District Courts.

misleading (R. 509-510, 512). He testified that "My decision was based upon the total impression of the publication rather than upon a particular sentence or paragraph. It employs a standard propaganda technique, first of all, of rousing strong emotion, which in this case, is fear, it seems to me, and then following through with the various kinds of suggestions. The whole thing seems to me to be very carefully calculated to produce a misleading impression" (R. 509), and that "the total impression [of the pamphlet] is a product of a substantial number of specifically misleading statements or impressions" (R. 510).

Appellants Crawford, Larrick, and Dunbar testified as experts with long experience in construing labeling and its impact on the consumer, and explained in detail how they had reached their conclusions that the pamphlets were materially misleading. Mr. Crawford testified that he had been with the Food and Drug Administration since 1917, that since 1918 one of his functions has been to review labeling and to evaluate the representations made to the public generally (R. 331-332), and that "this booklet [the 58-page version] fell into a very familiar pattern. It wins the reader's confidence right at the beginning by making statements of fact that everybody knows, and by professions of honesty and good will toward mankind, and then starts playing upon the scare technique, on persuading the reader that something is wrong with him.

* * * It creates an aura of honesty, an aura of good faith, for implications, innuendoes, inferences, that I believed when I read the book first—and believe now—are highly misleading, and are likely to be of great damage to consumers who are persuaded by this book or this material, and rely upon it for the purposes for which it is held forth in this book" (R. 334-336).

Mr. Crawford testified that the testimonials contained in the 58-page booklet would be accepted by the reader as representations that Nutrilite would be an efficacious treatment for the conditions, symptoms and diseases described therein (R. 336, 374-376). The court refused, however, to hear all of his testimony, because in the court's view, each testimonial merely represented the experience of one person and could be shown to be untrue only by proof that the testimonial giver had had no such experience (R. 376, 378-383). The court ruled, as a matter of law, that the testimonials were not intended to be, and could not be considered to be, general representations as to the beneficial effects of Nutrilite for the conditions mentioned therein (R. 152, 378-383).

Appellants Larrick and Dunbar testified similarly as to their lengthy service with the Food and Drug Administration and experience with labels and their effect on the consumer (R. 308-310, 385-387), that their opinions as to the representations made in the 36-page and 42-page booklets were simi-

lar to that of Mr. Crawford's with respect to the 58-page booklet, and that the booklets led readers to believe that Nutrilite offers an effective means of preventing and curing common and serious diseases such as ailments involving the heart and arteries, high blood pressure, coronary diseases, pneumonia, tuberculosis, and cancer (R. 326-327, 396, 398-400). Dr. Dunbar, Commissioner of Food and Drugs, testified that he had been with the Food and Drug Administration since 1907, that he had extensive experience in determining whether labels are misleading, and that "In making that survey of labels, it is always my effort to place myself in the position of the individual who is going to read that label and attempt to determine what impression the labeling will make on the person—the customer or purchaser—who reads that label" (R. 308, 310-311). He went through the 42-page booklet *seriatim*, and testified in detail as to the misleading statements contained in, and impressions conveyed, by, the booklet (R. 315-326). He stated that (R. 316-317):

> A scare technique was being followed in the early part of this booklet to impress the prospective purchasers with the idea that almost everyone they met—members of their family, their friends, and they themselves—were afflicted with something or other that needed treatment or something terrible would happen.
>
> It is quite a favored technique with those who in times past—and even to this day—are

> selling various types of worthless patent medicines. It is very adroitly worded. There is a vast amount of factual statement in here, so I felt, that would create a fear complex in the mind of the purchaser.
>
> I read the first six pages most carefully to determine whether that impression was carried out through the initial paragraphs of the book; then turned back and found further on that this product eventually is offered as the salvation of the individual who fears that he is afflicted with some of these diseases, or may be afflicted with those diseases.

These officials testified that, having drawn the conclusion that the booklets offered Nutrilite as a cure for common diseases and for a large number of symptoms, and being advised by medical findings of fact that the drug would not be effective in preventing or treating most common diseases or in treating the many symptoms and conditions expressly mentioned in the booklets, they had concluded that they had probable cause to believe that the labeling would be in a material respect misleading to the injury or damage of the purchaser or consumer (Deft. Ex. 12, R. 1171, 314; Deft. Ex. 13, R. 1173, 333; Deft. Ex. 15, R. 1216, 392, 408; Deft. Ex. 23, R. 1532, 518). To be sure, these witnesses did not have before them when the determinations of probable cause were made, facts showing actual physical injury or damage to any particular purchaser or consumer (R. 330, 385, 406, 507); but

each testified that his determination as to probable injury or damage to purchasers or consumers was based upon his conclusion that the labeling exaggerated the therapeutic value of the drug and that there was probable cause to believe that this labeling would cause consumers and purchasers in most cases to rely upon "Nutrilite Food Supplement" in treating conditions for which it was ineffective (R. 315-319, 335-336, 376-378, 395-405, 509-510). It was also testified that, in some cases, the labeling would cause them to delay in obtaining competent diagnosis and treatment for serious disease conditions with consequent irreparable damage to their health (R. 318, 403-404).

The appellants also presented medical and scientific testimony that vitamin and mineral deficiency diseases in this country today are rare (R. 340-341, 427-431, 442-444), and that a product of the composition of Nutrilite, taken in the recommended dosages and with the frequency prescribed, would not be efficacious for the prevention or cure of the diseases, conditions, and symptoms enumerated by Dr. Butz in his medical findings of fact or for the prevention or cure of so-called "common diseases" (R. 342-343, 344, 348-350, 351, 354-360, 362, 364-365, 432, 434, 437, 472-478).

Documentary evidence was introduced to prove that the booklet misrepresented (1) the significance of dietary disease as one of the causes of rejections among the W.A.C. (Deft. Ex. 4, R. 1059, 234) and

in the Selective Service System (Def't. Ex. 5, 19, 20, R. 1061, 1250, 1391, 465, 1063, 1068-1074, 1086-1099, 1264-1274, 1404-1411); (2) the results of a nutrition survey conducted by the Pennsylvania State College (Def't. Ex. 17, R. 1225, 456-457); (3) the educational background and professional standing of Carl F. Rehnborg (Def't. Ex. 24, R. 1542, 520); and (4) the role of dietary deficiency disease as a cause of death in the United States (Def't. Ex. 25, R. 1543, 529).

The findings and conclusions: The District Court made findings of fact and conclusions of law on December 14, 1949 (R. 756-771), holding that the multiple seizure provision of Section 304(a) under which the appellants had acted was unconstitutional under the due process clause of the Fifth Amendment (Concl. 2, R. 770); that the appellants had acted arbitrarily, oppressively, and capriciously in violation of the Fifth Amendment in instituting multiple libel proceedings without first affording the appellee a hearing on the probable cause question (Concl. 4, R. 770-771); and that the appellants should be permanently enjoined from instituting or maintaining any action raising a claim that Nutrilite is misbranded by the booklet "How to Get Well and Stay Well" (Concl. 5, R. 771).

The court found that the appellants had acted arbitrarily, capriciously and unreasonably in reaching their administrative determinations of probable cause (1) because the pamphlets when read as a whole, without lifting statements out of context,

are not fraudulent, false or misleading in any particular (Findings 12(e) and (f) R. 759-760); (2) because the administrative decisions permitted the institution of suits in widely separated jurisdictions (Finding 22 (R. 763-764)); (3) because appellants had placed reliance upon findings of fact made by Dr. Butz without talking to him about them; (4) because appellants had failed to rely upon a "survey",[10] then in their files, which showed consumer reaction to the pamphlets; (5) because appellants had had before them no evidence of actual injury or damage to purchasers, and (6) because appellants had had insufficient knowledge as to the content of the pamphlets (Findings 17, 18, 29, 30, 31 and 35; R. 761-2, 765-768). The court also made a number of findings as to the appellee's good faith in attempting to comply with the law (Find-

---

[10] The "survey" (Pl. Ex. 4, R. 929-939, 47) was a memorandum from one inspector of the Food and Drug Administration to the effect that he had interviewed seven users of Nutrilite, who did not believe that it was a cure-all but consisted of "vitamins and minerals which would build their bodies up." The memorandum pointed out that "None of these people were the rabid health addicts that one so often comes into contact with in an investigation of this type" (R. 930). Attached to the memorandum were five memoranda of interviews conducted by the inspector, which revealed that the purchasers were not using the drug as a preventative, but were using it for arthritis, anemia, hemorrhaging ulcers, and other serious diseases (R. 931-937). Although the court below treated this report as significant (Fdg. 30, 35(b), R. 765-766, 767), the administrative officials were obviously not bound to regard this statement of the views of seven persons as proof that the public would not be deceived by appellee's representations. In addition the memoranda were hearsay.

ings 8-10, 12-13, 19-20; R. 757-760, 762-763).[11] The court accordingly enjoined the maintenance and prosecution of all seizure actions, including the first instituted (R. 771-772), although the complaint had prayed only that all seizure actions other than the first be enjoined (R. 725, 736).

SPECIFICATION OF ERRORS TO BE URGED

1. The court erred in holding unconstitutional a portion of Section 304(a). (Asgt. 1, pp. 35-46, *infra*).

2. The court erred in holding that it had jurisdiction to review the administrative decisions as

[11] The Court found also that conduct of employees of the Food and Drug Administration before and after the administrative decisions also showed that the decisions were made arbitrarily. (Findings 9, 13-16, 21, 24, 26, 32, 37-42; R. 757-758, 760-761, 763, 764, 766, 768-770). The conduct deemed relevant to show that the decisions were made arbitrarily included: (1) the Food and Drug Administration's failure at all times to specify the exact statements in each pamphlet that were deemed to be false or misleading and to give the Company an opportunity to correct the labeling (Findings 9 and 40); (2) the interrogation of the Company's distributors and customers (Finding 13); (3) the "secret indictment" of Lee S. Mytinger and William S. Casselberry and the institution of the first libel without notice to the Company (Findings 14-16); (4) the failure to answer a letter which advised the defendants of the Company's good faith (Finding 21); (5) the institution of a libel suit contrary to the Company's understanding that no further actions were contemplated (Finding 24); (6) refusal to stipulate for removal of the cases to the Company's home district (Findings 26, 37); (7) placing city and State embargoes at the instance of the Food and Drug Administration (Finding 38); (8) giving unfavorable publicity regarding "Nutrilite" (Finding 39) and the preparation of an inter-office memorandum by an administrative subordinate in the Food and Drug Administration proposing a program for keeping pressure on the Company until there could be a determination on the merits of the controversy (Finding 32).

to whether there was probable cause to believe that the labeling of plaintiff's product would be in a material respect misleading to the injury or damage of purchasers or consumers. (Asgts. 4, 7, pp. 46-74, *infra.*)

3. The court erred in holding that it had jurisdiction to try in a *de novo* proceeding the question whether plaintiff's labeling was false or misleading in any particular or in a material respect to the injury or damage of purchasers or consumers. (Asgts. 2, 3, 7, pp. 74-76, *infra.*)

4. The court was clearly erroneous in finding that the administrative decisions of Dr. Dunbar, Mr. Crawford, Mr. Larrick, and Mr. Kingsley were made arbitrarily and capriciously. (Asgts. 8, 9, pp. 76-98, *infra.*)

5. The court was clearly erroneous in finding that the plaintiff's labeling is not fraudulent, misleading in a material respect to the injury or damage of purchasers or consumers, or false or misleading in any particular. (Asgt. 10, pp. 76-98, *infra.*)

6. The court erred in holding that plaintiff's good faith was a material issue in this case. (Asgt. 11, pp. 96-98, *infra.*)

7. The court erred in unreasonably curtailing the cross-examination of Dr. John A. Myers and Wil-

liam S. Casselberry, witnesses for the plaintiff. Asgts. 12-13, pp. 99-102, *infra.*)

8. The court erred in permitting the witness Casselberry to testify as an expert in the field of nutrition that there are no claims in the labeling that are untrue and that certain excerpts from medical and popular writings represented a good cross-section of medical opinion on questions of nutrition. (Asgts. 15, 16, pp. 105-106, *infra.*)

9. The court erred in admitting in evidence an exhibit offered by plaintiff which contained excerpts from medical and popular publications to prove medical opinions in the field of nutrition. (Asgt. 17, p. 105, *infra.*)

10. The court erred in rejecting a scientific article offered by the defendants as to the prevalance of dietary deficiency diseases even though the author, an outstanding man of science, was present for cross-examination. (Asgt. 18, pp. 104-105, *infra.*)

11. The court erred in permitting Dr. John A. Myers to testify to his understanding of what the labeling claimed for Nutrilite, and, upon his understanding of the labeling, that the said labeling did not represent that Nutrilite would cure all cases of dietary deficiency diseases or all cases of common diseases. (Asgt. 21, pp. 105-106, *infra.*)

12. The court erred in permitting Dr. John A. Myers, over defendants' objections, to testify that he found nothing in the labeling that was false or misleading, the said question requiring not only his expert opinions as a medical man but also an evaluation by him as to what the labeling would convey to the persons to whom it was directed. (Asgt. 22, pp. 105-106, *infra.*)

13. The court erred in permitting Lee J. Myers, an attorney and witness for the plaintiff, to testify that the statements in the labeling conformed to the consensus of informed medical opinion, and that the labeling was not false or misleading, misbranded or fraudulent, and would not cause injury or damage to the purchaser or consumer, the said questions requiring expert medical testimony, legal conclusions, and an evaluation of what the labeling would convey to the persons to whom directed. (Asgts. 23, 24, pp. 105-106, *infra.*)

14. The court erred in ruling that objections could not be taken at the trial to testimony in Lee J. Myers' deposition unless the objection was saved when the deposition was taken. (Asgt. 25, pp. 102-103, *infra.*)

15. The court erred in rejecting an official government publication which contained the vital statistics of the United States showing the major causes of death by age groups, which said publication was offered by defendants to disprove the labeling claims that dietary deficiency diseases were the

common diseases most responsible for death from illness. (Asgt. 27, pp. 103-104, *infra.*)

16. The court erred in refusing to permit Dr. E. M. Nelson, a witness for the defendants; to make comparisons between the daily dosage of Nutrilite and minimum daily requirements for the several vitamins and minerals contained therein as established pursuant to law by the Federal Security Administrator. (Asgt. 26, p. 107, *infra.*)

17. The court erred in admitting into evidence, over defendants' objections, memoranda of interviews with five persons prepared by an inspector of the Food and Drug Administration. (Asgt. 20, p. 24, note 10, *supra.*)

18. The court erred in allowing the plaintiff to probe the mental processes of the administrative officials in reaching their decisions. (Asgt. 5, pp. 108-109, *infra.*)

19. The court erred in denying defendants' motion to quash subpoenas duces tecum, served in connection with the oral interrogation of the Federal Security Agency defendants before trial, which required the defendants to deliver to plaintiff all records of the Food and Drug Administration relating to plaintiff, its predecessors, and its product, without requiring a showing of good cause under Rule 34 of the Rules of Civil Procedure for the United States District Courts. (Asgt. 6, pp. 108-109, *infra.*)

SUMMARY OF ARGUMENT

I

The court below held Section 304(a) unconstitutional to the extent that it allowed the administrative finding of probable cause to be made without a hearing. But this finding is merely preliminary to the institution of proceedings in court, which fully satisfied all constitutional requirements for a hearing. A great many decisions hold that due process does not require a hearing at the initial stage or any particular stage of an administrative proceeding, so long as an administrative or judicial hearing is held before any official binding order is entered. *E.g., Lichter* v. *United States*, 334 U.S. 742, 791-793; *Bourjois, Inc.* v. *Chapman*, 301 U.S. 183, 189. This principle applies *a fortiori* where the Administrator makes a mere preliminary finding of probable cause to institute a judicial proceeding. Any injury to appellee, while its product is detained until the outcome of the litigation, does not render unconstitutional the statutory scheme authorizing the suspension *pendente lite*, for the protection of the public, of allegedly unlawful activity. *Bowles* v. *Willingham*, 321 U.S. 503, 520; *Yakus* v. *United States*, 321 U.S. 414, 422-423; *Phillips* v. *Commissioner*, 283 U.S. 589, 596-597.

II

A. The District Court had no jurisdiction to review the administrative finding of probable cause.

This finding is merely a preliminary ruling such as the courts have consistently refused to review. Its only legal effect is as a condition precedent to a request that the Department of Justice institute libel proceedings, and even after the Department, in the exercise of its own authority, commences suit, the articles are condemned only after trial in a district court. Such administrative recommendations having no legal effect in themselves are not reviewable. *Chicago & Southern Air Lines* v. *Waterman S. S. Corp.*, 333 U.S. 103, 112-113; *United States* v. *Los Angeles and Salt Lake R. Co.*, 273 U.S. 299. This conclusion is not affected by the fact that the commencement of the litigation which will determine appellee's rights may in itself be expensive to the defending party. Cf. *Myers* v. *Bethlehem Shipbuilding Corp.*, 303 U.S. 41, 51-52.

B. This general principle of non-reviewability is reinforced by specific manifestations of legislative intention that the administrative finding of probable cause was not to be reviewable. The very fact that Congress provided that the preliminary finding of probable cause be made without a hearing demonstrates that it was not to be judicially reviewed. Specific provisions of the Act for judicial review of other administrative determinations show that no review of the finding of probable cause was intended. *Switchmen's Union* v. *National Mediation Board*, 320 U.S. 297, 305-306. The history of the statute here involved also shows that power

to restrain multiple libels was eliminated from the bill after a preliminary administrative finding of probable cause was required. Furthermore, review of the administrative finding in an injunction suit prior to permitting multiple seizures would defeat the statutory purpose to stop distribution of a product deemed to be materially misbranded in a manner injurious or damaging to consumers before it reaches the public. The jurisdictional question here presented thus goes to the heart of the effectiveness of the scheme established by Congress to protect the public health and welfare.

C. The District Court also lacked jurisdiction as a court of equity because appellee had an adequate remedy at law. Section 304 allows a claimant of products libeled in more than one action to have the various proceedings consolidated for trial in a single district. Equity will not grant relief against a multiplicity of suits when the cases can be consolidated for trial. 1 Pomeroy, *Equity Jurisprudence* (5th Ed., 1941), pp. 495, 506, 511. Nor do the various types of injury alleged by appellee provide a basis for not giving effect to the carefully devised statutory procedure for consolidation.

D. The District Court also lacked jurisdiction to determine whether appellee's labeling was misleading. The preceding discussion of the statutory procedure shows that Congress intended this question to be decided by the court in which the libel proceedings are tried. To permit the basic issue as to

the deceptive character of the labeling to be decided in an injunction suit while the pending seizures were, at the command of the injunction court, held in abeyance, would be inconsistent with the basic purpose of Section 304 to protect the public during the period of pendency of the litigation. The injury to the owner of the products which often results when multiple seizures are begun was to be alleviated by consolidation, not by resort to a suit for injunction in the District of Columbia. The argument as to lack of equity jurisdiction is equally applicable to this aspect of the case.

III

If the District Court had jurisdiction to determine such issues, it should have found that the facts amply support the administrative determination of probable cause and that appellee's labeling is misleading. There was no substantial dispute in the medical testimony that Nutrilite, a vitamin and mineral product, would not cure or prevent most common diseases. The critical question was whether the administrative officials had reason to believe that appellee's booklets would give the reader a contrary impression. The 58-page booklet unquestionably represented, through testimonials, that Nutrilite was effective in the treatment of symptoms of serious diseases. Even after the testimonials were eliminated, a number of statements in the booklets were unquestionably false. And

an examination of the booklets as a whole, in the light of the conceded medical facts as to the inability of Nutrilite to cure or prevent most common diseases, demonstrates that they were designed to give readers a false impression that Nutrilite would prevent or cure all but acute ailments, and that almost everyone needed it in order to avoid dietary deficiency. See pp. 77-96, *infra*. "Deception may result from the use of statements not technically false or which may be literally true. The aim of the statute is to prevent that resulting from indirection and ambiguity, as well as from statements which are false." *United States* v. *95 Barrels* * * * *Vinegar*, 265 U.S. 438, 442-443. "Advertisements as a whole may be completely misleading although every sentence separately considered is literally true." *Donaldson* v. *Read Magazine*, 333 U.S. 178, 188-189. The evidence of record demonstrates not only that the administrative finding was a reasonable one, but that the finding of the court below that the booklets were not misleading was utterly erroneous.

Appellee's good faith in issuing the booklets is irrelevant if they are misleading. *United States* v. *Dotterweich*, 320 U.S. 277, 281. Moreover, despite the finding below to the contrary, we think that the record clearly demonstrates that appellee was merely trying to avoid prosecution by the Government, not to be honest in its dealings with the public.

IV

If the Court should decide all of the above questions adversely to the Government, it becomes necessary to deal with the many errors committed by the District Court in the course of the trial. These consisted in brief of the improper curtailment of cross-examination of appellee's witnesses, incorrect rulings in excluding evidence offered by appellants and admitting, sometimes inconsistently, evidence offered by appellee, and improperly allowing interrogation of administrative officials and discovery of administrative records. In their cumulative effect, these errors seriously prejudiced the defense in the district court.

ARGUMENT

I

The Due Process Clause Does Not Prevent Congress from Authorizing Administrative Determinations of Probable Cause, Upon Which Institution of Multiple Seizure Suits Is Conditioned, to Be Made Without a Hearing

The original Food and Drugs Act of 1906 (34 Stat. 768, 771, Section 10) provided for the seizure of misbranded food and drugs "by a process of libel for condemnation." The Act in no way restricted the power of the Government to commence a number of separate condemnation proceedings against different shipments of the same article, and such multiple seizures were not uncommon.

When the food and drug legislation was revised in 1938 and embodied in the present Federal Food,

Drug, and Cosmetic Act, the libel for condemnation provision was incorporated in Section 304(a) (52 Stat. 1040, 1044, 21 U. S. C. 334). The revised provision limits the authority of the Government to institute more than one libel proceeding against different shipments of the same misbranded product [12] by requiring compliance with one of certain conditions before more than one such proceeding can be instituted.[13] The provision pertinent to the constitutional issue here is that which permits the institution of more than one libel for condemnation "when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency that the misbranded article is dangerous to health, or that the labeling of the misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer." Section 304(b) provides that when more than one condemnation proceeding is filed, the claimant can have the proceedings consolidated for trial.

---

[12] If there has been a prior judgment in favor of the United States, or if the drug is libeled because it is "adulterated," as distinct from misbranded, there is no bar whatever to multiple actions based upon the same charge. "Adulteration" is used in the statute in a special sense. Sections 402, 501. The Act provides its own glossary. *United States* v. *Coca Cola Co.*, 241 U. S. 265. For example, a drug is deemed to be "adulterated" if it fails to meet standards of strength, quality, or purity prescribed in the United States Pharmacopoeia.

[13] The history of the libel provisions is discussed at greater length in Point II, pp. 52-58, *infra*.

The court below concluded that (R. 770):

> The following provisions [of the Act] * * * are unconstitutional under the due process clause of the Fifth Amendment to the Constitution of the United States: "* * * such limitations shall not apply * * * when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employe of the agency that * * * the labeling of the misbranded article * * * would be in a material respect misleading to the injury or damage of the purchaser or consumer."

The court did not write any opinion expressly indicating the basis for its conclusion as to the invalidity of the quoted portion of the statute. It is clear from the record and findings, however, that the court was of the view that the constitutional defect resided in the provision permitting the Administrator to act without hearing. It is not entirely clear whether the decision below means (a) that the Constitution precludes the institution of more than one judicial proceeding against different shipments of an article, in the absence of a prior administrative hearing, or only (b) that, if Congress provides for an administrative finding as prerequisite to suit the Constitution requires that such finding must be preceded by a hearing.

If the first theory is the basis for the decision below, the Food and Drugs Act would have been

unconstitutional since 1906, inasmuch as prior to the 1938 Act there was no requirement for any administrative action at all before the commencement of more than one condemnation proceeding. Furthermore, even the present Act contains no limitation upon the right to make multiple seizures of products which are adulterated (Sec. 304). It is more likely, therefore, that the decision below was predicated upon the second theory, and that the statute was held unconstitutional because the 1938 limitation upon the power of the Government to bring more than one action[14] in condemnation permits an administrative finding without a prior hearing.

It is unnecessary, however, to resolve these doubts as to the precise legal theory embodied in the decision below. For many holdings of this Court demonstrate the unsoundness of either theory and the validity of the statute as enacted and as here applied.

The administrative finding of probable cause required by Section 304(a) is merely the prerequisite to the bringing of a lawsuit. Not until the Administrator has made the required finding is he in a position to request the Department of Justice to institute more than one condemnation proceeding against different shipments of the mis-

[14] The decree, however, also enjoins the first libel (R. 771-772), as to which no administrative finding of probable cause is required by the statute.

branded product. After the finding has been made, the Department may file libels for condemnation, accompanied by seizures of the property in question against different shipments. The owner of the property then has an opportunity to appear as claimant, and he is entitled to a full hearing before a district court in which one libel has been filed or to which the various cases may be removed and consolidated for trial. The statute (Section 304(b)) provides that the procedure shall conform to the "procedure in admiralty," except that on demand of either party trial shall be by jury.

Such a trial in court fully satisfies all constitutional requirements. We have been unable to discover any authorities to support the notion that the due process clause of the Constitution requires an administrative hearing in order to determine whether there is probable cause for instituting a judicial proceeding in which the matter will be fully tried.

On the contrary, a great many decisions of this Court show plainly that the due process clause has never been regarded as containing any such unreasonable requirement. The Court has stated in at least three recent cases that "the demands of due process do not require a hearing, at the initial stage or at any particular point or at more than one point in an administrative proceeding so long as the requisite hearing is held before the final order becomes effective." *Lichter* v. *United*

States, 334 U. S. 742, 791-792; *Inland Empire Council* v. *Millis*, 325 U. S. 697, 710; *Opp Cotton Mills* v. *Administrator*, 312 U. S. 126, 152-153. See to the same effect *Bowles* v. *Willingham*, 321 U. S. 503, 519-520. In each of the cases cited, the statute permitted an administrative agency to make a preliminary determination, after which a full administrative hearing was available to any aggrieved party.

The principle enunciated in those decisions would seem to have particular force where, as here, the subsequent hearing is to be held before a court in lieu of an administrative body. Many cases have held that an administrative hearing is not essential to due process where no final action takes place until after the case has been heard by a court. In 1918 this Court stated that "this, as repeatedly has been held, satisfies the requirements of due process of law." *Wells-Fargo & Co.* v. *Nevada*, 248 U. S. 165, 168. Other cases to the same effect are *Bourjois, Inc.* v. *Chapman*, 301 U. S. 183, 189; *Utley* v. *St. Petersburg*, 292 U. S. 106, 109; *Nickey* v. *Mississippi*, 292 U. S. 393, 396; *American Surety Co.* v. *Baldwin*, 287 U. S. 156, 168; *Coffin Bros.* v. *Bennett*, 277 U. S. 29, 31; *Mount St. Mary's Cemetery* v. *Mullins*, 248 U. S. 501, 506; *Pittsburgh &c. Railway* v. *Board of Public Works*, 172 U. S. 32, 45; *Wilson* v. *Standefer*, 184 U. S. 399, 415; *Gallup* v. *Schmidt*, 183 U. S. 300, 307; *Winona & St. Peter Land Co.* v. *Minnesota*, 159 U. S. 526, 537; *Hagar* v. *Reclamation District*, 111 U. S. 701.

In most of the cases cited, the administrative or taxing agency made a determination as to the merits of the matter in issue before the question was submitted to a court. The correctness of the Government's position in the present case would seem to follow *a fortiori*. Here the Administrator made a mere preliminary finding. He did not finally adjudicate the contraband character of the drug. He did not purport to decide the question which would be before the court, but only whether there was probable cause to believe that the product had been materially mislabeled, sufficient to warrant the institution of the judicial proceeding. In other words, the Administrator, far from making any definitive adjudication, merely found that the facts presented an issue for adjudication by a court. Even in the absence of the express provision of the statute that such a preliminary finding could be made "without hearing," a hearing would not have been required as a condition precedent to the making of such a determination. Compare *Isbrandtsen-Moller Co.* v. *United States*, 300 U. S. 139, 149. While the Constitution may require a hearing by an administrative agency when an issue is committed to administrative adjudication rather than to judicial determination, it obviously does not require an administrative hearing as a prerequisite to an administrative agency's right to report facts to prosecuting officials for trial and determination in a district court. The Constitution does not require that those functions of Gov-

ernment that traditionally have been conducted as investigative and reporting activities preliminary to a lawsuit be conducted by judicial methods. Cf. *United States* v. *Morton Salt Co.*, 338 U. S. 632, 641.

Probably the closest analogy is the institution of criminal proceedings by an indictment returned by a grand jury. The grand jury determines, in substance, that there is probable cause to believe that the accused is guilty; the result is that the defendant may be arrested and held for trial. *Beavers* v. *Henkel*, 194 U. S. 73, 84. The proceeding before the grand jury is obviously not a "hearing" in the usual sense, inasmuch as the defendant has no right to appear and present his own witnesses or to cross-examine the Government's witnesses. Clearly, if such a hearing is not essential to a finding of probable cause when the liberty of an individual is at stake, the same must be true with respect to a similar administrative finding which serves as a statutory prerequisite to the institution of legal proceedings affecting an individual's property. This Court has recognized that "the finding of an indictment, fair upon its face, by a properly constituted grand jury, conclusively determines the existence of probable cause for the purpose of holding the accused to answer." *Ex parte United States*, 287 U. S. 241, 250. The Constitution can require no more as to a determination

of probable cause made "for the purpose of holding" food or drugs alleged to be misbranded.

Appellee will doubtless argue that the withholding of the seized property until the conclusion of the libel action is injurious, both because of the interference with its business operations during the interim and because the quality of the product may deteriorate,[15] even though the product will eventually be returned if the Government does not establish its case. But injury of this sort does not render unconstitutional judicial proceedings in which a defendant is temporarily restrained from continuing his allegedly unlawful conduct *pendente lite*. The public interest has often been held to justify a temporary and probably costly suspension of activities claimed by the Government to be unlawful and injurious to the public interest. In *Phillips* v. *Commissioner*, 283 U. S. 589, 596-597, in language reaffirmed in *Bowles* v. *Willingham*, 321 U. S. 503, 520, the Court declared:

> Where only property rights are involved, mere postponement of the judicial enquiry is not a denial of due process, if the opportunity given for the ultimate judicial determination of the liability is adequate. *Springer* v. *United States*, 102 U. S. 586, 593; *Scottish Union & National Ins. Co.* v. *Bowland*, 196 U. S. 611, 631. Delay in the judicial determination of

[15] As to the degree and rate of deterioration, see pp. 73-74, *infra*.

property rights is not uncommon where it is essential that governmental needs be immediately satisfied. For the protection of public health, a State may order the summary destruction of property by administrative authorities without antecedent notice or hearing. Compare *North American Cold Storage Co.* v. *Chicago*, 211 U. S. 306; *Hutchinson* v. *Valdosta*, 227 U. S. 303; *Adams* v. *Milwaukee*, 228 U. S. 572, 584. Because of the public necessity, the property of citizens may be summarily seized in war-time. *Central Union Trust Co.* v. *Garvan*, 254 U. S. 554, 566; *Stoehr* v. *Wallace*, 255 U. S. 239, 245; *United States* v. *Pfitsch*, 256 U. S. 547, 553. Compare *Miller* v. *United States*, 11 Wall. 268, 296; *International Paper Co.* v. *United States*, 282 U. S. 399; *Russian Volunteer Fleet* v. *United States*, 282 U. S. 481. And at any time, the United States may acquire property by eminent domain, without paying, or determining the amount of the compensation before the taking. Compare *Kohl* v. *United States*, 91 U. S. 367, 375; *United States* v. *Jones*, 109 U. S. 513, 518; *Crozier* v. *Fried. Krupp Aktiengesellschaft*, 224 U. S. 290, 306.

The *Phillips* case held that the collection of taxes could be enforced in advance of the opportunity to litigate their validity. In *Yakus* v. *United States*, 321 U. S. 414, 442-443, the Court sustained the provision of the Emergency Price Control Act permitting the minimum prices established by the Administrator to remain in effect pending their

review in the courts. This Court stated (321 U. S. at 442):

> Our decisions leave no doubt that when justified by compelling public interest the legislature may authorize summary action subject to later judicial review of its validity.

The *Yakus* opinion then proceeded to give the same illustrations found in the above quotation in the *Phillips* opinion, and to add others.

Both the *Phillips* and *Yakus* opinions cite, as a prominent example of the right of the State to act without a prior hearing, the cases permitting the summary destruction of property for the protection of the public health. The libel provision of the food and drug legislation, which is modeled on the procedure in admiralty, does not go nearly that far. It provides only for the interim protection of the public against the distribution of food and drugs believed to be dangerous to health or misbranded in a fraudulent or materially misleading respect, by holding the products until the legality of the branding has been determined. In view of the great harm which members of the public may suffer if even harmless articles are allowed to be sold as panaceas for illness or disease, there can be no question as to the reasonableness and fairness of a statutory procedure which treats the interest of the public, *pendente lite*, as superior to that of the owner of the product. Cf. *Yakus* v. *United States*, 321 U. S. at 437-443.

II

The District Court Had No Jurisdiction to Review the Administrative Determination of Probable Cause or to Decide Whether Appellee's Labeling Was Misleading

The formal "Conclusion of Law" entered by the court below (Conclusion 4, R. 770-771) was that the officials of the Food and Drug Administration had acted arbitrarily in instituting multiple libel proceedings without first affording the appellee a hearing on the issue of whether there was probable cause to believe that its labeling was fraudulent or misleading in a material respect. Obviously, the mere failure to grant appellee a hearing could not be arbitrary or capricious or oppressive, if we are correct in our previous contention that Congress could constitutionally provide that the determination of probable cause could be made without a hearing. If the statute is valid, the officials did not violate the Constitution merely by following the express terms of the law.

The court below also held, in accordance with appellee's contentions, that the administrative officials acted capriciously, arbitrarily and unreasonably in making their decisions with respect to appellee's product (Fdg. 43, R. 770). The plain implication of this finding would seem to be that the determinations of probable cause were invalid because the officials who made such determinations had no rational basis for their actions. Furthermore, the court also held that the labeling of ap-

pellee's product was not false and misleading in any particular (Fdg. 12(f), R. 759-760).[16]

It is our contention that the court lacked jurisdiction to pass upon these issues. The finding serves merely as a condition precedent to a recommendation for the institution of judicial proceedings, and under established principles is not ripe for review. Furthermore, whether the labeling was misleading was intended to be determined in the condemnation proceedings. In addition, we shall show that since the statute provides an adequate remedy at law for persons against whose product more than one libel is instituted, the court below, as a court of equity, lacked jurisdiction to decide these issues in this injunction suit brought against the administrative officials.

A. Preliminary Administrative Rulings Which Are Mere Prerequisites to the Commencement of Additional Proceedings Are Not Reviewable

The Administrator's finding of probable cause is not reviewable since it is only a preliminary ruling of a sort which the courts have consistently refused to review. The finding is, it is true, a necessary prerequisite to the commencement of more than a single libel action based upon the same alleged misbranding. But the only positive effect of a finding is to enable the Administrator to re-

[16] These conclusions, though contained in the formal Findings of Fact, rather than in the Conclusions of Law, are in fact legal conclusions. They clearly constitute a part of the reasoning of the court below in support of its judgment.

quest the Department of Justice to cause the libels to be instituted. The Department is not bound to accept the Administrator's recommendation.[17] Even if it should do so, it only initiates the proceeding, and the drugs may be condemned only after trial by the district court.

In *Chicago & Southern Air Lines* v. *Waterman S. S. Corp.*, 333 U. S. 103, 112-113, and *United States* v. *Los Angeles and Salt Lake R. Co.*, 273 U. S. 299, this Court was also requested to review administrative rulings which were conditions precedent to the entry of final decisions but which in themselves had no binding legal consequences. The final valuations of the Interstate Commerce Commission which were before the Court in the *Los Angeles and Salt Lake* case were made "prima facie evidence of the value of the property" in subsequent rate proceedings (273 U. S. at 310-311). The decisions of the Civil Aeronautics Board such as were involved in the *Chicago & Southern* case are under the statute necessary prerequisites to Presidential action. The President need not follow the Board's recommendations, though he generally

---

[17] "* * * while the Attorney General, in the performance of his official duties, has power to decide, or delegate power to decide, whether a particular statute has been violated and, if so, whether to initiate prosecution, his judgment is not in any way controlled by a report from the Federal Security Administrator, much less by the declaration or recommendation of an officer subordinate to the Federal Security Administrator; specifically, he is under no 'mandatory duty' to do anything under such circumstances." *Helen Products Co., Inc.* v. *McNutt*, 137 F. 2d 681, 683 (C.A. D.C.).

does. As the Court stated in the *Chicago & Southern* case, the Board's decision "may be a step which if erroneous will mature into a prejudicial result, as an order fixing valuations in a rate proceeding may foreshow and compel a prejudicial rate order." But, the Court continued, "administrative orders are not reviewable unless and until they impose an obligation, deny a right or fix some legal relationship as a consummation of the administrative process."

This principle that preliminary or intermediate agency action shall not be directly reviewable is also recognized in Section 10(c) of the Administrative Procedure Act.[18]

It may be suggested that the administrative finding of probable cause does constitute the "consummation of the administrative process," inasmuch as the Administrator himself takes no further action. But his finding results only in a recommendation that the Department of Justice proceed. It is apparent that his finding is not the conclusion of the administrative process, even if the subsequent judicial participation in the proceedings be disregarded.

[18] "Every agency action made reviewable by statute and every final agency action for which there is no other adequate remedy in any court shall be subject to judicial review. Any preliminary, procedural, or intermediate agency action or ruling not directly reviewable shall be subject to review upon the review of the final agency action." Section 10(c), 5 U.S.C. 1009(c).

But if it be assumed that the intervention of the Department of Justice between the Administrator and the district court may not be taken into account, on the ground that the Department is an automatic conduit for the Administrator's wishes—which it is not—appellee is in no better position. For it cannot be said that an administrative finding which is a condition precedent to a trial *de novo* in a court before rights are determined is any more reviewable than a finding which serves merely as a prerequisite to further administrative proceedings. If anything, the reasoning of the decisions cited would seem to apply even more clearly in the former case.

The finding of probable cause prior to the institution of legal proceedings is by no means peculiar to the Food, Drug, and Cosmetic Act. The function of the grand jury is to determine whether there is "probable cause" to believe that a defendant is guilty before subjecting him to the burden of trial. *Beavers* v. *Henkel*, 194 U. S. 73, 84. But persons charged with crime cannot sue to enjoin prosecution on the ground that the evidence before the grand jury was insufficient to show probable cause. Indeed, they are not entitled to any trial of that issue. *Ex parte United States*, 287 U. S. 241, 250, quoted at p. 42, *supra*. Although the grand jury proceeding is a guarantee against arbitary action, it does not accord the defendant a chance to try his case twice—or even to have a hearing upon the

question of probable cause at all. See p. 42, *supra*. The language of this Court, although uttered in a factually different connection in *Beavers* v. *Henkel*, which involved removal proceedings after indictment, sets forth the general considerations relevant here:

> The thought is that no one shall be subjected to the burden and expense of a trial until there has been a prior inquiry and adjudication by a responsible tribunal that there is probable cause to believe him guilty. But the Constitution does not require two such inquiries and adjudications. The government, having once satisfied the provision for an inquiry and obtained an adjudication by the proper tribunal of the existence of probable cause, ought to be able without further litigation concerning that fact to bring the party charged into court for trial. [194 U.S. at 84-85.]
>
> The indictment alone was, as we have seen, a showing of probable cause sufficient to justify the issue of a warrant. [194 U.S. at 87.]

Appellee may urge that the finding of probable cause should not be treated as merely preliminary in nature since the institution of more than one libel proceeding, with the resultant seizures, will cause it financial injury. But the commencement of litigation is often expensive or otherwise harmful to the defending party. See *Myers* v. *Bethlehem Shipbuilding Corp.*, 303 U.S. 41, 51-52. The grand jury's non-reviewable finding of probable cause may result in immediate arrest and imprisonment. This will

generally be true when the commencement of legal proceedings is accompanied by the seizure of property. In none of these situations will a court of equity in a separate injunction suit interfere with the normal processes of litigation by predetermining the issues in order to prevent injury *pendente lite*. Here, Congress has determined, through its establishment of the libel procedure, that the claimant and not the public must endure possible injury during the pendency of the litigation. See pp. 43-45, *supra*. Such a legislative determination should not be frustrated by permitting this type of injunction suit to be maintained.

B. The Statute and Its History Show That the Administrative Finding of Probable Cause Was Not Intended to Be Subject to Judicial Review

In addition to the general considerations just referred to, the history of the Federal Food, Drug, and Cosmetic Act shows that the administrative finding of probable cause was not intended to be subject to judicial review.

1. *The History of the Pertinent Statutory Provisions.*

As has been noted, under the Federal Food and Drugs Act of 1906, 34 Stat. 768, 774, goods that were adulterated or misbranded were subject to seizure wherever found, and multiple seizures were regularly made. The Act of 1906 was revised comprehensively in 1938. Long and careful consideration, extending from the 73d to the 75th Congresses, was

given to the redrafting of the section relating to libels and seizures, with particular reference to the problem of multiple libels. Bills originally proposed provided for *executive* seizures of articles "dangerous to health" [19] and placed no limitation on the number of libel suits that might be brought.

Subsequently, the legislation was redrafted to grant to the United States District Courts jurisdiction to restrain a multiplicity of seizures based upon the same alleged misbranding unless the misbranding involved danger to health or "gross deception," or unless it had been the basis of a prior judgment in favor of the United States.[20] That bill would have authorized suits of the kind here involved.

Still later, the Senate accepted an amendment which would have placed upon the administrative agency the duty to "show cause" in a United States District Court why multiple seizures were necessary.[21] This would have permitted a judicial determination of "probable cause" such as appellees have obtained in this case.

During the progress of the bill through the 74th Congress, after the addition of the requirement of

[19] S. 2000 and S. 2800, 73d Cong., 2d Sess., Sec. 16(a). These bills appear in Dunn, *Federal Food, Drug, and Cosmetic Act* (1938), pp. 52, 71, which contains a complete statement of the legislative history of the Act. See also S. 5, Sec. 711, Dunn, p. 232, and S. Rep. 361, 74th Cong., 1st Sess., p. 29, Dunn, p. 263.

[20] S. 2800, as reported to Senate, February 6, 1934, 73d Cong., 2d Sess., Sec. 19(c), Dunn, pp. 105-106.

[21] S. Rep. 361, 74th Cong., 1st Sess., Part 2, p. 11; 79 Cong. Rec., 5230-5231, Dunn, pp. 389, 399, 467-469.

an administrative finding of probable cause, and the provisions for consolidation,[22] the provisions authorizing executive seizures and judicial "show cause" proceedings were dropped.[23] The House Committee in the 74th Congress also eliminated the provision of the Senate bill that would have granted the district courts jurisdiction to restrain a multiplicity of libel actions.[24]

The Senate bill at this stage only allowed multiple seizures (in the absence of a prior judgment) where misbranding rendered the article "imminently dangerous to health."[25] The House Committee rejected this limitation (Dunn, p. 528), and added a provision authorizing multiple seizures in cases where the Secretary had probable cause to believe that the misbranding was "in a material respect false, misleading or fraudulent"[26] The House Committee Report[27] stated with respect to

---

[22] S. 5, as reported to Senate, January 3, 1935, 74th Cong., 1st Sess., Sec. 711(c), Dunn, 213, 233.

[23] 79 Cong. Rec. 8354, Dunn, pp. 505-506.

[24] H. Rep. 2755, 74th Cong., 2d Sess., p. 10, Dunn, pp. 529, 558. The Committee Report stated in this connection: "This subsection was struck out because it seemed to the committee to be either unnecessary or else susceptible of the possible construction that it might give each district court authority to issue injunctions which would operate throughout the United States."

[25] 79 Cong. Rec. 5230-5231, Dunn, pp. 467-469; S. Rep. No. 646, 74th Cong., 1st Sess., p. 13, Dunn, pp. 488-489.

[26] S. 5, as reported in H. Rep. No. 2755, 74th Cong., 2d Sess., May 22, 1936, 80 Cong. Rec. 7830, Dunn, pp. 546, 558.

[27] H. Rep. 2755, 74th Cong., 2d Sess., p. 9, Dunn, pp. 550, 558.

this modification, which in substance conforms closely to the Act as finally passed:

> There are two substantive changes made by this committee. One is that multiple seizures would be permitted in cases where the Secretary has probable cause to believe that the misbranding is in a material respect false, misleading, or fraudulent. This will permit protection of the public against such nostrums as a brew of weeds labeled as a treatment for diabetes and against innumerable other cheats and frauds which at best rob the consumer's pocketbook, and at worse rob him of health or life through his mistaken reliance upon them while his disease progresses unchecked. With this change the seizure section will continue to function as a means of "arresting the bullet in flight before it claims its victim", although the administrative agency will have materially less latitude, in making multiple seizures, than it has had under the present law for the past 30 years.

The Senate agreed to the House provision in a compromise bill,[28] but the bill did not pass the House at that session for other reasons.[29]

Substantially the same version of this provision was included in S. 5 as introduced in the 75th Congress (Dunn, p. 642), but the Senate Committee in reporting the bill omitted the language previously

[28] 80 Cong. Rec. 10514, 10518, 10520, Dunn, pp. 598, 613-614, 619.

[29] 80 Cong. Rec. 10674-10680, Dunn, pp. 620-633.

added by the House.[30] Prior to passage in the Senate, a clause was added permitting multiple seizures if the misbranding "is in a material respect false *and* fraudulent, or is labeled or advertised as a cure or remedy for cancer," and other named diseases.[31] The House, nevertheless, adhered substantially to the language which it had proposed at the previous Congress, which included, in addition to the phrase "dangerous to health," misbranding which was "in a material respect false *or* fraudulent."[32] The

[30] S. 5, as reported in 75th Cong., 1st sess., February 15, 1937, p. 14, 81 Cong. Rec. 1194, Dunn, pp. 655, 662; S. Rep. 91, 75th Cong., 1st sess., p. 4, Dunn, pp. 678-679.

[31] 81 Cong. Rec. 2007, 2013, Dunn, pp. 709-710, 725, 726.

[32] S. 5 as reported to House, April 14, 1938, 83 Cong. Rec. 5465, Dunn, pp. 780, 798; H. Rep. No. 2139, 75th Cong., 3d sess., p. 4, Dunn, p. 818; 83 Cong. Rec. 7790, 7903, Dunn, pp. 892, 963. H. Rep. No. 2139, p. 4, Dunn, p. 818, makes it clear that the object of the change from the Senate version was to make proof of intent to deceive unnecessary. The report states:

> Multiple seizures may be made on adulterations and on misbranding "when the Secretary has probable cause to believe that the misbranded article is dangerous to health or that the labeling of the misbranded article is, in a material respect, false or fraudulent." This represents substantially the administrative policy followed by the Department of Agriculture in the more than 30 years the old law has been enforced.
>
> The language adopted by your committee differs from that of the Senate act in that in the provision above quoted, the words "false and fraudulent" rather than "false or fraudulent" are used. If a misbranding is sufficiently serious to justify the removal of the product from the market to safeguard the consumer against harm, then it is wholly immaterial whether the falsity of the labeling is a matter of gross carelessness or inadvertence, or whether it was grounded on a deliberate intent to deceive. Since the seizure procedure is peculiarly adapted to the enforcement of a consumer-protective law in that it arrests the illegal goods before the consumer is harmed,

conferee accepted the substance of the House proposal, substituting "in a material respect misleading to the injury or damage of the purchaser or consumer" for "in a material respect, false."[33] Representative Lea, in explanation for the House conferees, stated:[34]

> The object of that change was to make it clear that the misleading statement which it was intended to prohibit by seizure should be of such character as it might mislead a customer or purchaser to his damage. It has in mind consumer protection.

The language finally adopted conformed in substance to what the House had continually insisted upon. Although the Senate proposals had not gone as far, it is clear that the bill as passed included language which was deliberately selected so as to permit multiple libels with respect to products which were in themselves not dangerous to health but which because of their misbranding might be harmful to consumers.[35]

---

your committee has been careful to avoid restricting this form of action in cases where there is actual need for its exercise to protect health or prevent fraud.

[33] See Conf. Rep., H. Rep. 2716, 75th Cong., 3d sess., pp. 5, 22, 83 Cong. Rec. 9089, 9094, Dunn, pp. 974, 992-993.

[34] 83 Cong. Rec. 9095, Dunn, pp. 997, 998.

[35] We have felt it necessary to set forth this legislative history in detail because of the repeated statements of Judge Clark during the proceedings below (R. 17, 579) that "That provision was slipped into the conference report; * * * * * * it was slipped in in conference. * * *. Nobody knew anything about the amendment." Judge Clark had as Senator

The Conference Report which reported the bill as finally passed inserted the words "without hearing" into the provision requiring the Administrator to make a preliminary finding of probable cause.[36] There was no explanation of this change, presumably because its meaning and purpose were obvious.

2. *No Review of the Administrative Finding of Probable Cause was Intended.*

(a) The above summary of the history of the libel provisions of the present statute shows that the bill at one stage specifically gave the United States District Courts power to restrain multiple seizures. But this provision was eliminated after the bill was amended to require an administrative finding of probable cause as a condition to the institution of multiple libel proceedings in the district courts. Thus Congress considered and rejected granting the district courts jurisdiction to determine by injunction whether multiple seizures should be allowed. The scheme whereby a preliminary finding of probable cause was required, and the consolidation of multiple suits permitted, was evidently thought to give the owner of the property adequate protection.

---

been a member of the Conference Committee which, without dissent, approved the bill. H. Rep. No. 2716, 75th Cong., 3d Sess., p. 21, 83 Cong. Rec. 9094, Dunn, p. 992.

[36] H. Rep. 2716, 75th Cong., 3d Sess., pp. 5, 22, 83 Cong. Rec. 9089, 9094, Dunn, pp. 974, 992-993.

(b) The very fact that Congress provided that the preliminary determination of probable cause was to be made without a prior administrative hearing demonstrates that it was not intended to be reviewable at a subsequent judicial hearing. In the absence of an administrative hearing, there will be no record, in the usual sense, for a court to review. Judicial review therefore means, as the present case demonstrates, that, in order to determine whether there was sufficient basis for a preliminary finding, there may be a trial of substantially the same issues as would be canvassed at the libel trial on the merits. Since the reasonableness of the finding depends in large part upon whether the representations in question seem to be misleading, such review would usually, as here, become a *de novo* inquiry into the truth or falsity of the labeling. Furthermore, judicial reexamination of the preliminary administrative determination of "probable cause" might require testimony from the highest officials of the administrative agency as to what was before them and the reasons for their action (but compare *United States* v. *Morgan*, 313 U. S. 409, 422). Thus to allow review of a preliminary finding would in fact result in a full-scale trial in order to determine whether there was probable cause to institute a judicial proceeding which would in itself eventuate in a trial of perhaps considerably smaller dimensions. Clearly, there is nothing in either the text or the history of the

legislation which even suggests that Congress intended its provision for a preliminary finding of probable cause to result in one lawsuit to determine whether there should be another. The same considerations—avoidance of needless delay, adequacy of protection afforded to owner, etc.—which persuaded Congress to dispense with an administrative hearing, also militate against reading into the Act a provision for judicial review at that stage of the proceeding.

(c) When Congress intended administrative determinations under the Federal Food, Drug and Cosmetic Act to be judicially reviewable, it said so. Several sections of the Act authorize review of administrative action. (Sections 505(h), 701(e) and (f), 21 U. S. C. 355(h) and 371(e) and (f)). Section 701, in particular, provides for review of many types of administrative orders.[37] The absence of any such provision with respect to the preliminary finding of probable cause manifests a legislative intent that there be no review of such a finding, much more clearly than in the statute before the Court in *Switchmen's Union* v. *National Mediation Board*, 320 U.S. 297.[38] The language of the Court in that

---

[37] Section 701(f) authorizes judicial review by the United States courts of appeals of administrative action under Sections 401, 403(j), 404(a), 406(a) and (b), 501(b), 502(d), 502(h), 504, 506, 507, and 604 of the Act. 21 U.S.C. 341, 343(j), 344(a), 346(a) and (b), 351(b), 352(d), 352(h), 354, 356, 357, and 364.

[38] Section 10 of the Administrative Procedure Act, 5 U.S.C. 1009, in its introductory clause, excepts agency action from

case is peculiarly applicable here (320 U.S. at 305-306):

> That conclusion is reinforced by the highly selective manner in which Congress has provided for judicial review of administrative orders or determinations under the Act. There is no general provision for such review. But Congress has expressly provided for it in two instances. * * * When Congress in § 3 and in § 9 provided for judicial review of two types of orders or awards and in § 2 of the same Act omitted any such provision as respects a third type, it drew a plain line of distinction. And the inference is strong from the history of the Act that that distinction was not inadvertent.

The deletion from the original bill here of provisions for injunctive relief against multiple seizures, after the probable cause finding was required, makes it clear that the failure to provide for review of the probable cause determinations was no more inadvertent in the Food, Drug, and Cosmetic Act than in the Railway Labor Act.

(d) The consequences of permitting judicial review of the finding of probable cause would to a considerable extent frustrate the purpose of the seizure provisions of the statute. That purpose

---

its review provisions where "(1) statutes preclude judicial review, or (2) agency action is by law committed to agency discretion." Both conditions exist with respect to the probable cause determinations under Section 304 (a).

was not only to protect the consumer against products which are dangerous or branded in a respect which is harmful because materially misleading, but to do so immediately, prior to and not after the inevitable delays of litigation. Congress determined that where the Administrator had probable cause to believe that the public might be harmed or seriously misled, the potential injury to the public *pendente lite*, if distribution of the mislabeled product were allowed to continue, outweighed the harm to the purveyor of the article from the temporary detention of his property.

The sanction of multiple libels is essential to achieve the legislative purpose of arresting distribution of a dangerous product, a fraudulent product, or a materially mislabeled product "before it claims its victim".[39] This sanction provides the only practicable way in which dangerous, fraudulent, or seriously misbranded drugs already shipped in commerce may be removed from the market and held within the custody of law pending a determination of the alleged misbranding. Under the decision below, however, all distributors of food and drugs branded in a seriously misleading manner would have the right to challenge the Government's allegation in an injunction suit in the District of Columbia and to stay the arm of enforcement for months (or, as in this case, 1½ years) while the "probable cause" issue was in litigation.

[39] Quoted from H. Rep. 2755, set forth at p. 55, *supra*.

Indeed, the principal and unconcealed purpose of the instant litigation is to stay the institution of further seizure proceedings and thus permit continued distribution of the drug until after the validity of the appellee's labeling can be determined. It was precisely to avoid the evils of such delay that the Administrator was authorized to make the determination of probable cause without hearing. If the district court has the right to review the administrative decision, the beneficial effects of the expeditious procedure prescribed for administrative action would be nullified, the clear purpose of Congress would be thwarted, and great public harm could be done before shipments of contraband were reported for the institution of appropriate action.

More is involved here than the rights of the parties litigant. The public has an important stake in the determination of the jurisdictional questions. The question is not merely whether continued distribution of Nutrilite under the labeling heretofore used will be injurious or damaging to consumers, as we believe it will. The question is whether the effectiveness of the method devised by Congress for giving the public speedy protection against all nostrums believed to be harmfully misbranded shall be seriously impaired. For if appellee may seek to halt multiple seizures until a court may pass upon the correctness of the administrative determination of probable cause, so may all other distributors

whose products are thought to be so seriously misbranded as to warrant the commencement of more than one seizure proceeding. No means would then exist to protect the consumer from the injurious consequences of protracted proceedings. The damage to the public in such cases is direct and serious, not only in terms of money expended for a materially misbranded drug, but in hazards to the public health involved in self-diagnosis and experimentation with such products in the treatment of disorders requiring prompt and competent medical aid before it becomes too late.

For these reasons, the jurisdictional questions presented by this case are not mere technical matters, such as whether an issue should be tried in one forum or another. The jurisdictional questions here presented go to the heart of the effectiveness of the scheme established by Congress to protect the public health and welfare.

Adherence to the procedure set forth in the statute does not mean that a claimant such as appellee here will be denied a quick decision on the merits of his case. He has his choice of districts, and there is no reason why the libel cannot be tried as promptly as—and perhaps much more speedily than—an injunction suit in the District of Columbia. Here, the first libel against the appellee's property was filed on September 30, 1948. There is no reason to believe that the misleading character of appellee's labeling could not have been determined by one of the district courts long before this time if

appellee had not undertaken to bring the present case.

C. The District Court Lacked Jurisdiction in Equity to Review the Finding of Probable Cause

The district court also lacked jurisdiction, as a court of equity, because appellee had an adequate remedy at law.

Congress sought to establish a procedure whereby (1) when necessary for the protection of the public, distribution of seriously misbranded articles would be stopped *in limine* by seizure of the articles throughout the country, and (2) the owner of the product would not be unduly harassed by having to try a multiplicity of lawsuits.

Paragraph (b) of Section 304 contains special provisions to prevent the owner of the libeled product from having to try libel actions in different parts of the country. Where libels involving the same claimant and issues of misbranding are pending in two or more districts, they are to be consolidated for trial in "(1) any district selected by [the claimant] where one of such proceedings is pending; or (2) a district agreed upon by stipulation between the parties"; or (3) in a district of reasonable proximity to the claimant's principal place of business, if so ordered by the court.

Not until April, 1949, did appellee make use of these provisions of the Act, and then only to seek consolidation in its home district (Finding 37, R. 768-769), a district not included within the districts in which a claimant is entitled as a matter

of right to obtain consolidation under the statute.[46] If appellee had obtained an order of consolidation

[46] The statutory provision permitting removal by court order to "a district of reasonable proximity to the claimant's principal place of business" (Section 304(b)) has consistently been held to mean "a district other than that of the domicile of the claimant." *United States* v. *600 Units*, 60 F. Supp. 144, 145 (W. D. Mo.); *United States* v. *Six Dozen Bottles*, 55 F. Supp. 458, 459 (E. D. Wis.); *United States* v. *26 Dozen Bottles*, 60 F. Supp. 626 (W. D. Mich.); *United States* v. *23 Gross Jars * * * Knea Cream*, 86 F. Supp. 824 (N. D. Ohio); *United States* v. *378 Dozen Small Size, etc., Emerson's Brand Seltzer*, (S.D. N.Y.), printed in Kleinfeld & Dunn, *Food, Drug, and Cosmetic Act, 1938-1949*, p. 1; *United States* v. *15 Cartons of Sekov Reducer*, (S.D. Tex.), printed in Kleinfeld & Dunn, p. 12. This conclusion is supported by the legislative history of the provision. An early version of the bill expressly contemplated removal to the district in which was located the claimant's principal place of business. S. 5, 75th Cong., 1st Sess., p. 13. House draft of March 10, 1937, Dunn, p. 780. A subsequent version of the bill changed the pertinent language to: "* * * the proceeding pending or instituted shall, on application of the claimant, seasonably made, be removed for trial to any district in a State contiguous to the State of the claimant's principal place of business." * * *" S. 5, 75th Cong., 3d sess., House draft of April 14, 1938, p. 53, Dunn, p. 798; see H. Rep. No. 2139, 75th Cong., 3d sess., p. 4, Dunn, p. 818. The debate in the House indicated that the object of this change was to provide for trial on "what might be called neutral ground," that "the position was that the claimant is entitled to a neutral court, and it might be disadvantageous for the Government to go into the State where the claimant resided, where the influence perhaps in favor of the manufacturing concern might make it impossible for the Government to get a fair trial." 83 Cong. Rec. 7791, Dunn, p. 895. (Statement by Representative Lea, a member of the Committee). See also 83 Cong. Rec. 7784-7785, Dunn, pp. 875, 878. The final change in this language, in conference, to "a district of reasonable proximity to the claimant's principal place of business" was obviously designed to continue to exclude claimant's home district, but to allow removal to any district of reasonable proximity to claimant's principal place of business, whether that district was in the same State or not. See H. Rep. No. 2716, 75th Cong., 3d sess., pp. 22-23, Dunn, pp. 975, 998. For proof that there was a reasonable basis for not requiring the Government to proceed in a claimant's home district, see the illustration given by Judge Knox in *A Judge Comes of Age* (Scribner's 1941), p. 243.

in the fall of 1948 and had endeavored to obtain an early trial with as much vigor as it has pressed this case, the legality of appellee's labeling would doubtless have been long since determined, after a single trial, by jury if requested. If appellee had prevailed, its products would probably have been returned to it long before deterioration would take place. See pp. 73-74, *infra*.

1. *Multiplicity.*

It is axiomatic that equity will not grant relief where there is an adequate remedy at law. This maxim applies when relief is sought in order to avoid a multiplicity of suits. This Court has defined the standards applied when this basis for equity jurisdiction is invoked. (*Di Giovanni* v. *Camden Fire Ins. Assn.*, 296 U. S. 64, 70-71, quoting from *Hale* v. *Allinson*, 188 U. S. 56, 72-77):

> ". . . the decision must depend largely upon the question of the reasonable convenience of the remedy, its effectiveness and *the inadequacy of the remedy at law* . . . Each case, if not brought directly within the principle of some preceding case, must, as we think, be decided upon its own merits and upon a survey of the real and substantial convenience of all parties, *the adequacy of the legal remedy*, the situations of the different parties, the points to be contested and the result which would follow if jurisdiction should be assumed or denied: . . . The single fact that a multiplicity of suits may be prevented by this assumption of juris-

diction is not in all cases enough to sustain it. * * *" [Italics supplied.]

The *Di Giovanni* case, and also *Aircraft & Diesel Equipment Corp.* v. *Hirsch*, 331 U.S. 752, 774-780, imply that the possibility of avoiding more than one trial at law by other procedural devices would make resort to equity unnecessary.[41] Judge Parker, for the Fourth Circuit, has noted explicitly that the flexibility of modern procedures for consolidation of causes, combined with other factors, has greatly lessened the scope of the doctrine of multiplicity in the federal courts; in *Broderick* v. *American General Corporation*, 71 F. 2d 864, 870 (C.A. 4), he stated:

> In the federal courts, however, the question is simplified by section 267 of the Judicial Code, 28 USCA § 384, which gives congressional emphasis to the rule that suits in equity shall not be sustained where a plain, adequate, and complete remedy may be had at law; by section 921 of the Revised Statutes, 28 USCA § 734, *which*

[41] "The grounds for relief to a single plaintiff which will deprive two or more defendants of their right to a jury trial must be real and substantial and its necessity must affirmatively appear. See *Boise Artesian Hot & Cold Water Co.* v. *Boise City*, 213 U. S. 276, 285, 286; *Dalton Adding Machine Co.* v. *State Corporation Comm'n*, 236 U. S. 699, 700, 701. Respondent's bill of complaint does not show that petitioners are unwilling to abide the result of a trial of one suit as controlling both; or unwilling to try first the suit in which they would be joint plaintiffs, or that in that case the judgment would not be *res adjudicata* in a subsequent suit, or in any case would not suffice to dispose of both; or that upon appropriate application the state court would not direct the trial of the controlling case first." [296 U. S., at 72.]

> *authorizes a consolidation of actions where they may reasonably be consolidated;* and by the Seventh Amendment to the Constitution, which requires the preservation in law actions of trial by jury. Whatever may be said in other jurisdictions as to the superior advantages of trying a number of actions at law as one suit in equity because some common question of law or fact is involved, there is little to be said in its favor in the federal courts *where the presence of such common question may furnish ground for consolidation*, so that even at law only one trial of the common question will be required. [Italics supplied]

The Eighth Circuit has held that the existence of a procedure for consolidation in a state court makes resort to equity inappropriate, saying (*Equitable Life Assur. Soc. v. Wirt*, 102 F. 10, 15):

> The plaintiff may compel the defendant to show cause in the state court why her actions should not be consolidated, and, if no such cause be shown, the several actions will be consolidated. § 20-703, Compiled Statutes of Nebraska, 1929. No reason is apparent to us why the actions brought by the defendant in the state court should not be consolidated, and, if they are consolidated, there is no practical necessity for enjoining their prosecution, since there would be then no multiplicity of suits and no unduly vexatious litigation.

That the doctrine of multiplicity may not be invoked when the cases in question can be consolidated

for trial is stated repeatedly in the exhaustive analysis in Pomeroy's treatise on *Equity Jurisprudence* (5th Ed., 1941),[12] which cites the authorities:

> Since the existence or exercise of the jurisdiction, in classes third and fourth, depends on defects in the legal rules as to joinder of parties, where the legal remedy is not thus defective, but permits the joinder of the numerous parties or consolidation of the numerous suits, equity will not take jurisdiction for the purpose of awarding substantially the same relief that may be obtained at law. [1 Pomeroy, 495]
>
> It should also be observed that if the pending actions at law are of such a nature or for such a purpose, that, according to the settled rules of the legal procedure, they may all be consolidated into one, and all tried together by an order of the court in which they or some of them are pending, then a court of equity will not interfere; since the legal remedy of the plaintiff is complete, certain, and adequate, there is no necessity for his invoking the aid of the equitable jurisdiction. [*Id.*, 506]
>
> In cases constituting the second branch of this class, the court *may* restrain numerous simultaneous actions against the plaintiff brought by the same defendant, all involving the same questions, for the purpose of having the whole decided by one trial and decree. The court will not interfere, however, when by the rules of legal procedure, all the actions can be consolidated by order of the court of law (see § 254). [*Id.*, 611]

[12] See to the same effect, McClintock on *Equity* (1936), 314

The treatise notes that in the cases in which courts have enjoined numerous prosecutions for violation of an invalid law, "the court [had] no power to consolidate the actions." *Id.*, at 507.

These authorities, holding that the multiplicity doctrine does not permit relief in equity when cases may be consolidated at law, were concerned with ordinary legal procedures for consolidating different cases. But their reasoning obviously applies when Congress has established a special and unusual procedure for consolidating a particular class of cases even when brought in many districts throughout the United States. See *Aircraft & Diesel Equipment Corp.* v. *Hirsch*, 331 U. S. 752, 774-781. For the provisions of Section 304 manifest both the Congressional awareness of the problem of multiplicity with respect to seizures under the Food, Drug, and Cosmetic Act, and the manner in which Congress intended to safeguard the competing interests of the public and the distributors of the products. Congress presumably did not regard the procedure which it so carefully devised as an inadequate remedy. Since this procedure enables the claimant of the libeled product to consolidate the cases for trial, there is no room for reliance upon the doctrine of multiplicity.[43]

[43] *National Remedy Co.* v. *Hyde*, 50 F. 2d 1066 (C.A. D.C.) does not support appellee's argument. That case was decided under the Food and Drugs Act of 1906, which did not afford a claimant the opportunity to consolidate multiple seizures, and hence no adequate remedy at law was available.

2. *Other injury.*

Appellee also claims, and the court below found (Fdg. 39, R. 769), that the seizures have caused irreparable injury by reason of (1) loss of morale among its agents and distributors, and a resulting drop in volume of sales; (2) the adverse effect of the publicity attending the seizures; and (3) loss of good will for the same reason. Such factors, which may accompany any legal proceeding in which a defendant is accused of wrongdoing, obviously do not furnish sufficient grounds for equitable intervention. *Aircraft & Diesel Equipment Corp.* v. *Hirsch*, 331 U. S. 752, 778-780.

The injury from the necessity for hiring counsel and defending the various libel proceedings relates to the problem of multiplicity and need not be discussed further. Appellee need do no more than file a single piece of paper in each district where a libel is pending, requesting consolidation and removal of the case for trial to one of the districts in which it is entitled to have the case tried.[44]

The court below also found that appellee would suffer irreparable injury because the value of the property seized amounted to $6,822; and because "the product so seized will be unsaleable if returned to [appellee]." (Fdg. 39, R. 769). The only evidence supporting the latter portion of this finding was that some of the vitamins in Nutrilite cap-

[44] It would even seem unnecessary to hire separate counsel in each district, since appellee could file a claim and application for consolidation in each case in its own name.

sules deteriorate with the passage of time, so that if there was "prolonged storage", such as a "year or so," there would be some "loss of potency."[45]

---

[45] The testimony of appellants' and appellee's witnesses on this point was not in conflict. Appellee's witness Truesdail stated in his deposition (R. 285-286):

Q. "Now, with your experience in the field of vitamins, biochemistry, and nutrition, do you have an opinion as to whether or not the lapse of time has any effect in the potency of a multiple vitamin product?"

A. "Yes, I do have an opinion on that."

Q. "What would your answer be?"

A. "Well, my answer would be that there would be a gradual loss of certain vitamin factors with prolonged storage of the product."

Q. "Would the length of time, the relative length of time, have an effect on the relative loss, that is, the longer the time, the more loss?"

A. "Yes, that would be true."

Q. "So that if a multiple vitamin product were kept without use, without being used, for a period of a year or so, you would expect to find loss of potency; is that correct?"

A. "I would expect to find some loss of potency over its original potency when it was made."

Q. "Now, do you and your laboratory have any policy with respect to the length of time that multiple vitamins should be kept on store shelves before used?"

A. "Only to the extent that we advise our clients in general to try and move their stock so that there will not be any on the shelves, if possible, any longer than six months. We feel that is a safety factor, and beyond that six months period there may be a substantial loss of certain of the more unstable vitamins."

Q. "Now, your statement to the effect that multiple vitamin products in your opinion should be moved to the consumer within six months, and I take it that means six months after compounding and manufacturing?"

A. "That is correct."

Q. "Do you apply that also to multiple vitamin products of similar nature to Nutrilite?"

A. "Well, we apply it to all vitamin products.

If appellee had proceeded promptly to consolidate the cases and request an early trial, and had been vindicated, the tablets would have been returned before their value had been impaired.[46] But, apart from that, and assuming harmful deterioration, the loss of value resulting from the fact that a product is subject to deterioration or is perishable (as must be the case for many types of food and drugs) is not a sufficient basis for departure from the statutory scheme.

D. The District Court Lacked Jurisdiction to Determine Whether Appellee's Labeling Was Misleading

The court below found that appellee's labeling was not misleading in any particular (Fdg. 12(f),

---

Q. "Including Nutrilite?"
A. "Including Nutrilite."

Dr. Elmer M. Nelson, a witness for the Government, testified (R. 487-488):

Q. Doctor, on the basis of your experience and the supervision of your laboratory, do you have an opinion as to the deterioration rate of properly encapsulated vitamin preparations?
A. I have.
Q. And what is that opinion?
A. If vitamins are properly encapsulated there would be no measurable deterioration of vitamin A, vitamin D, riboflavin, or vitamin B-2, or of nicotinic acid, in a period of a year or even in two years.
With respect to vitamin C and vitamin B-1, there is some deterioration even in the best made preparations, and those that the Army purchased—multivitamin preparations that the Army purchased during the war—some of them showed a deterioration of the order of 5 percent per year—about 10 percent in a period of two years.

[46] It is true that if an appeal was taken the tablets would be retained for a longer time. But whether such an appeal would be taken is, of course, entirely conjectural and not sufficient foundation for a claim of irreparable injury.

R. 759-760). This was the issue which the statute commits to the courts in which the libel proceedings are to be heard.[47]

Much of what has been said in the preceding sections serves to demonstrate that the court below lacked jurisdiction to try that issue. The argument in Point II(C) (pp. 65-74, *supra*) as to lack of jurisdiction as a court of equity is, of course, fully applicable to this phase of the case as well, and need not be repeated. For the right to consolidate the libel proceedings in itself provides an adequate remedy at law and makes unnecessary a determination in equity of the issues to be tried in the libel suits.

Only a few additional observations seem necessary.

The procedure established by Congress obviously contemplated that the question whether the labeling was misleading would be tried in the libel suits or one of them. The injury to the owner of the products which often results when multiple seizures are begun was to be alleviated by consolidation, not by resort to a suit for injunction in the District of Columbia.

Of some significance is the provision in Section 304(b) that "on demand of either party any issue of fact joined in any such case shall be tried by jury." The Government, as well as the claimant,

---

[47] The issue may also be determined, of course, in district courts in which the Government may institute other types of enforcement proceedings.

was thus given the right to insist on a jury trial. It is not difficult to think of circumstances in which the Government would consider that a jury, consisting of the type of persons to whom such representations are addressed, would be the proper tribunal for gauging their deceptive effect.

In addition, and perhaps of greatest importance, to permit the basic issue as to the deceptive character of the labeling to be decided in an injunction suit while the pending seizures were, at the command of the injunction court, held in abeyance, and while additional seizures were prohibited, would be inconsistent with the basic purpose of Section 304 to protect the public during the period of pendency of the seizure suits. The grant of a temporary injunction, as in the instant case, would reverse the policy which Congress deliberately adopted in the statute whereby, when it is believed that misrepresentation would be harmful to the public, the consumers and not the distributors were to be protected by seizure of the product in advance of trial.

III

If the District Court Had Jurisdiction to Determine Such Issues, It Should Have Found That the Facts Amply Support the Administrative Determination of Probable Cause and That Appellee's Labeling Is Misleading

If, contrary to our contention, the District Court had jurisdiction in the present case to review the validity of the administrative determinations that probable cause existed for believing that the labeling of appellee's product is materially misleading,

the scope of such review would, under settled principles governing judicial review of administrative action, be limited to an inquiry whether the determinations of probable cause, *Rochester Telephone Corp.* v. *United States*, 307 U. S. 125, 146; *National Labor Relations Board* v. *Hearst Publications*, 322 U. S. 111, 130-131; *Donaldson* v. *Read Magazine Co.*, 333 U. S. 178, 186; *Houston* v. *St. Louis Packing Co.*, 249 U.S. 479, 484-485 (no prior administrative record). We respectfully submit that the facts of record before the Administrator furnished ample support for the administrative findings of probable cause, and that the evidence adduced at the trial reinforced the correctness of the administrative determinations by proving that the labeling was in fact misleading.

Whether the labeling of appellee's product was misleading depended upon (1) the nature of the representations contained in such labeling, and (2) the truth or falsity of such representations. Each of the various officials who made the determinations of probable cause testified that his conclusion as to the character of the representations made on behalf of the product was based upon his own examination and analysis of the booklet "How to Get Well and Stay Well" (R. 315-326, 334-336, 374-378, 383-384, 395-405, 508-510, 512). These officials testified that they had found that the booklet represented to the average reader that Nutrilite would be effective in the prevention and cure of most common and serious diseases, which would

include such ailments as high blood pressure, heart and coronary disease, pneumonia, tuberculosis, and cancer (R. 326-327, 375-378, 396, 398-400). Having found such representations in the booklet, each official relied upon the findings of fact of his medical adviser that Nutrilite would not be effective in preventing or treating most such diseases and conditions (R. 313-315, 333-334, 395, 505, 512-514). Accordingly, each official concluded that he had probable cause to believe that the labeling would be in a material respect misleading to the injury or damage of the purchaser or consumer (Deft. Ex. 12, R. 1171, 314, 315-318; Deft. Ex. 13, R. 1173, 333, 334; Deft. Ex. 15, R. 1216, 408, 395; Deft. Ex. 23, R. 1532, 518, 509, 514).

To be sure, none of the officials had before him facts showing actual physical injury or damage to any particular purchaser or consumer (R. 330, 385, 406, 507). But each based his determination on the ground that there was probable cause to believe that many consumers and purchasers, relying upon the representations made in its behalf, would use Nutrilite to treat diseases for which it was ineffective as a preventive or cure (R. 315-319, 335-336, 376-378, 395-405, 509-510). It was also testified that, in some cases the labeling of appellee's product would cause delay in obtaining competent diagnosis and treatment for serious diseases, with perhaps irreparable damage to health (R. 318, 403-404).

The evidence presented by appellee did not seriously challenge the medical findings of fact upon which the probable cause determinations were made. Indeed, there was no substantial difference between appellee's medical witnesses and appellants' as to the basic medical facts. There was agreement that Nutrilite and vitamin products generally would be useful in helping persons suffering from dietary deficiency resulting from insufficient vitamins. (R. 86, 351, 373-374.) The medical evidence presented in the District Court was also essentially in accord as to the ineffectiveness of Nutrilite in the prevention and cure of the various specific ailments referred to above. The findings of fact submitted by Dr. Butz to the administrative officials were that a product containing the ingredients of Nutrilite would not be effective in preventing or treating most common diseases, and that most common diseases do not result from dietary deficiencies (Deft. Ex. 12, 13, 15, 23; R. 1171, 314; 1173, 333; 1216, 408; 1532, 518). This was confirmed not only by the statements of three medical doctors testifying for appellants (R. 342-343, 344, 348-350, 351, 354-360, 362, 364-365, 432-434, 437, 472-478), but by appellee's medical witness, Dr. John Myer, who admitted that, with regard to such illnesses and diseases, a vitamin and mineral product like Nutrilite could not be regarded as a specific preventive or cure, and that Nutrilite was useful only as adjunctive

therapy (R. 103, 106-107, 112, 113, 131-132, 163). Nor did the findings of fact made by the District Court contradict or challenge the medical findings submitted to the administrative officials as to the usefulness of Nutrilite in the prevention and treatment of common diseases. The crux of the District Court's findings relating to the lack of factual justification for the probable cause determinations is contained in Finding 12(e) (R. 759):

> (e) The three pamphlets (Pl's Exs. #1, 2 and 3), when read as a whole and fairly interpreted, without lifting statements therein out of context, do no more than represent that Nutrilite is a vitamin-mineral food supplement designed and intended to build up the bodies of human users thereof in order that it may aid nature to help the users enjoy better health through better nutrition. Said pamphlets do not represent to the minds of ordinary, reasonable and prudent persons that all of the symptoms, conditions and diseases of the human body necessarily or generally result from dietary deficiencies alone, or that all of the symptoms, conditions and diseases of the human body can be prevented, cured or treated by the use of Nutrilite, and said pamphlets do not represent, suggest, or imply that Nutrilite is a medicine or drug, or that it is efficacious or beneficial in the prevention, treatment or cure of all diseases.
>
> These pamphlets represent the product only as a food supplement containing vitamins and minerals beneficial to building up health and

> bodies and in alleviating, in some but not in all instances, symptoms resulting from vitamin and mineral deficiencies in the diet. Purchasers and consumers do not understand from these pamphlets that Nutrilite is a treatment or cure for any disease. * * *

It is clear from this passage that the court below did not believe that Nutrilite would be generally effective as a means of preventing or curing disease.

The District Court's objections to the probable cause determinations were based upon its view that the administrative officials were entirely unjustified in believing that any of the three editions of the pamphlet "How to Get Well and Stay Well" represented that Nutrilite had any such effect. Indeed, at various stages of the trial the members of the District Court strongly expressed their view that no reasonable man could read the booklet as containing any such representations (R. 115-117, 124-127, 149-150, 152, 161, 221, 242, 376, 381-382, 397, 400). A reading of the record will clearly show that this view of the District Court permeated the entire proceeding held before it.

The critical question is whether the administrative officials could reasonably have reached the opposite conclusion, that the booklets would deceive the consuming public. It becomes necessary, therefore, to analyze in detail the contents of the booklets.

The administrative officials testified that the booklet employed a familiar technique capitalizing on the average person's fear of death and illness. (R. 316, 334-335, 509). They regarded as significant the booklet attempt to make illness, malnutrition, and vitamin and mineral deficiency seem practically synonymous terms (R. 913-915), and the description of Nutrilite as a treatment for dietary deficiency disease, accompanied by the explanation that dietary deficiency disease is now being recognized in the newer branches of science as the root of the common ailments which result in premature death. (R. 323, 326, 330, 400-402). These officials knew also that, as Dr. John Myers, a witness for appellee, testified (R. 147), a person "would not be likely to buy an expensive preparation like Nutrilite" for a "simple" condition but only when "his condition got very much worse." They recognized the emphasis upon Nutrilite's "secret base" and its alleged extraordinary merit as characteristic of claims that were prevalent in the heyday of patent medicines and quack nostrums.[48] (R. 316, 334, 400).

---

[48] Compare *Secrecy in "Patent" Medicines,"* Journal of the American Medical Association, Nov. 3, 1917, reprinted in Vol. II, *Nostrums and Quackery*, 800 (Cramp Ed. 1921), where the following statement is made:

> "Practically every 'patent medicine' manufacturer leads the public to believe, either by direct statements or by implication, that his preparations possess some marvelous and esoteric powers—due either to a peculiar combination of well-known drugs or to the presence of some mysterious

The 58 page edition of the booklet involved in the first four libel proceedings unquestionably represented that Nutrilite was effective in the treatment of "severe abdominal pains" (R. 827), "splitting headaches" (R. 827), "terrific pains" in joints and hips (R. 827), "heart catches" (R. 827), "extreme fatigue" (R. 835), "sneezing and weeping" (R. 831), "nervousness" (R. 835), "tuberculosis" (R. 835), and "dizzy spells" (R. 836). These representations were in the form of testimonials given by persons who stated that they obtained relief through the use of Nutrilite. The administrative officials were entitled, on the basis of their experience, to conclude that representations in the form of such testimonials are most effective in impressing the average reader. In *United States* v. *John J. Fulton Co.*, 334 F. 2d 506, 507, the Court of Appeals for the Ninth Circuit observed that sales pamphlets containing such testimonials have "a more persuasive appeal to

---

drug about which the rest of the world is ignorant—not to be found in official products or in unofficial products made by competitors. Such claims, of course, are the sheerest humbug."

No evidence was offered as to the method of preparing the "secret base" of Nutrilite or as to its final composition. Claimant's expert witness testified that the base has something that makes it more valuable than ordinary vitamins and minerals (R. 87), but on cross-examination, while stating that the base contained something "specific" and "essential", he admitted that he did not know how the base was prepared or how it fit into the curative picture. (R. 163-164). The evidence offered in support of plaintiff's case dealt not with the base and its merits, but only with the beneficial effects of vitamins and minerals.

the credulity of sufferer from these diseases than if the representations thus implied were made directly upon the authority alone of the proprietors, and for that reason they are not less, but more, obnoxious to the law." [49]

As stated, *supra,* appellee revised its 58-page booklet, first by deleting therefrom pages 37-58, and later by issuing a new 42-page edition. Both the 36-page and the 42-page editions, while eliminating the testimonial material contained in the 58 page edition, contain numerous passages which the administrative officials correctly found to be representations on which "credulous persons", suffering from serious diseases would rely to their possible injury or damage "despite subtle qualifying phrases". Cf. *Reilly* v. *Pinkus,* 338 U. S. 269, 274. The booklet must be read in its entirety in order fully to appreciate its impact upon the average reader. The theme is simple and is developed in logical sequence, leaving the following impressions on the reader: [50] (a) Almost everyone in the

---

[49] The court below stated on several occasions (R. 149-152, 376, 382) that the representations in the testimonials could not be attributed to appellee and refused to permit appellants to cross-examine (R. 152) or introduce evidence (R. 382-383) for the purpose of developing their contention that the testimonials were deceptive. This was serious error.

[50] The following analysis is of the 42-page booklet (Pl. Ex. 3, R. 883-927). The 36-page booklet is almost identical with the first thirty-six pages of Pl. Ex. 3 (R. 844-882). However, on page 35, it includes a more direct statement of what is meant by "common diseases". The statement, which was eliminated from the 42-page edition, is (R. 881):

> Most of our common diseases, with the exception of germ diseases, but including some of the most painful,

United States is either ill or about to become ill, (b) almost every common illness, including those most responsible for premature death, is due to vitamin deficiencies, (c) the average American diet is deficient in certain vital food factors including both known and unknown vitamins and minerals, which are called "nutrilites" by biochemists, (d) to prevent and cure such illnesses, these food factors must be put into the body to bring it into chemical balance, for illness is merely the result of chemical imbalance in the body and health is the result of chemical balance, (e) to attain chemical balance, and thus to get well and stay well, one should use Nutrilite, which contains not only the known vitamins and minerals but also the unknown ones.

Pages 1 through 6 (R. 886-891) instill the seeds of fear. The reader is asked provocative questions (page 1):

"ARE YOU A VICTIM?"
"ARE YOU SUFFERING FROM HIDDEN HUNGER?"
"ARE YOU SLOWLY STARVING TO DEATH?"

He is asked to look around at the members of his family, his neighbors, friends and relatives, and himself. "Can you find even three or four who are

---

the most common causes of death from illness, those with the weirdest names, many rare diseases, and many which are considered incurable, are the result of dietary deficiencies."

The 58-page edition (Pl. Ex. 1, R. 783-843) is the 36-page edition plus 37-58. The later pages are largely comprised of testimonial material.

absolutely and completely well? Are you enjoying perfect health?"

"On the other hand * * * note how many are weak and lacking in energy, having trouble digesting their food or suffering with actual stomach pains, with decaying teeth, trouble with their hearts and other important organs, and with aches, pains and discomfort in various parts of their bodies. * * * And finally think of people you know, your age and younger, who have died in the last year, prematurely." On pages 1 and 2 (R. 886-887) the reader is asked to check himself against five criteria of good health. These are so defined as to insure that almost everyone will discover at least one respect in which he lacks good health. This section concludes: "Now—what do you think? How many of the people in your family meet these health requirements? How many of your friends measure up to these standards? Do you? Don't you think the facts point to the need for something?"

Page 10 (R. 895) continues the thesis that almost everyone suffers from a deficient diet and almost all illness results from such a deficiency. The booklet states that the "result is that almost all members of our families have bodies which are malnourished, and show evidences of the malnutrition which causes most of our common deficiency ailments." "Deficiency ailments" are defined as including "most of our current and common ail-

ments." (Page 11, R. 896). The purpose of the booklet is explained on page 10 (R. 895) as:

> So the purpose of this book—and the objective of the person who lent you this book—is to bring you to the point where you will recognize the fact clearly that *your illness and the illness of your family, is, in almost every case, the result of a failure to supply your body and the bodies of the members of your family with the vital food factors.* You must realize that if you wish to preserve your health and the health of your wife or husband, have healthy, happy children, fight off the common deficiency diseases yourself, and enjoy vibrant health and an active old age, YOU MUST PUT INTO YOUR BODY ALL THE FOOD FACTORS REQUIRED BY IT.
>
> This book tells you how to do this, and it supplies the answer to the enigma of modern medicine—why some people get sick so easily, and get well with such difficulty. [Italics supplied]

The term "nutrilites" in lower case is used to denote all the necessary food factors.

Pages 16-19 (R. 901-904) are devoted to a discussion of the functions of vitamins and their interrelation in preventing and treating diseases. On page 19 the "medical approach" to illness is described as consisting of combating those diseases which are caused by the entrance of foreign matter into the body "(germs and poisons, for example)". It is indicated that this "medical approach" is old-

fashioned. "The new facts are that many physical ailments and diseases are not the result of the penetration of the body by something foreign, but THE FAILURE TO PUT INTO THE BODY needed factors and materials, resulting in nutritional deficiencies." (Page 20, R. 905).

On page 20 (R. 905), it is stated that one can fight a particular disease with medicines or by "forgetting all about the symptoms and their medical names, and putting back into the body the materials the body needs for health. In this way, you are not fighting any foreign element in the body, or trying to cure anything. You are adjusting your diet so your body can restore itself to normal."

On pages 20 and 21 (R. 905-906), the reader is advised that whenever he has "an ache or pain, a weakness, wasting, unsatisfactory feeling, a lesion, a sympton, or loss of physical capacity—in short, when he is ill, there are three courses of action open * * *." The first course suggested is for the sufferer to add to his diet the essential food factors. "Then he can wait long enough to give the body a chance to rebuild, and see if that is all he needs." If the "physical ailment seems to be acute" the sufferer is advised in large capital letters to rebuild his body with nutrilites, and in small letters also to consult a physician. Page 21 (R. 906) states:

> This procedure should be acceptable to all concerned. First, if the ailment is chronic rather than acute, no harm can come from the use of the process of physical rebuilding through food and the nutrilites, since the ail-

ment has likely been plaguing the person for considerable time and the sufferer is still alive. A few months devoted to rebuilding the body can hardly make things worse.

A person following this advice will be likely to avoid seeing a doctor until an ailment becomes acute. With many afflictions, such as cancer, this will be too late even if "the sufferer is still alive." See R. 318.

Pages 23-40 (R. 908-925) are concerned with a discussion of the enemies of health, namely, depleted soil, improper cooking, processing, and storage and shipping delays which deprive the public of needed food elements—all designed to show that most persons are not properly nourished—and with the presentation of the apparently simple solution to this serious problem.

On page 28 (R. 913) appears this statement:

> * * * the result of diet deficiencies may show itself as one of the common or not so common deficiency diseases, including those most responsible for death in our 40's and 50's, whereas we should live in good health and vigor, and with full possession of our faculties, to the age of 90 or 100.

A ray of hope is offered on the same page:

> Chemical and biological sciences have established the fact of the chemical nature of the life process and that living things of all kinds must be in chemical balance to be normal. Most of the ills and diseases of human beings are un-

> necessary—they are the result of chemical starvation of our bodies for substances vitally necessary to life.

In short, the impression is given that "adverse physical conditions" (p. 28, R. 913) "most responsible for death in our 40's and 50's," no matter what their medical names, result from failure to obtain the nutrilites and thus to keep the body in "chemical balance". "When your body gets out of chemical balance, you are ill. When you get into chemical balance and stay there, you are well." (Page 30, R. 915.)

On page 33, after stating falsely (see page 92, *infra*) that a recent study shows that "only one in a thousand is not suffering from deficiency—from malnutrition", the booklet declares "either we are now experiencing some deficiency disease, or we are ready to come down with one." (R. 918)

On pages 39 and 40 the word "Nutrilite" in upper case is used for the first time. Here, at last, the solution is presented; all the essential food factors—even those that are unknown—are found in Nutrilite Food Supplement (R. 925):

> The sufferer with dietary deficiencies and deficiency ailments has the problem of getting into his body all the basic food factors which either were never in his food to start with or which have been partially removed in some way. If you are such a sufferer, how can these basic food factors be added to your food? We believe that NUTRILITE Food Supplement is at least one answer.

> The man, woman or child who is reasonably well, and who wishes to stay that way and if possible improve, has also the problem of keeping his body supplied with all the vital food factors. If you are in this group you too have a problem, in this civilized age of devitalized and imitation food. And here again, you can turn to—NUTRILITE Food Supplement.

Finally, the fourth edition of the booklet (but not the earlier ones), on its final page (page 42, R. 927), contains warnings that a food supplement only improves "your nutritional status", that "if there is any evidence that a doctor should be consulted, you should do so" and that "you may have other conditions that require the services of a physician, in which event you should consult a doctor immediately. It is a sound health rule to see your dentist twice a year and to have a regular periodic check-up by your physician."[51] This could hardly be expected to counteract all which preceded it.

The evidence adduced at the trial also proved that several material representations in the booklets were clearly false. Documentary evidence offered by appellants to show such falsity was not contradicted by appellee. Five specific instances may be cited:

(1) On pages 3 and 4 of the booklet is a fragmentary and incomplete quotation from a New York Times article for June 29, 1945, which in its

[51] The 58 and 36-page editions recommend that a physician be consulted only if the condition is acute (R. 805-806, 866-867).

context attributes to vitamin and mineral deficiencies the high rejection rate for women applying for the W.A.C. (R. 888-889). Defendants' Exhibit 4, a photostat of the article, shows the specific causes of rejection, which do not include vitamin and mineral deficiencies. (R. 1059, 234).

(2) On Page 4 of the booklet appears a statement that a survey by a large eastern college showed that only 2 out of 2511 persons studied in Pennsylvania were receiving the vitamins, minerals, and proteins they needed (R. 889). Defendants' Exhibit 17 is a copy of the official report of that survey conducted by the Pennsylvania State College (R. 1225, 456-457). It does not support the claim in the booklet (R. 457-458, 1247).[52]

(3) On Page 6 of the booklet appears the statement that 32% of draftees in World War II were rejected and that 52½% had some disability (R. 891). These statements are presented in a context which was intended to and does, in fact, force the reader to conclude that these rejections and disabilities are the result of vitamin and mineral deficiencies. Defendants' Exhibits 5, 19,

---

[52] The report states that "only two boys * * * were uniformly high in all of the tests given to them" (R. 1247). Examination of the report as a whole (R. 1225-1248) shows that the quoted passage does not by any means justify the appellee's assertion that all of the other persons covered by the survey "lacked the proper nutrition" and were "not receiving the vitamins, minerals and proteins they needed!" (R. 889). Appellee apparently relied upon an inaccurate newspaper summary of the report (R. 1249).

and 20 are copies of official selective service statistics on causes for rejections during World War II; vitamin and mineral deficiencies accounted for a very negligible percentage of such rejections. (R. 1061, 1250, 1391, 465, 1063, 1068-1074, 1086-1099, particularly 1098, 1264-1274, 1404-1411.)

(4) Pages 7, 8 and 9 of the booklet contain statements that Carl Rehnborg, the discoverer of Nutrilite, "majored in biochemistry in an eastern university"; that he "specialized in the chemistry of foods"; that he took part in "early vitamin research experiments"; and that he "returned to the United States in 1927" and "began a six-year period of intensive study and experimentation." (R. 892-894). Defendants' Exhibit 24, a stipulation concerning the education and background of Carl Rehnborg, proves conclusively the falsity of these statements (R. 1542, 520).

(5) Page 11 of the booklet explains that common deficiency ailments include most of our current and common ailments (R. 896). Page 28 claims that "common deficiency diseases" include the diseases "most responsible for death in our 40's and 50's." (R. 913). Defendants' Exhibit 25 gives the leading causes of death from 1945 to 1947 as diseases of the heart, cancer, tuberculosis, pneumonia, nepliritis, diabetes, and intracranial lesions of vascular origin. (Deft. Ex. 25, R. 1543-1545, 529. Vitamin deficiency diseases accounted for only 973 out of 1,445,370 deaths reported in 1947. (R. 1551).

Exhibit 26, which would have shown that the same was true for deaths of persons in the 40's and 50's, was excluded by the court below (R. 529-530).[53]

This summary and analysis of the representations contained in the booklets, in the light of the conceded medical facts as to the inability of Nutrilite to cure or prevent most common diseases, demonstrate that the booklets were designed to give readers a false impression that Nutrilite would prevent or cure all but acute ailments, and that almost everyone needed it in order to avoid a dietary deficiency. There was thus ample basis for the determinations made by the administrative officials that they had probable cause to believe that the labeling was materially misleading. The officials were not required to find that every statement was literally false. The statutory standard which they applied, and properly so, in making their determinations, has been defined by this Court in *United States* v. *95 Barrels * * * Vinegar*, 265 U. S. 438, 442-443, as follows:

> The statute is plain and direct. Its comprehensive terms condemn every statement, design and device which may mislead or de-

---

[53] Such official statistics would seem in any event to be judicially noticeable. They show that the proportion of deaths in the 40's and 50's resulting from vitamin deficiency diseases was insignificant. See "Vital Statistics—Special Reports, National Summaries—Death and Death Rates for Selected Causes by Age, Race, and Sex, United States, 1947. Volume 31, Number 11."

> ceive. Deception may result from the use of statements not technically false or which may be literally true. The aim of the statute is to prevent that resulting from indirection and ambiguity, as well as from statements which are false. It is not difficult to choose statements, designs and devices which will not deceive. Those which are ambiguous and liable to mislead should be read favorably to the accomplishment of the purpose of the act.

This principle was reaffirmed by this Court in *Donaldson* v. *Read Magazine*, 333 U. S. 178, 188-189, in which the Court stated:

> Advertisements as a whole may be completely misleading although every sentence separately considered is literally true. This may be because things are omitted that should be said, or because advertisements are composed or purposefully printed in such way as to mislead. * * * Questions of fraud may be determined in the light of the effect advertisements would most probably produce on ordinary minds. * * * People have a right to assume that fraudulent advertising traps will not be laid to ensnare them. "Laws are made to protect the trusting as well as the suspicious." *Federal Trade Comm'n* v. *Standard Education Society*, 302 U. S. 112, 116.

If the booklets be tested in the light of these standards, there can be no question that they are materially misleading. And since the result might be to induce consumers to use Nutrilite for symp-

toms of common diseases as to which delay in effective treatment might be dangerous, if not fatal, it is clear that the misbranding would be injurious to consumers.

With respect to the lawfulness of the finding of probable cause—if it is reviewable at all—the only question is whether the administrative finding is one which could be made by a reasonable man, not whether the court would reach the same decision. We submit that the evidence more than satisfies this burden. Indeed, the record demonstrates as a matter of fact that the booklets were unquestionably misleading. Consequently, even if this Court should conclude that the ultimate issue as to the character of the labeling is before it, i. e., whether the "labeling is false or misleading in any particular",[54] we submit that it should hold that the labeling is misleading and that the conclusion of the court below to the contrary is clearly erroneous.

Appellee's good faith, if any, is irrelevant. One further matter deserves discussion, since it apparently misled the court below and influenced both its decision and its rulings on evidence to a substantial degree. The court below concluded that appellee acted in good faith in preparing and using the pamphlet (Fdg. 12(f), R. 759-760). Even if

---

[54] Federal Food, Drug and Cosmetic Act, Sections 403(a), 502(a), 21 U.S.C. Sec. 343(a), 352(a). Only in reference to the preliminary finding of probable cause does the statute impose a more stringent standard and require that misbranding be "in a material respect misleading to the injury or damage of the purchaser or consumer" (Section 304(a), 21 U.S.C. 334(a)).

true, this was irrelevant. As the passage quoted at page 56, n. 32, *supra*, from the House Committee Report demonstrates, Congress deliberately eliminated intent as an element for this type of offense. This Court squarely so held in *United States* v. *Dotterweich*, 320 U. S. 277, 281, saying:

> Such legislation dispenses with the conventional requirement for criminal conduct—awareness of some wrongdoing. In the interest of the larger good it puts the burden of acting at hazard upon a person otherwise innocent but standing in responsible relation to a public danger. *United States* v. *Balint*, 258 U. S. 250. And so it is clear that shipments like those now in issue are "punished by the statute if the article is misbranded [or adulterated], and that the article may be misbranded [or adulterated] without any conscious fraud at all. It was natural enough to throw this risk on shippers with regard to the identity of their wares . . ." *United States* v. *Johnson*, 221 U. S. 488, 497-98.

Apart from this, and despite the holding of the court below, we submit that appellee's good faith is highly questionable. It is true that whenever apprised of the fact that the Food and Drug Administration was investigating its practices, appellee consulted counsel, sought to confer with officials of the Administration, and toned down the exaggerations contained in its booklets. But this does not manifest good faith, but merely an attempt to

keep out of trouble. The original booklet, upon which the criminal prosecution was based (Def't. Ex. 7, R. 1104, 298), represented much more affirmatively than the later versions that Nutrilite would prevent and cure serious diseases. See pp. 6-7, *supra*. It seems highly unlikely that these representations could have been made in good faith. Appellee's repeated modifications of the booklet, without ever changing the impression which it was designed to make on the average consumer, shows merely that appellee was seeking to avoid prosecution by the Government, not to be honest and above-board in its dealings with the public.

IV

Reversible Error Was Committed by the Court Below in Limiting Cross-Examination and in Ruling on the Admission and Exclusion of Evidence and on Appellee's Rights to Pre-Trial Discovery.

We have argued that the District Court lacked jurisdiction to review the findings of probable cause or to determine for itself whether appellee's labeling was misleading, and also that in any event the testimony of record demonstrates that the administrative finding was adequately supported and that the labeling was misleading. Only if the Court should decide all these contentions adversely to the Government will it be necessary to deal with the errors committed by the District Court in the course of the trial.

Some of these errors have a significant bearing upon the decision of the factual questions for sev-

eral reasons. Thus, to the extent that cross-examination was improperly restricted and evidence offered by appellants excluded, the record considered by the court below was deficient. This Court cannot know what would have appeared in the record if cross-examination had not been limited. The improper restriction of cross-examination is a recognized ground for reversal. *E.g., Reilly* v. *Pinkus*, 338 U. S. 269.

1. *Curtailment of Cross-Examination.* The trial court unreasonably restricted the cross-examination of Casselberry and Dr. John Myers, the principal witnesses for the Company. They were allowed on direct examination to express broad opinions as to what the booklets convey to the public, and to say, without discussing any specific parts of the labeling, that there are no false or misleading claims made in the booklets (R. 51-53, 85-86). This type of direct examination enabled the witnesses in very brief testimony to vouch for the truth of all statements made in the 136 pages of printed matter that comprised the three editions of "How to Get Well and Stay Well."

Both in order to determine the meaning of the representations in the booklets and to test the veracity and candor of the witnesses' testimony that the booklets were in no way misleading, appellants sought to cross-examine Dr. Myers and Casselberry at length by confronting them with a great many passages from the booklets and eliciting the wit-

nesses' understanding of them. It is not at all inconceivable that if forced by vigorous and persistent cross-examination to justify a great many of the statements in the booklets, such as those quoted in the preceding Point, their testimony would have been discredited. Only through such an examination, which the court below did permit, was Dr. Myers compelled to express his understanding of such phrases used in the booklets as "common illnesses" (R. 94-95), "common diseases" (R. 96-122) and the like, and to concede that in all of the "common diseases" he had mentioned, vitamin pills alone would not help or cure (R. 112, 127), that Nutrilite would not cure any of the common diseases (R. 106-107), that he was unable to name any common dietary deficiency diseases that cause death in the 40's and 50's (R. 133-139), that if common symptoms were treated with Nutrilite it would be useless unless, as sometimes may happen, those symptoms in the particular case were due to vitamin deficiencies (R. 145-148), and that he treats no specific disease with Nutrilite (R. 163).

The court refused to allow further cross-examination of Dr. Myers with respect to the accuracy of the statements in the booklets on the ground that further questioning would be repetitious and that the cross-examination had already taken much too long (R. 169, 173, 181-183). But the subject to be explored was a difficult and important one—and the right to explore it had not been lost by the prolonged questioning necessary to get truthful

and adequate answers on another subject. The court also refused (R. 151-152) to permit cross-examination as to the testimonials found in the 58-page booklet (Pl. Ex. 1, R. 783, 272), because of its erroneous view (see pp. 83-84, *supra*) that false impressions conveyed in testimonials quoted by appellee could not be attributed to appellee.

The cross-examination of Casselberry was similarly curtailed. Although Casselberry had testified on direct-examination "positively that they are not false and misleading" (R. 231),[55] Judge Clark ruled that his testimony could not be challenged through cross-examination upon identified statements in the booklets because it was up to appellants to disprove Casselberry's statements as a part of their own affirmative case through their own witnesses but not through cross-examination, because the examination was argumentative, and because the booklets as written documents spoke for themselves (R. 231-233).[56] The forbidden cross-exami-

---

[55] The quotation is from Judge Clark's characterization of Casselberry's testimony.

[56] In order that the record might indicate the scope of the cross-examination contemplated, counsel for appellants stated his intention to go through the entire booklet in an attempt to have the witness explain the purposes of the many statements therein regarding diseases (R. 232). The court admonished counsel to desist and stated: "The Court will sustain objections to any such questions. You can embody them in an offer of proof if you want to" (R. 232). The court refused to allow counsel to identify for the record the passages in the booklet as to which he wished to inquire, stating: "The Court is not going to waste time letting you go through the booklet. You can make your offer of proof in writing and the Court will consider it." (R. 233). But when the written "offer of proof" was presented, the court rejected it on the

nation might well have undermined the direct testimony of appellee's two main witnesses, as well as basic claims as to the meaning of the booklets. Unless this Court is of the view that the booklets themselves so clearly prove their own innocence that no evidence at all with respect to their meaning and purpose was admissible, this was serious error, for it went to the heart of the case. And in any event the subject should not have been open to appellee's counsel on direct examination but closed to appellants' on cross-examination.

The right to full and complete cross-examination of adverse witnesses is essential to a fair trial. *Alford* v. *United States,* 282 U. S. 687; *District of Columbia* v. *Clawans,* 300 U. S. 617; *Reilly* v. *Pinkus,* 338 U. S. 269. We respectfully submit that the trial court abused its discretion in limiting and cutting off proper cross-examination.

2. *Objections at Trial to Questions Propounded in an Oral Deposition.* The court ruled, over appellants' objection, that the appellants were precluded from objecting to testimony contained in the deposition of Lee Myers because objection had not been saved at the time the deposition was taken (R. 252, 254). This was directly contrary to Rules 26(e) and 32(e)(1) of the Rules of Civil Procedure.

---

ground that the questions had not been asked orally and passed upon by the court (R. 520-528). And though Casselberry was then present, the appellants' request that he be recalled so that the questions in the offer of proof might be asked orally, and a separate ruling obtained on each question, was denied (R. 527-528).

Rule 26(e) provides that objection may be made at the trial to the receipt in evidence of any deposition or part thereof which would require its exclusion if the witness were then present and testifying. And Rule 32(c)(1) provides:

> Objections to the competency of a witness or to the competency, relevancy, or materiality of testimony are not waived by failure to make them before or during the taking of the deposition, unless the ground of objection is one which might have been obviated or removed if presented at that time.

The court, without suggesting that it was acting under the last clause quoted, ruled that appellants' objections at the trial were too late. Cf. *Laird* v. *United Shipyards* (S.D. N.Y. 1941) 1 F.R.D. 772.

3. *Exclusion of Official Statistics Showing Causes of Death.* The trial court excluded Defendants' Exhibit 26, an official publication entitled "Vital Statistics—Special Reports, National Summaries—Death and Death Rates for Selected Causes by Age, Race, and Sex: United States 1947, Volume 31, Number 11" (R. 529-530). The court had previously admitted a similar report (Deft. Ex. 25, R. 1543, 529) which differed mainly in that it did not show causes of death by age groups, but, according to Judge Clark, this was admitted "in the interests of saving time" and "because it has no probative effect one way or the other" (R. 528-529). Exhibit 26 was relevant to the claims made

in "How to Get Well and Stay Well" that diet deficiencies were causes of premature death, and that common deficiency diseases are among the diseases "most responsible for death in our 40's and 50's." (R. 913.)

The exhibit was excluded because the court assumed without reading it that it was "a self-serving declaration" (R. 529), in that it was a publication of the National Office of Vital Statistics, Public Health Service, a constituent of the Federal Security Agency. But there is no circumstance that makes the data untrustworthy in this action. Certainly there is no reason to believe that the pendency of the present case gave the Federal Security Administrator cause to direct the publication of untrue vital statistics.

In any event it has long been settled that official public records of this type are admissible. Cf. *Evanston* v. *Gunn,* 99 U. S. 660, 666. These statistics are required by law to be compiled and published. 13 U.S.C. 101 and 42 U.S.C. 245. It obviously was impossible for the appellants to prove the causes of the 1,445,370 deaths reported in the publication by any more satisfactory means.

4. *Erroneous Admission and Exclusion of Medical Writings.* Appellants offered in evidence a medical publication entitled "Deficiency Diseases in the Cincinnati Hospital; a Ten Year Study" (R. 425), through its author, Dr. Marion A. Blankenhorn, an outstanding medical expert in the

field of nutrition (R. 422-425). This article was highly relevant as a means of showing that dietary deficiency diseases, such as were emphasized in appellee's booklets, are rare to non-existent at the present time. The article was excluded as hearsay (R. 425-426), although the author was on the witness stand and subject to cross-examination (R. 425). It is well established that a learned treatise is admissible in evidence if its author is present and subject to cross examination. Wigmore, *Evidence*, 3rd Ed., § 1690 and cases cited; *La Count* v. *General Asbestos and Rubber Co.*, 184 S. C. 232, 241-242, 192 S. E. 262, 266-267; *Brown* v. *Inter-State Business Men's Assoc.*, 57 N. D. 941, 943-944, 224 N. W. 894, 895; *Rudd* v. *Hendrickson*, 176 Minn. 138, 222 N. W. 904. This was error.

The court admitted in evidence, however, a compilation of excerpts from medical publications, when offered through appellee's witness Casselberry, who was not a physician. This was admitted to show appellee's good faith, a factor which Congress clearly made irrelevant in the Food, Drug, and Cosmetic Act (R. 50, but see R. 219). See pp. 96-98 *supra*. Such excerpts, so introduced, clearly were inadmissible to prove the truth of the facts asserted. *United States* v. *One Device* * * * Colonic *Irrigator*, 160 F. 2d 194 (C. A. 10); *Union Pacific Railway Co.* v. *Yates*, 79 Fed. 584 (C. A. 8).

5. *Inconsistent Rulings as to Testimony of the Effect of the Booklets upon the Public.* The court

permitted two of appellee's witnesses, Attorney Myers and Dr. Myers to express opinions as to the impression the labeling would leave with the public (R. 85, 258-259). Even the doctor obviously had no special expertise as to the impression which the booklets would make on minds not medically trained. But the court held Mr. Crawford, Associate Commissioner of Food and Drugs, and an expert of many years' experience in food and drug regulation for the protection of consumers, incompetent to testify regarding such impression (R. 382-383).

6. *Inconsistent Rulings as to Testimony on Medical Facts.* The court below permitted Casselberry and Attorney Myers, both of whom were without qualifications as experts in the field of nutritional disease, to offer expert testimony as to medical facts (R. 32-35, 37, 50, 258). This also was error. Recognizing the rule that a determination of the competency of an expert lies within the sound discretion of the trial court (*Clarke* v. *Hot Springs Elec. Light & Power Co.*, 55 F. 2d 612 (C. A. 10)), certiorari denied 287 U. S. 619, we believe it a clear abuse of discretion to accept expert medical opinion testimony from witnesses who qualify only as attorney and psychologist.[57] Only those persons with

[57] Casselberry holds B.A., M.A., and Ph. D. degrees. His experience has been that of credit manager, real estate salesman, teacher, research worker for delinquent boys, vocational counselor, and consulting psychologist. His doctoral thesis was "Symptomatic Factors in Delinquency" (R. 32, 183-186).

training and experience in medicine or nutrition are competent to give expert opinion testimony as to the medical facts within those specialized fields. Cf. *Spring Co. v. Edgar*, 99 U. S. 645; *Aetna Life Ins. Co. v. Kelley*, 70 F. 2d 589, 592 (C. A. 8); and *United States v. McCreary*, 105 F. 2d 297, 299 (C. A. 9).

The court refused, however, to allow Dr. Elmer M. Nelson, Chief of the Nutrition Division, Food and Drug Administration, who was not a medical doctor but was an expert in the field of nutrition, to make comparisons between the daily dosage of Nutrilite and the minimum daily requirements for the several vitamins and minerals contained therein as established pursuant to law by the Federal Security Administrator (R. 488-490). This testimony was excluded both because Dr. Nelson was not a physician, and because "The Food and Drug Administration is on trial in this case, and it doesn't seem that their standards ought to be taken as the standards of scientific research" (*ibid.*).

Plaintiff's Exhibit 7 (R. 100, 51), which Casselberry (R. 51) and Attorney Myers (R. 249) said was a part of the material relied upon in the revision of the labeling, is a copy of a final order promulgated by the Federal Security Administrator establishing labeling statements required to be made on food for special dietary uses. 21 C. F. R. Section 125. Finding 12 (a) (R. 758) is based in part upon this administrative order. But

appellants were not allowed to show the relationship between Nutrilite and the standards set forth in the regulation, and thus to rebut the appellee's claim of reliance upon the regulation.

7. *Error in Allowing Discovery of Administrative Records and Interrogation of Administrative Officials.* The court erred in denying appellants' motion to quash subpoenas *duces tecum* served in connection with the oral interrogation of the Federal Security Agency defendants.[58]

The motion to quash raised two basic points: whether the administrative officials properly could be interrogated as to the details of their decisional processes, and whether the appellee could require the appellants to deliver to it all of the records of the Food and Drug Administration relating to the Company, its predecessors, and the manufacturer of Nutrilite without showing good cause under Rule 34.[59] (R. 746).

---

[58] This question, though important, could not have been presented to this Court at any earlier time.

[59] None of the reasons advanced by appellees or the court below constituted "good cause". The hearing on the motion was held on April 19, 1949, before Judge Clark. Counsel for appellee justified the all-encompassing coverage of the subpoena by insisting that he did not know what was contained in the Government's files (R. 672-675); that he "would like to know so we can meet it at the trial" (R. 675); and that "it might give me a lot of leads to the oppressive things they have done, why they have done them, and who is back of them" (R. 676). Judge Clark said that this case "is outside of the general rule" (R. 673); that though depositions of administrative officials were pending, "they . . . [are] entitled to have the basis of what the oral depositions would probably be" (R. 673); and that they "cannot know . . . what they want to find" (R. 673). He concluded that ap-

United States v. *Morgan*, 313 U. S. 409, 422, holds that it is not the judicial function to probe the mental processes of the administrative officials. Cf. *De Cambra* v. *Rogers*, 189 U. S. 119, 122.

And *Hickman* v. *Taylor*, 329 U. S. 495, holds that discovery has necessary boundaries, which under Rule 34 is a showing of good cause. See *Alltmont* v. *United States*, 177 F. 2d 971 (C. A. 3) and *North* v. *Lehigh Valley Transit Co.*, 13 Fed. Rules Serv. 26 b. 211, Case 5 (E. D. Pa.). The trial court completely disregarded the rule in denying the motion to quash.

These are the most prominent of the trial errors which we believe were committed in the course of the proceeding below. Only a reading of the entire record, however, can give the court a really accurate impression of what transpired.

It may be that the Court would not regard any one of these errors as in itself sufficiently important to require reversal of the judgment below. In their cumulative effect, however, they seriously prejudiced the defense of this case in the trial court.

---

pellee had a "right of deposition to discover the position of the government and to determine whether the reports on which the government has operated is relevant or not . . ." (R. 678), and that appellee is "entitled to look at all the documents in the discovery process . . ." (R. 679).

CONCLUSION

For all of the above reasons the judgment below should be reversed, with directions to dismiss the complaint.

Respectfully submitted,

PHILIP B. PERLMAN,
Solicitor General.

JAMES M. MCINERNEY,
Assistant Attorney General.

ROBERT L. STERN,
PHILIP ELMAN,
Special Assistants to the Attorney General.

VINCENT A. KLEINFELD,
Attorney, Department of Justice.

In the Supreme Court of the United States

OCTOBER TERM, 1949

No. 568

OSCAR R. EWING, FEDERAL SECURITY ADMINISTRATOR, ET AL., APPELLANTS

v.

MYTINGER & CASSELBERRY, INC., A CALIFORNIA CORPORATION

ON APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

REPLY MEMORANDUM FOR APPELLANTS

The brief filed by appellee contains a great many inaccurate, half-accurate and misleading statements, some of which relate to possibly significant aspects of the case although most do not. In their totality, however, these misstatements may result in leaving a very erroneous impression of what actually occurred. Accordingly, it seems desirable to call the Court's attention to a number of such

statements both in order to set the facts straight in part and to show the general unreliability of appellee's brief.

1. *Reference to wrong section of bill.* The Government argued in its brief that the deletion from a part of the bill which became the Food, Drug, and Cosmetic Act of a provision for injunctions against multiple seizures was one of the factors which suggested that Congress did not intend the district courts to grant such injunctions (Government's main brief, pp. 53-54, 58). Appellee asserts (Br. pp. 6, 140-142), that we failed to quote a passage from a House Report which refutes this contention Appellee has not noted, however, that the passage to which it refers relates to an entirely different provision of the bill.

Our brief was concerned with the section of the bill specifically authorizing the district courts to restrain multiple seizures—the last paragraph (first (g) and then (f)) of Section 711). See S. 5, 74th Cong., as reported to Senate March 22, 1935, Dunn, *Federal Food, Drug, and Cosmetic Act*, p. 234. This paragraph was deleted by the House Committee, as indicated in our main brief. See Dunn, pp. 529, 558. Appellee's brief (pp. 139-140) refers to Section 702 of S. 5, the general judicial review provision. It was this general provision, which had novel features, which the same House Report eliminated, with the statement (quoted at pp. 141-142 of appellee's brief), that no new remedy

was necessary and that the remedy in equity would be available to correct unlawful and arbitrary administrative action. Subsequently a different provision for review of regulations by district courts was reported to the House as Section 701(f). (S. 5, 75th Cong., 3d Sess., as reported April 14, 1938, Dunn, p. 810), which in turn was superseded by the present Section 701(f), which provides for review by courts of appeals.

The history of the specific provision which would have allowed injunctions against multiple seizures, with the full quotation from the Committee report as to the reason for its deletion, is accurately set forth at pages 53 to 54 of the Government's main brief.

2. *Improper use of interrogatories.* In stating the "facts" of the case, and throughout its brief, appellee has treated its own answers to written interrogatories as evidence which must be taken to be true because offered by the appellants (appellee's brief, especially pp. 13-18, 24-27). Its excuse for this is that at the close of the trial counsel for appellants asked to have the written interrogatories asked of appellee and the answers thereto "read into the record" (R. 530-531).

Even if this be regarded as an introduction of the interrogatories as evidence—which it does not appear to be—it would not convert appellee's colorful accusations into facts, admitted or otherwise. For, as appellee's brief fails to state, the long list of

answers upon which it relies (Br. 24-26, 15-18, 52) were merely responsive to the question (R. 531):

> (1) In what way *is it claimed by you* that these defendants or any of them have abused their power in violation of the due process clause of the Fifth Amendment? [Emphasis added.]

Appellee's answer to this question merely presented a statement of appellee's claims, as in a bill of particulars.[1] Introduction into the record of the question and answer together would admit at most that such were appellee's claims, not that the claims were factually true. Obviously, the Government was not, by the process of reading the question and answers into the record, admitting such charges as that it had rendered "three secret unlawful decisions in September and December 1948, that the labeling of plaintiff's product was misleading" (R. 532). The answers to the interrogatories are replete with legal conclusions and argumentative characterizations—"secret", "deliberate", "arbitrary", "unreasonable", "untrue", "oppressive" —which are not supported by any evidence in the record.

Apart from the fact that the answers on their face stated claims, not facts, such self-serving statements and conclusions would not have been binding upon the adverse party in any event. Federal Rule

---

[1] Appellants were seeking merely to determine what issues they would be required to meet at the trial. Cf. *Hickman* v. *Taylor*, 329 U.S. 495, 501.

of Civil Procedure 33, as amended in 1946, provides that answers to interrogatories "may be used to the same extent as provided in Rule 26(d) for the use of the deposition of a party". Rule 26(d)(2) permits the use against a party of his deposition or that of an officer of a corporation which is a party. Rule 26(f) then provides:

> (f) EFFECT OF TAKING OR USING DEPOSITIONS. A party shall not be deemed to make a person his own witness for any purpose by taking his deposition. The introduction in evidence of the deposition or any part thereof for any purpose other than that of contradicting or impeaching the deponent makes the deponent the witness of the party introducing the deposition, *but this shall not apply to the use by an adverse party of a deposition as described in paragraph (2) of subdivision (d) of this rule.* At the trial or hearing any party may rebut any relevant evidence contained in a deposition whether introduced by him or by any other party. [Italics supplied.]

See 6 Cyc. Fed. Proc. (2d Ed.) § 2558.

Obviously the answer to an interrogatory by one party, by whomever introduced, is not to be treated as an admission by his adversary, any more than the use by one party of the deposition of another. Although Rule 33 does not specifically state that interrogatories are controlled by Rule 26(f) as well as by Rule 26(d), the same principle must obviously govern.

For these reasons the assertions of appellee's claims in its answer to appellants' interrogatory is not evidence of anything, and if it were it would not be binding upon the adverse party. To the extent that appellee's statements are not supported by references to *evidence* in the record, as distinct from these interrogatories, they should be disregarded.

3. *Misstatements as to availability of Kingsley and Butz.* Appellee asserts that the Government's two "most essential" witnesses, Acting Administrator Kingsley and Dr. Butz, who testified by deposition, were not shown to be unavailable[2] at the time of the trial. (Appellee's brief, p. 20). The attempted implications are not only that the depositions were improperly admitted but that the Government was afraid to call them as witnesses. A comparison of appellee's statements with the record is revealing:

Appellee's Brief	*Record*
p. 20 "But Kingsley was not called as a witness and was not claimed to	R. 516-518. In a colloquy as to whether Kingsley's deposition was par-

[2] Kingsley's deposition was introduced not only because Kingsley was in Europe at the time of the trial but because appellee had read part of his deposition into the record (R. 269-270), which in itself made it proper for appellants to introduce the remainder. See Federal Rule of Civil Procedure 26(d)(4).

Appellee's Brief

be unavailable to Appellants * * *."

Record

tial or complete, the following occurred:

"MR. KLEINFELD: It isn't partial. This is the deposition that Mr. Rhyne took. He never asked us to go any further. Mr. Kingsley was available that day up to the time he left the country.

* * *

"MR. RHYNE: * * * The only time it was ever discussed between counsel after that was when Mr. Kleinfeld, when this matter was originally scheduled for trial, asked that I waive the personal appearance of Mr. Kingsley and I didn't do it. Since then they advised me that he was in Geneva.

"MR. KLEINFELD: That is right.

"MR. RHYNE: And I believe that is all the information I have on it, and because of that

visit, I haven't tried to complete the deposition.

* * *

* * *

"Those are the dates involved. So several months intervened between the time the records were made available and Mr. Kingsley left the country.

"MR. KLEINFELD: Mr. Rhyne has never asked at any time to take a further deposition of Mr. Kingsley. If he had, we would very gladly have put Mr. Kingsley at his disposal."

It was also public knowledge that Mr. Kingsley had been elected Director General of the International Refugee Organization, with head-

Appellee's Brief *Record*

quarters at Geneva, and that he was to assume duties on July 31. *New York Times,* July 9, 1949, p. 4, columns 3-4; *Washington Post,* July 9, 1949, p. 7, columns 1-2.

p. 20 Appellants "* * * then advised the Court. that they *would not* call Butz as a witness (R. 391-392) although his address is given in a deposition taken for discovery purposes as Silver Spring, Maryland (R. 1175), and they did not say that he was unavailable to them as a witness. * * *"

R. 366:

"MR. GOODRICH: Your Honor, as I started to say, we told Mr. Rhyne that Dr. Butz had transferred from our organization into the Department of the Army, and is now not in Washington.

"The last time we heard from him, he was in Brook General Hospital in San Antonio, Texas."

4. *Misconception of Dr. Butz's function.* Appellee asserts that the findings of probable cause by the various administrative officials were based solely on Dr. Butz's findings. But the evidence shows that in coming to their conclusions, Crawford, Dunbar, Larrick and Kingsley also relied on their own consideration of appellee's booklets to determine what claims were made. (See Government's main brief, pp. 17-21, and pp. 15-18, *infra*). The attack on Dr. Butz and the importance attributable to him manifest appellee's

misconception—as well as that of the court below—as to the function of the medical officer in making the finding. It was his duty to inform his superiors as to the medical facts, i.e., what a product containing the ingredients of Nutrilite would or would not do. He found that such a product "would not be effective in preventing or treating most common diseases" (R. 1172), a fact which we do not understand appellee to dispute, and which is unquestionably true whether they deny it or not.

After receiving Dr. Butz's findings, the administrative officials personally examined the booklets to determine whether the appellee was representing to the public that Nutrilite would be effective in preventing or curing most common diseases. The decision as to what impression the booklets would make on the reader, a non-medical question and apparently the primary question in dispute, was not committeed to Dr. Butz.

5. *Appellee's concession of no general curative effect confirms Dr. Butz.* Appellee asserts (Br. p. 80) with respect to Dr. Butz, that "when his deposition was taken he very definitely repudiated many of the statements in the findings attributed to him (R. 762)."[3] A reading of Dr. Butz's testimony (R. 1175-1215) will demonstrate the error

[3] The finding cited (R. 762) states merely that "In the deposition he repudiated some of the statements in said findings." Although this, in itself, is erroneous, it does not support appellee's substitution of the word "many" for the word "some" used by the court.

in this contention.[4] But in any event, since Dr. Butz's ultimate finding was that Nutrilite would not prevent or cure most common diseases, a finding not retracted or refuted in the slightest, and since appellee and its witnesses have not claimed to the contrary in this litigation, the point seems academic. The following excerpts from the record and appellee's brief should be sufficient to show appellee's position:

> Dr. John A. Myers, appellee's medical witness (R. 106-7):
>
> A. There are many common diseases. Once they have been precipitated we do not offer to alleviate them. Vitamin deficiency disease is preventive medicine, not curative medicine. As we have mentioned all the way through the book, it does not effect a cure.

---

[4] In the court below appellee argued that Dr. Butz's first finding that Nutrilite "would not be effective in the treatment of" a long list of ailments had been impeached by his admissions that, when a patient had a vitamin deficiency, Nutrilite might be helpful in dealing with some of the ailments listed (e.g. R. 1214-1215), and that symptoms listed sometimes manifested a vitamin deficiency (e.g. R. 1192). But his testimony as a whole shows that such symptoms and ailments much more frequently had other causes, that vitamin deficiency diseases were not common, and that as a general matter treatment by Nutrilite would be ineffective. (R. 1202-3, R. 1207-8, 1214-1215). He summarized his "general position" as follows (R. 1202): "For instance, if you had a feeling of low vitality due to B-1 deficiency and you gave B-1, it might improve that. If it was specifically due to B-1. However, my general position in this is this, that the Nutrilite purports to treat a general subjective feeling of a large majority of the people that they have from time to time, and suggests to them if they take Nutrilite they will be better, which is not true."

Q. Do I understand your testimony now to be that this product won't cure any of these common diseases?

A. That is right.

[After being questioned as to numerous diseases]:

(R. 112):

I will sum that up for you, Mr. Goodrich, by saying that every one of the conditions that you have mentioned, I would say that vitamin pills alone will not help or cure.

(R. 127):

JUDGE CLARK: The doctor has testified, as to most of these things, that vitamin deficiency had nothing to do with them as to this time it has developed, and that taking vitamin pills wouldn't do any good to them. Isn't that your testimony as to most of these specific diseases?

The WITNESS: Yes, sir.

(R. 221):

MR. KLEINFELD (to witness Casselberry): Do you find anything in the medical excerpts before you that convinces you that Nutrilite would prevent or cure most common diseases?

MR. RHYNE: I object to that because he has never testified on direct or any other time that it would. * * *

JUDGE CLARK: I understand, Mr. Kleinfeld, but this book which is the subject of controversy doesn't make any contention that it will prevent or cure.

* * * * * * * *

Excerpt from letter from appellee's attorney, Lee J. Myers (R. 1031-1032):

"Nutrilite Products are foods for use as a supplement to the regular diet; they do not cure, and are not offered as a cure for anything; their chief purpose is that of a food—to nourish the body and to provide it with materials for its proper growth and function."

Excerpt from letter from appellee's attorney, Charles Rhyne (R. 1168):

You will search in vain in my client's booklet "How to Get Well and Stay Well" for any such claim that Nutrilite is effective in preventing or treating most common diseases.

Appellee's brief, p. 28:

Appellee has always contended that purchasers and consumers would not place the interpretation upon its pamphlets that Nutrilite is offered as a "cure" of diseases contended for by Appellants (Appellant's Brief 19, 20, 94). The pamphlets do no more than discuss diet and nutritional deficiencies due to the lack of vitamins and minerals in ordinary diets (Fdg. 12(e) (R. 759).

(p. 167):

* * * Dr. Myers said, in line with all the other credible testimony in the case, that Nutrilite is not represented in the pamphlets as a "cure" for any disease (R. 87).

It is clear that appellee was forced to disavow any curative effect for Nutrilite—despite the in-

consistent claims in the first two booklets, in particular (R. 1155-1156, 826-836)—because of its inability to substantiate such claims. In view of the Government's contentions, as to the meaning of the booklets, it is obvious that appellee would have defended on the ground disclaimed if it had dared to do so.

These disclaimers of curative effect for Nutrilite should be contrasted with Dr. John Myers' testimony that a person "would not be likely to buy an expensive preparation like Nutrilite or some other expensive preparation until his condition got very much worse" (R. 147)—which, of course, meant that he would only take it as a cure for something serious.

6. *Dr. Butz not merely a psychiatrist.* Appellee repeatedly refers to Dr. Butz as "a psychiatrist" (Br. pp. 20, 57, *inter alia*), in order to give the impression that he was unqualified in any other field. Although Dr. Butz had previously "specialized in psychiatry" (R. 328), he testified that he had an "MD degree" (R. 1475), that while in the Army "I was general medical officer part of the time, and I was assigned to neuropsychiatry a great deal of the time, which includes general medicine" (R. 1176); and that he had examined "several thousand" patients to determine whether, *inter alia*, they had vitamin and mineral deficiencies (R. 1178-1179, 1181).

7. *Extent to which officials read the booklets.* Appellee attempts (Brief, pp. 46-50, 21) to minimize the extent to which the four administrative officials read the booklets.

Commissioner Dunbar testified:

(R. 315):

> Q. Did you read all of the 42-page booklet?
>
> A. At that time I did not. I read many parts of the booklet and discussed the entire booklet with Mr. Murray, my assistant who had made a thorough review of the whole document, and who gave me a number of pertinent facts about the method of distribution, the sales technique, and also briefly on the previous seizure actions and what had occurred in the way of revision of booklets following those further seizure actions.

(R. 316):

> I then took the booklet, and without reading the entire 42 pages in detail, considered it—considered various pages to which Mr. Murray called my attention, as well as some that I was interested in myself in reading.

Associate Commissioner Crawford testified:

(R. 334):

> I scanned through the first part of the booklet up to something like page 36, I think it was, which was the prelude, we might say, to the final pages in the booklet beginning with

"What is the solution". I read from there on out, not in a scanning way at all, but thoroughly.

(R. 384):

Q. Your testimony is you merely scanned the first 36 pages?

A. Yes, but enough to get the meaning of it and the gist of it.

Associate Commissioner Larrick testified:

(R. 395):

Q. In reaching your determination of probable cause under the statute, did you read the entire 36-page booklet?

A. I did, in its entirety.

Acting Administrator Kingsley, who appellee repeatedly asserts (Br. 49, 50, 79) read "only one" version of the booklet, testified:

(R. 504):

I have read a pamphlet, "How to get well and stay well," which I have here, which is marked Exhibit A. * * * I may have read some other version of that at some other time, because it has gone through revision.

(R. 505):

I am uncertain as to what version I read, as a matter of fact, at the time at which Dr. Dunbar came to see me in January, whether it was his version or some other version——

(R. 513):

> Q. Mr. Kingsley, I note that you signed three decisions. Why was that? A. I believe the primary basis for that was change in the character of the labeling, that originally we had a 57-page pamphlet, that after the first seizures were made, and while the action was still in the court, a 36-page pamphlet was issued, of some other number, I have forgotten the number of pages, and more recently this 42-page one has been issued, which changed the facts to some extent, although not in my judgment in any material way.
>
> Q. Did you have all three of those before you at the time you signed this decision? A. I assume I did. I cannot say for a fact one way or the other. But I had some such pamphlet and I assumed that they were the right ones.

It should be noted that the first 36 pages of the three editions of the booklets involved were substantially the same.

8. *A comparison.*

Appellee's brief, (p. 43):	Appellee's 58- and 36-page booklets, p. 35 (R. 820, 881):
"For hour after hour, the Appellants took equally extreme positions in their cross-examination on other incurable diseases having scary unpronounceable	"Most of our common diseases, with the exception of germ diseases, but including some of the most painful, the most common causes of death from illness, those with

names which only the doctors ever heard of. (R. 92-183.) These names are not mentioned in the pamphlets, were undreamed of by its authors and no ordinary purchaser or consumer could possibly think the pamphlets promised that Nutrilite would 'cure' the diseases mentioned."

the weirdest names, many rare diseases, and many which are considered incurable, are the result of dietary deficiencies."

9. *The "surveys."* Appellee refers to the "surveys of purchasers and consumers" conducted by the Food and Drug Administration (Br. pp. 19, 4; but cf. pp. 55-56). These "surveys" consisted of a report by one Food and Drug investigator of his interviews with seven persons (R. 929-940). This report is described at page 24, note 10, of our main brief.

10. *Misstatement as to delaying tactics.* Appellee accuses the Government of "delaying, obstructive, punitive and other tactics outlined here which have delayed a decision for a year on the first motion to consolidate" (Brief, p. 96) and of "having tried every possible delaying technicality" (Brief, p. 83). There is no basis whatsoever for these statements. The condemnation suits were instituted between October 6, 1948, and January 4, 1949. The original complaint in the instant suit was filed

December 30, 1948 (R. 689). The delay in trying any of the condemnation or other suits against appellee has resulted from the pendency of the present litigation. Appellee has not moved for expedition, and the Government has not opposed expedition.[5]

Appellee's charge is apparently based upon the Government's refusal to *stipulate* to remove the cases to Los Angeles for a consolidated trial. It has been the Government's position that, as a matter of law, appellee was not entitled to have the cases tried in its home district (see Government's main Brief, p. 66, note 40),[6] and that, as a matter of general enforcement policy, it was not willing to consent to trial before a jury in that district. The Government has always conceded that under the statute appellee could as a matter of law consolidate in any of the districts in which condemnation proceedings had been instituted; the Government

[5] In the criminal proceeding pending with respect to appellee's first booklet, the Government did, on or about October 18, 1948, request postponing the determination of appellee's motion to dismiss until after the decision of this Court in the *Kordel* and *Urbuteit* cases (335 U.S. 345, 355), which had been argued on October 14, 1948, and which were decided on November 22, 1948 (R. 535-536, 264-265).

[6] The appellee suggests that Section 1404(a) of the new Title 28 allows a case to be transferred to its home district. (Br. 95). But that statutory provision only authorizes transfer of an action "to any other district or division where it might have been brought". As *United States* v. *23 Gross Jars * * * Enca Cream*, 86 F. Supp. 824 (N.D. Ohio) holds, articles found in one district cannot be seized in another district, and accordingly Section 1404(a) is inapplicable. Section 1404(b), which makes provision for transfer of proceedings in rem, "permits transfer of cases between divisions" of the same judicial district. See Reviser's Notes and case just cited.

has also been willing to stipulate for trial in a district adjacent to appellee's home district (R. 764, 1051). The Government's refusal to waive its statutory right not to consent to trial in the home district can hardly be regarded as an obstructive and delaying tactic.

11. *Misstatement as to "smearing publicity".* Appellee's brief refers to "the smearing publicity Appellants have released [as] grist for this defamation mill" (p. 85), "the publicity released by Appellants which accompanied these seizures" (p. 83), "the weapon of publicity" (p. 92), the "stigmatizing publicity actions of Appellants" (p. 159).

The only statement in the record relating to publicity is the following testimony of Casselberry (R. 66):

> Q. What about the publicity released by the Food and Drug Administration, what effect did it have?
>
> A. To answer that question, I must say that we can't be sure that the publicity was actually released by the Food and Drug, but publicity did follow in many cases where seizures were made, with the result that everybody in the community who was using Nutrilite learned that the product was being seized. They naturally assumed that the Government was right and we were wrong, so that led also to loss of many customers.

The fact that the institution of the condemnation suits received publicity hardly supports appellee's

statements. There was no evidence of any publicity released by the Food and Drug Administration at all.

12. *Misstatement as to testimony about "trace" elements.*

Appellee's Brief (pp. 134-135)

"The expert testimony *for both parties* below recognized that this base contains what has been termed 'trace' elements and that *the same are essential in human nutrition* (R. 163-4, 480, 1199, 1524). [Emphasis supplied.]

Record

DR. JOHN MYERS, Appellee's witness (R. 163-164):

"These people have attempted to put into it not only the crystalline vitamins that the experimentalists have found to be helpful in specific cases, but have added a concentrate of parsley, alfalfa, and watercress, very carefully concentrated to produce those things that we do not know about. They are so small that we cannot trace them. We know that they are specific and essential, but we do not know how or why they fit into the picture."

The testimony of appellants' witnesses at the pages cited was as follows: The closest per-

tinent passage on R. 1199 would seem to be the following:

DR. BUTZ:

"Q. Do you know that there are new vitamins being discovered all the time and that some of those could be contained in the base without your knowing it or my knowing it?

"A. That is true. That part of it is true."

DR. WALTER MYERS (R. 480):

"* * *

"Q. Have you ever heard of the trace vitamins and minerals?

"A. Yes, sir.

"Q. Do you know that they are contained in alfalfa, watercress and parsley?

"A. Yes, sir.

"Q. Do you think that they have no value in human nutrition?

"A. They have value, but we get them from other sources, when we

eat a reasonable diet of vegetables.

"Q. But your testimony is that you gave that base no value in your answers; is that right?

"A. I said it would not cure these various disorders."

DR. NELSON (R. 1524):

"Q. Is it possible that this base of alfalfa, parsley and watercress, which Nutrilite has and which is not contained in the other two products which you list in your affidavit, could mean that Nutrilite is more valuable in human nutrition than those other two products?

* * *

"THE WITNESS: I don't know. It may be a possibility."

Clearly, appellants' medical witnesses did not state that the so-called trace elements, which might be found in the base, were essential in human nutrition. And appellee's witness, who thought they

were, indicated that no one knew much about the elements in question.

Respectfully submitted,

PHILIP B. PERLMAN,
Solicitor General.
JAMES M. MCINERNEY,
Assistant Attorney General.
ROBERT L. STERN,
Special Assistant to the Attorney General.
VINCENT A. KLEINFELD,
Attorney, Department of Justice.

STATEMENT	1
QUESTIONS PRESENTED	3
SUMMARY OF ARGUMENT	4
ARGUMENT:	
1. The Nature of the Appellee's Product and Business	9
2. No Attack Here on High Purposes of Food, Drug and Cosmetic Statute—Act Has Four Other and Separate Multiple Seizure Provisions Not Affected by Seizure Provision Involved in This Case—Constitutional Issue Narrowly Confined to Unique Facts	11
3. The 22 Major Arbitrary, Capricious and Oppressive Acts of Appellants	13
4. The Trial—Nearly Every Question of Fact Foreclosed Against Appellants by Discovery and Admissions—Appellants Unusual Offer of Damaging Facts Against Themselves	19
5. Appellants' Own Investigations Reveal That Under Customary Conditions of Purchase and Use Purchasers and Users Are Not Misled by Appellee's Pamphlet	27
(a) The Statutory Test	27
(b) "None of Them Thought That Nutrilite Was a Cure for Anything But Merely Vitamins and Minerals Which Would Build Their Bodies Up"	28
6. The Appellants' Brief Chiefly Devoted to An Ancillary Issue Rather Than Main Issues in Case	30

Page

7. Appellants' "Statement" in Their Brief Is Misleading As to the Facts and Issues 33
8. Appellants in 10 Years Surveillance Unable to Develop One Fact Justifying Seizures 39
9. Who Is Acting Honestly, Fairly, and in Good Faith in This Case? 40
10. The Six Ex Parte Decisions of Appellants Were Arbitrary, Capricious and Oppressive 46
    (a) Crawford and Dunbar Merely "Scanned" or Read Parts of the Pamphlets in Question, No Honest Attempt Being Made to Read or Interpret the Pamphlets in Their Entirety 47
    (b) Three Determinations on Three Separate Pamphlets Based Upon a Reading of Only One Unidentified Pamphlet 49
    (c) All Six Determinations Made With No Facts Before Decision Maker Showing Injury or Damage to Any Purchaser or Consumer 51
    (d) The Determinations Ignored and Were Diametrically Opposed to the Findings of Fact of Appellants' Only Known Official Investigation 54
    (e) Appellants Acted Arbitrarily and Capriciously in Placing Any Reliance Upon the So-Called Findings Attributed to a Psychiatrist Unqualified to Make Such Findings 57
    (f) The Determinations Were Made Secretly Without Giving Appellee the Opportunity It Requested to Eliminate Objections 60
    (g) The Conclusion of the Court Was the Only One It Could Reach Under the Facts of This Case and the Decisions of This Court 62
11. Appellants Violated the Statutory Provisions

Page

Here Involved in Making Their Decisions Authorizing Multiple Seizures 66
(a) Appellants Have Statutory Power to Make Only One Seizure "Except" in 4 Specified Cases of Misbranding—They Can Make Unlimited Multiple Seizures of Products Charged to Be Adulterated 66
(b) What Appellants Have Done Does Not Comply with the Statute 67
(c) J. D. Kingsley's Determinations of Probable Cause Are Void on Their Face 72
(d) The Determinations Are Not Conclusive Evidence of Probable Cause 74
(e) Kingsley Did Not Have Probable Cause Under the "Reasonable Man" Test 76
(f) Appellants Authorized Use of Multiple Seizures and Embargoes As a Punishment Rather Than a Public Protection in Violation of Statute and Due Process Clause .. 81
(g) Conclusions on Statutory Violation 93
12. Libel and Law Courts Offer No Remedy Against Appellants' Arbitrary, Capricious and Oppressive Actions 93
(a) Libel Courts Provide No Stay of Further Seizures Pendente Lite 94
(b) Libel Courts Cannot Consider Arbitrary, Capricious and Oppressive Conduct 97
(c) Libel Courts Cannot Give Relief for Damages Suffered 99
(d) Multiplicity of Actions Not Avoided by Libel Courts 102
13. The Decisions Authorizing Multiple Seizures Are Reviewable Under the Administrative Procedure Act 105
(a) Right of Review 106

Page

(b) The Decisions in Question Were Final As to Use of Multiple Seizures 106
(c) The Scope of Review 109
(d) The Instant Case Does Not Fall Within the the Exceptions to Review Under the Act .. 109
14. The Court As a Court of Equity Had Jurisdiction to Determine Whether the Decisions of Appellants were Made Arbitrarily, Capriciously, Unreasonably and Unlawfully 114
15. Three-Judge Court Must Try and Decide All Issues of the Case 118
(a) The Statute Gives the 3 Judges Jurisdiction to Decide All Issues in the Case—Text and Legislative History 118
(b) The Decisions of This Court Hold the 3-Judge Court Has Jurisdiction to Decide All Issues 120
16. Whether Appellee's Pamphlet Violated the Statute Was An Issue Properly Decided By the Trial Court 124
17. The Three-Judge District Court Properly Found That Appellee's Labeling Is Not Misleading 132
18. The Legislative History of the Act Does Not Sustain Appellants' Contentions—It Indicates a Contrary View 139
(a) Judicial Review of Arbitrary, Capricious and Oppressive Conduct Not Intended to be Eliminated 139
(b) Words "Without Hearing" Slipped Into Bill in Last Conference Just Before Final Adoption and Probably Unknown to Most Members of Congress 143
19. "Nor Will We Go Upon Him, Nor Will We Send Upon Him, Unless . . . . By the Law of the Land" 147

Page

20. In Absence of Emergency of Compelling Public Necessity Requiring Immediate Action, No Person May Be Irremediably Deprived of His Property by Governmental Action Without a Hearing—If What Appellants Did Is Authorized by Statutory Words They Violate Due Process ... 151
21. Errors Claimed by Appellants on Conduct of Trial, Admission of Evidence and Requiring Production of Documents, if any, Do Not Warrant Reversal 165
22. Conclusion 172

IN THE

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1949

No. 568

OSCAR R. EWING, Federal Security Administrator, et al.,
Appellants,

vs.

MYTINGER & CASSELBERRY, INC.
Appellee

BRIEF FOR THE APPELLEE

STATEMENT

The leave to amend Appellee's complaint contained in Judge Pine's order of March 4, 1949 (R. 724) was not limited to "attack the constitutionality of Section 304(a) of the (Food, Drug and Cosmetic) Act"[1] an impression Appellants seek to convey on page 12 of their brief, but was leave to amend generally. Unfortunately the argument at the time the form of order was settled before Judge Pine on March 4 is not in the Record but the order certainly speaks for itself (R. 724). Appellee's amended complaint sets forth many additional acts of misapplication of the multiple seizure provisions to it by additional facts showing

[1] 52 Stat. 1040, 1044 (1938); 21 U. S. C. 301, 334(a).

arbitrary, capricious and oppressive acts as well as the claim that the multiple seizure provisions of the Act are unconstitutional as applied to Appellee.

Appellee disagrees with Appellants' statement in their brief of the facts of this Case. Appellants in their statement of facts to a great extent either state and rely upon testimony of their witnesses rejected by the Trial Court on the basis of its observation of the demeanor and veracity of witnesses on the stand or state facts not supported by the Record. The major misstatements are pointed out in the argument on the facts herein, although such misstatements are so numerous and so obvious at various points it would unduly prolong this brief to discuss them all. The Findings of Fact of the Trial Court are an accurate and concise statement of the facts herein and Appellee adopts them as its statement thereof (R. 756-770).

Appellee is not herein stating what it hopes to prove, as in the argument on the Petition for a Writ of Prohibition and/or Mandamus. Appellee has now proved all these facts and is here with findings showing all 3 trial Judges in unanimous agreement that such proof was made at the Trial.

QUESTIONS PRESENTED

Aside from jurisdictional and procedural questions raised by Appellants, the two major questions presented are:

(1) Were Appellants' actions herein authorized by the words contained in Section 304(a) of the Food, Drug and Cosmetic Act which read as follows:

> "That no libel for condemnation shall be instituted under this Act, for any alleged misbranding if there is pending in any court a libel for condemnation proceeding under this Act based upon the same alleged misbranding, and not more than one such proceeding shall be instituted if no such proceeding is so pending, except that such limitations shall not apply (1) when such misbranding has been the basis of a prior judgment in favor of the United States, in a criminal, injunction, or libel for condemnation proceeding under this Act, or (2) when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency that the misbranded article is dangerous to health, or that the labeling of the misbranded article is fraudulent, or would be in a material respect misleading to the injury or damage of the purchaser or consumer."

(2) If such actions were authorized by those words of that Section, does the section, as thus construed, violate the due process clause of the Fifth Amendment of the Constitution of the United States?

SUMMARY OF ARGUMENT

I

Appellants acted arbitrarily, capriciously and oppressively in making their determinations authorizing multiple seizures without reading pamphlets they found to be misleading in a material respect to the injury or damage of the purchaser or consumer; without considering facts in official surveys in their files compiled pursuant to the statute and favorable to Appellee showing that purchasers and consumers under customary conditions of purchase and use did not conclude that Appellee's pamphlets are misleading (*Kwock Jan Fat* v. *White*, 253 U. S. 454, 464, *Lloyd Sabaudo Societa Anonima* v. *Elting*, 287 U. S. 329, 338-339); with *no* facts or complaints before them showing injury or damage to any purchaser or consumer from Appellee's labeling or its product (the statute requires that such determinations be based on "facts found," Cf. *Interstate Commerce Commission* v. *Louisville & N. R. Co.*, 227 U. S. 88, 91); by deliberately planning their 11 seizures on a far-flung nationwide geographic pattern with a time schedule designed to inflict the greatest possible punishment (Cf. Mr. Justice Brandeis' dissent in *Milwaukee Publishing Co.* v. *Burleson*, 255 U. S. 407, 433) by injury to Appellee's business reputation; by planning seizures to keep "pressure" on Appellee (as outlined in Appellants' "Pressure" memorandum) until the injunction herein (evidently anticipated by them) was granted; by acting secretly *ex parte* to uphold prior unlawful decisions of subordinates through consideration of their biased views only; by rejecting Appellee's two requests for an opportunity to present the true facts when no emergency or situation of compelling public interest required summary action; and by doing all the other unfair and unreasonable acts set forth in the Findings of Fact herein.

II

There are four separate and distinct provisions of the Act which are not questioned here under which multiple seizures of products may be made when there is a charge of (1) adulteration, (2) danger to health, (3) fraudulent labeling, or (4) where a prior judgment condemning the particular labeling has been obtained. The provision authorizing multiple seizures in exceptional circumstances when labeling is misleading was not intended to apply to factual situations like that involved in the instant case. The Congress never intended to authorize what Appellants have done here. *Waite* v. *Macy*, 246 U. S. 606, 608-609; *Gegiow* v. *Uhl*, 239 U. S. 3, 10. Appellants did not comply with the statute by acting in the manner referred to in Part One of this Summary of Argument, the decision makers did not act as reasonable men and therefore did not have probable cause to believe Appellee's labeling misleading, and their decisions are void on their face. Appellants made their authorizing decisions and secured the embargoes for punishment purposes rather than protection of the public. Appellants' actions therefore violate the statute's mandate.

III

A trial of the issues involved in any one of the libel seizure actions in a libel court offers no remedy against Appellants' arbitrary, capricious and oppressive actions herein because: (1) libel courts have no jurisdiction over Appellants in their individual capacities; (2) a libel court cannot stay further seizures *pendente lite* and Appellants could ruin Appellee almost overnight by carrying out their "Pressure" memorandum scheme of making seizures by use of mimeographed forms and telegraphed instructions against which plan consolidation for one trial is no remedy as it is the *seizures* and not the trial which causes the irreparable injury; also, further seizures would be made by Appellants while the cases are being consolidated and tried

and the libel court cannot stop seizures during all of that time. Appellants have used delaying tactics to prevent consolidation and trial of any of the libel actions herein so they could carry out their "pressure" punishment plans until an injunction is granted in the instant case or the indictment trial is held in California; (3) the libel courts *can never* consider whether the determinations authorizing multiple seizures were made arbitrarily, capriciously and oppressively, as the only issue before those courts is whether labeling is "misleading in any particular." This means that never in a libel court would there be any consideration of Appellants' actions herein or relief against such action regardless of how illegal or unfair they are; (4) libel courts cannot stop damage *pendente lite* or give relief for damages suffered; and (5) there is no way the libel courts can avoid a multiplicity of actions. (6) The hearing in the libel court does not offer a remedy which protects Appellee's constitutional rights under the facts herein.

IV

The Administrative Procedure Act provides a review of the six determinations authorizing multiple seizures because such determinations are final decisions in every respect on the authorization of the use of multiple seizures, and such authorization is not an issue which can be tried in the libel courts. Without such authorizing decisions more than one seizure cannot be made. Also, contrary to Appellants' contention, the Court as a court of equity had jurisdiction to determine whether public officials, like Appellants, have acted unlawfully. *Garfield* v. *Goldsby*, 211 U. S. 249, 262. Further, and also contrary to Appellants' contentions, the legislative history specifically indicates that equity courts were intended to have their traditional jurisdiction to stop illegal action under Section 304(a). This is made clear in a Congressional report *not* quoted by Appellants in their brief. The three-judge court statute gave

the Trial Court jurisdiction to decide all issues involved in the case "in order that a single lawsuit may afford final and authoritative decision of the controversy between the parties." *Public Service Commission* v. *Brashear, Freight Lines,* 312 U. S. 621, 625; *Siler* v. *Louisville & Nashville R. Co.,* 213 U. S. 175. The text of the statute, its legislative history, and decisions of this Court so hold. Therefore, the Trial Court had jurisdiction to determine the ancillary issue of whether Appellee's pamphlets violated the Act. Such an issue is not confined by the statutory scheme to libel courts as the statute contains no such confining language. Federal courts considering injunction and criminal actions are intended to have jurisdiction to pass on the same issue and courts considering issues in other types of litigation are not prohibited (as they were, for example, in the price and rent control statute) from deciding such an issue if it is involved in the litigation as in the instant case. Appellants' entire defense was in fact based on that issue. Both parties presented their full cases on the issue and Appellants lost as all they presented was the biased opinions of the decision makers while Appellee offered evidence of the impressions of purchasers and consumers *compiled by Appellants* which refuted Appellants' opinions. "A court of equity ought to do justice completely and not by halves . . . a court of equity, if obliged to take cognizance of a cause for any purpose, will ordinarily retain it for all purposes, even though this requires it to determine purely legal rights that would not otherwise be within the range of its authority." *Camp* v. *Boyd,* 229 U. S. 530, 551-552; ". . . it should dispose of the entire case and its incidents, and not remit any part of it to a court of law." *Greene* v. *Louisville & I. R. Co.,* 244 U. S. 499, 520; ". . . where, as here, the equitable jurisdiction of the Court has been properly invoked for injunctive purposes, the Court has power to decide all relevant matters in dispute and to award complete relief even though the decree includes that which

might be conferred by a court of law." *Porter* v. *Warner Holding Co.*, 328 U. S. 395, 399.

V

If the words "without hearing" or any other language contained in Section 304(a) under which Appellants claim their action herein is authorized, is construed as giving authority to do the arbitrary, capricious and oppressive actions complained of, that Section as thus applied to Appellee violates the due process clause of the Fifth Amendment of the Constitution of the United States. In the absence of an emergency or a situation of compelling public necessity requiring immediate action, Appellee may not be deprived of its property and irreparably injured in its business reputation and good will without a hearing containing an opportunity to present its facts showing the deprivation and other injury is unlawful. Appellants' actions in this case demonstrate a lack of that fundamental fairness required by the due process clause, so if the language questioned really authorizes what Appellants have done it violates that clause.

ARGUMENT

1. The Nature of the Appellee's Product and Business

Appellee is the exclusive national distributor of a vitamin product known as "Nutrilite Food Supplement," consisting of 16 vitamins and minerals formulated in a base prepared from extracts of alfalfa, parsley and watercress (R. 757, Plaintiff's Ex. 8, R. 54-55, on file with clerk). This food supplement is sold to consumers on the basis that ordinary diets are deficient in vitamins and minerals and Nutrilite will help make up such deficiencies (R. 758-759). It is the unique base of alfalfa, parsley and watercress which sets Nutrilite apart from all other vitamin and mineral products (R. 131, 163-164, 1182). This base is formulated by a process whereby one ton of alfalfa, parsley and watercress is reduced to approximately 4 to 10 pounds of this base (R. 55). The base contains vitamins and minerals known as "trace" elements which have not yet been fully identified by the scientific research in the field but these elements are known to be essential and beneficial to human nutrition (R. 131-132, 163-164, 480).

Nutrilite contains no substances or materials or combination of substances and materials harmful or detrimental in any manner to human users (Complaint and Answer Par. 4, 726, 749). Nutrilite does contain substances and materials which have been demonstrated by scientific tests and by actual experience of users to be beneficial to the health of human beings and Appellants admit that Nutrilite is harmless (R. 749) and that its vitamin and mineral contents are valuable in preventing those vitamin and mineral deficiencies in the diet of human beings (R. 275). No claim has ever been made by any Federal, state or other governmental agency that Nutrilite is adulterated or harmful in any manner to the health of the users thereof (R. 55, 757).

The need for the addition of vitamins and minerals to the diet flows from absence of these food factors in the

diet due to depleted soils and the canning and refining processes whereby the vitamins and minerals are taken out of ordinary foods (R. 74). This Court has had occasion to consider the development of enriched foods and the reasons therefor in other cases.[2] So well established are these facts that Counsel for Appellants advised the trial court that the efficacy of vitamins and minerals is not involved in this case (R. 49, 51, 54-55, 80-81, 286), for Appellant's admissions had foreclosed any contrary position (R. 274-283). Appellant's brief states: "There was agreement that Nutrilite and vitamin products generally would be useful in helping persons suffering from dietary deficiency resulting from insufficient vitamins." (p. 79).

The product now sold as Nutrilite was first manufactured in California in 1933 (R. 56) and the great bulk of the product is now and always has been sold in California. There

---

[2] See the Findings of Fact of the Federal Security Administrator appearing in the Transcript of Record in *Federal Security Administrator* v. *Quaker Oats Co.*, 318 U. S. 218, 224-225. The following findings appear on page 617 of the Transcript of Record:

> "33. Recent investigations of the diets of persons in various sections and in various income groups have shown that in many cases the food consumed does not furnish sufficient amounts of certain necessary nurtitional elements to maintain health. The deficiencies are more prevalent in the case of persons with low incomes. Such persons usually supply a larger part of their energy requirements from flour and self-rising flour than the average person because of the cheapness as a source of energy.
>
> "34. Among the most serious and widespread deficiencies, in children as well as in adults, are those of vitamin B_1, riboflavin, nicotinic acid, and iron. Deficiencies of these vitamins tend to occur in the same individuals.
>
> "35. A deficiency of calcium exists in certain groups of the population. A deficiency of vitamin D exists in large numbers of infants and children."

Nutrilite contains all these elements and all others found to be beneficial in human nutrition in the amounts recommended by the National Research Council—the admitted authority in this field—and experts on the subject (R. 131-132, 163-164, 757).

are now more than 5,000 persons engaged in the distribution of the product throughout the Nation (R. 56, 1030, 66) and sales exceeded $500,000 per month prior to Appellants' multiple seizures of the product (Pl. Ex. 14, R. 1029, 66).

2. No Attack Here on High Purposes of Food, Drug and Cosmetic Statute—Act Has Four Other and Separate Multiple Seizure Provisions Not Affected by Seizure Provision Involved in This Case—Constitutional Issue Narrowly Confined to Unique Facts

At the very outset, Appellee wants to make it clear that its attack is not upon, and it does not here seek to frustrate or obstruct, the high purposes of the Food, Drug and Cosmetic Act of 1938. The attack herein on illegal action of Appellants if sustained on the unique and unusual facts of this case, which are contained in the Findings of Fact of the Trial Court will not lessen the public protection intended by the Act. Such shocking facts as condemnation without reading,[3] action admittedly with no facts when action must be based on "facts found" and the other unusual facts herein will probably never reappear in any future case.

Appellee's constitutional attack is a narrow one directed to about 50 words of the Act composing a minor part of one section thereof as applied to Appellee under the unique facts herein. If the decision upholding the attack on the arbitrary, capricious, oppressive and unlawful acts of Appellants is sustained, the Constitutional question is thereby avoided.[4]

---

[3] Items 4, 5 and 6 *infra* page 15.

[4] *Blodgett* v. *Holden*, 275 U. S. 142, 148; *Crowell* v. *Benson*, 285 U. S. 22, 62; *Brandeis J.* dissenting in *Ashwander* v. *Tennessee Valley Authority*, 297 U. S. 288, 348; *Ex parte Endo*, 323 U. S. 283, 299-300; *Alma Motor Co.* v. *Timken-Detroit Axle Co.*, 329 U. S. 129, 136-137; *Rescue Army* v. *Municipal Court*, 331 U. S. 549, 568 *et seq.*

The constitutional issue is confined specifically to the facts [5] of this case (the major 22 actions complained of are set forth in the next section herein) and if decided in Appellee's favor it will also not lessen the protection of the public intended by the Act. The statutory language herein questioned and the Constitution do not confer upon Apellants the right to make unlimited seizures of Appellee's product. All powers of Appellants, if any, flow from the "exception" in Section 304(a) of the Food, Drug and Cosmetic Act allowing multiple seizures under *exceptional* circumstances.

Four provisions of Section 304(a) of the Act *which are not involved in this case* allow multiple seizures to protect the public in cases where products are (1) adulterated, (2) sold under labeling previously condemned by a Federal Court, (3) dangerous to health, or (4) sold under fraudulent labeling. The issues herein are thus narrowed to the following provisions of the Act as applied [6] to Appellee under the unique facts of this case: [7]

> "(2) When the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency that . . . the labeling of the misbranded article is . . . or would be in a material respect misleading to the injury or damage of the purchaser or consumer."

---

[5] This Court has repeatedly referred to the helpfulness of a full development of the facts in determining constitutional issues. *Gospel Army* v. *City of Los Angeles*, 331 U. S. 543, 548; *Borden's Farm Products Co.* v. *Baldwin*, 293 U. S. 194, 209; *Chastleton Corp.* v. *Sinclair*, 264 U. S. 543, 547-548. Read, *The Consideration of Facts in Due Process Cases*, (1930) 30 Col. L. Rev. 360.

[6] Cf. *Louisville Joint Stock Land Bank* v. *Radford*, 295 U. S. 555, 601-602.

[7] Although Appellee does not ask that this provision be held invalid on its face, the separability section of this Act (Sec. 901) leaves the balance of the Act unaffected in such cases. *Electric Bond & Share Co.* v. *Securities and Exchange Commission*, 303 U. S. 419, 434.

Appellants justify their actions upon the "misleading" labeling charge only and Appellee's product is (1) *not* adulterated, (2) there is *no* prior judgment, (3) the article is *not* dangerous to health and (4) its labeling is *not* fraudulent.

If the statutory language here questioned authorized Appellants to do the arbitrary, capricious and oppressive acts revealed by the findings of fact herein, then it is Appellee's position that these few statutory words violate every idea of fundamental fairness for which the due process clause stands. Appellants, in effect, contend this statute allows them to exercise uncontrolled and uncontrollable arbitrary, capricious and oppressive power because it happens to have the unusual words "without hearing" as part of its text. If the statute really does that, because of those or any other words it contains, it is Appellee's position that the due process clause offers Appellee a constitutional protection paramount to any such power Appellants can acquire by the statutory provisions here involved.

3. The 22 Major Arbitrary, Capricious and Oppressive Acts of Appellants

Since the Appellee's whole case turns on whether Appellants violated the statutory words here involved by a series of arbitrary, capricious, oppressive and unlawful acts, or whether those statutory words are unconstitutional because they authorize such acts, it is deemed advisable at the outset to state 22 of the major acts of Appellants complained of while at the same time referring to the Findings of Fact and the 25 items set forth, *infra*, pp. 24-26 which give other acts almost equally unjust and unfair. The 22 are:

1. Deliberately planned and executed the seizures of Appellee's product in the following nationwide geographic pattern and time schedule (R. 729-751):

Belleville, New Jersey	October 6, 1948
New York, New York	October 19, 1948

Buffalo, New York	October 28, 1948
Hastings, Nebraska	December 1, 1948
Belleville, New Jersey	December 15, 1948
Spokane, Washington	December 23, 1948
Seattle, Washington	December 30, 1948
Clarkfield, Minnesota	December 31, 1948
St. Petersburg, Florida	January 4, 1949
Chicago, Illinois	January 3 and 4, 1949

with each seizure designed to inflict the greatest possible publicity punishment upon Appellee, knowing full well that because of the issues in each being the same the Appellee has a right to consolidate the seizures for trial into one case so punishment would be the only result of each seizure beyond the first.[8]

2. Each of the six decisions authorizing multiple seizures on the ground that the labeling *"is" or* "would be" misleading *in a material respect* to the "injury" *or* "damage" of purchasers and consumers,[9] was made with *no* facts showing "injury" or "damage" to *any* purchaser, user, or consumer from Nutrilite or its labeling.[10]

3. The decision makers had no facts before them showing *one* complaint from any purchaser or consumer,[11] although prior to the decisions Appellants conducted one of the most searching investigations

---

[8] Finding 22, R. 763-764; Finding 39, R. 769. (Never *once* in their brief do Appellants mention the geographic location of the eleven seizures.)

[9] Each of the 6 decisions conclude: ". . . there is probable cause for me to believe and I do believe, that the labeling of this article *would be and is* in a material respect misleading to the injury *or* damage of the purchaser or consumer." (Italics supplied.) R. 1172, 1174, 1218, 1534, 1535, 1541. Not once do Appellants in their brief mention the very highly important verb "is"—they avoid it for the obvious reason that they know this lack of facts indicates extreme capricious action. The alternative finding of "injury" or "damage" has not been explained by Appellants.

[10] Finding 17, R. 761, Crawford; Finding 29, R. 765, Larrick; Finding 30, R. 765, Dunbar; Finding 35, R. 767-768, Kingsley; R. 532, (Item 6).

[11] *Ibid.*

ever made in this Nation, of Appellee, its distributors and its customers—interrogating the latter admittedly "unreasonably." [12]

4. Concluded multiple seizures should be made of Nutrilite upon the 58 page pamphlet after reading *only* the last 20 pages of the pamphlet.[13]

5. Concluded the 42 page pamphlet was misleading after reading only the parts pointed out by the author of the famous (in this case) "pressure" memorandum.[14]

6. Read but *one* unidentified pamphlet but signed decisions concluding that *three* involved herein were all misleading.[15]

7. Made 5 of 6 decisions after completion of an official Food and Drug Administration survey of purchasers and consumers to determine their impression of Appellee's pamphlets but refused or failed to consider findings of that survey which were 100% contrary to all six decisions and to the contentions of all the libel papers.[16]

8. Made all 6 decisions and did their other acts herein knowing that Nutrilite is beneficial and harmless,[17] that its label complied with the law,[18] and that there was no question of adulteration, danger to health or fraudulent labeling and that no prior judgment against Appellee's labeling had been rendered in any court.[19]

9. Rejected Appellee's two specific requests for an opportunity to present the true facts, listened only to biased subordinates bent on defending their prior decisions, and their counsel (R. 503), and backed up these subordinates' decisions by signing decisions identical

therewith knowing the disastrous effect of such action[20] and knowing no emergency existed requiring this refusal to talk to Appellee.[21]

10. Refused to talk to Appellee about its labeling until *all* litigation completed;[22] thereby offering Appellee as the only course of action it could take, the fighting of a multiplicity of actions or closing down of a business upon which more than 5,000 persons depend for their livelihood and stopping the sale of a product which thousands obviously find beneficial or they would not buy it.

11. Made their decisions authorizing multiple seizures in furtherance of a plan to keep a sustained pressure on Appellee and to inflict punishment rather than to protect the public.[23]

12. Unleashed their terrific nationwide far-flung geographic plan of multiple seizures[24] without notice or warning when Appellee's product and labeling had been under Appellants' surveillance since 1939.[25]

13. Arrogantly brushed aside and ignored Appellee's good faith requests for an opportunity to correct any labeling which Appellants might question.[26]

14. Kept their decisions authorizing multiple seizures secret from Appellee to prevent discovery that the first three were unlawfully made.[27]

15. Claimed to have relied upon a psychiatrist for medical "facts" knowing he was unqualified in the field of vitamins and minerals, this man's lack of qualifications being openly admitted by Appellants' refusal to call him as a witness in the trial despite repeated warnings by the Trial Court that an unfavorable inference would be drawn from such refusal.[28]

16. Deliberately violated an agreement to make no further seizures in exchange for a continuance in the indictment case.[29]

17. Gave "untrue information"[30] to secure embargoes upon Appellee's product in widely scattered parts of the United States, said embargoes being deliberately planned to inflict the maximum irreparable injury and damage.[31]

18. Gave unfavorable opinions and injurious information to private persons and organizations concerning Appellants' actions against Appellee.[32]

19. Unreasonably volunteered information to magazines and newspapers in a way which would most injuriously damage Appellee.[33]

20. Made deliberate efforts to have seized only "large" shipments of Appellee's product so as to make its losses as large as possible.[34]

21. Instituted seizure actions in places far removed from Appellee's principal place of business so as to necessitate the maximum amount of expense in defending and consolidating said actions, and also to prevent a trial in Los Angeles of their charges.[35]

[34] R. 533, item (20).

[35] Finding 22, R. 763-764; Finding 37, R. 768; Finding 39, R. 769. It was only on Sept. 22, 1949, when they decided their obstructive tactics on the motion to consolidate the libel actions were doomed to fail that they filed an injunction action in Los Angeles including the same issues as those in the libel cases. See *infra* page 88. Appellant's claim on pages 75-76 of their brief that the instant case prevented a trial by jury obviously indicates they never intended to try this Los Angeles injunction as that action is under Section 302(a) of the Act which unlike the section on libel courts (304(b)) does not provide for a jury trial. On appellant's stalling and delaying tactics see *infra* page 83-88. Contrary to what Appellant's say (p. 65 brief) the removal motion also asked for trial in a district of "reasonable proximity" to Appellee's principal place of business—the statutory language (R. 1042-1058).

22. Gave instructions that the Buffalo seizure action be moved no closer to Appellee's principal place of business in California than the Midwest,[36] and throughout all the litigation carried out a deliberate plan of avoiding, in any of the litigation, a trial of the merits of the charges against Appellee's labeling.[37]

In their brief Appellants do not pretend to defend or explain these 22 actions and the innumerable other unfair and unjustifiable actions they have carried out against Appellee, all as set forth in the Findings of Fact of the Trial Court, *because they have no defense.*[38] Nearly every one of the findings on these actions is on *uncontradicted* evidence, evidence offered by Appellants, or *admissions of* Appellants. As explained *infra* pp. 30-33, Appellants devote most of their brief, as they did their evidence at the trial, to the ancillary issue of Appellee's labeling rather

[36] R. 533, item (16).

[37] Finding 24, R. 764, Finding 32(c), R. 767. The pressure memorandum shows no interest in actual trial of any libel case (consolidated or otherwise) as it mentions only the criminal case and the instant injunction action and does not mention any trial of the libel cases (R. 67, 1030A, 69).

[38] This Court in *Federal Trade Commission* v. *Cement Institute*, 333 U. S. 683, held at the Government's urging that evidence of activities both prior and subsequent to a particular transaction in question may be relevant as reasonably tending to show the purpose and character of particular transactions under scrutiny. It was stated by this Court at page 705:

> "The consideration given these activities by the Commission was well within the established judicial rule of evidence that testimony of prior or subsequent transactions which for some reason are barred from forming the basis for a suit, may nevertheless be introduced if it tends reasonably to show the purposes and character of particular transactions under scrutiny."

Appellants' actions both prior and subsequent to their decisions are thus relevant as they show the purpose and character of the decisions.

than to the issues raised by these 22 actions. They do argue on the law that the Court had no jurisdiction to protect Appellee against such acts.

4. The Trial—Nearly Every Question of Fact Foreclosed Against Appellants by Discovery and Admissions —Unusual Offer by Appellants of Damaging Facts Against Themselves

Appellants seem to think it indicates weakness in Appellee's case to say that it was composed largely of admissions and papers from Appellants' records. (P. 14, Appellant's Brief). As disclosed by the Record herein, prior to the trial herein, Appellee, made extensive use under the Federal Rules of Civil Procedure of (1) depositions, (2) interrogatories, (3) requests for admissions, and (4) other discovery processes to develop every fact known to Appellants. All of this process was bitterly fought by Appellants (R. 11-22, 286, 669-680, 746, 747) but in the end most of the information was ordered produced by the Court. And the record also shows that Appellee used only a small portion of the great volume of depositions, interrogatories, admissions and documents. Appellee needed to use only a small portion of each to prove its case and carefully selected the parts essential to its case in the interest of conserving the time of the Court by eliminating non-essential evidence. Appellee is proud of the fact that Appellee's case is made up almost entirely of admissions by and documents received from Appellants. Such action by Appellee is believed to be the very purpose contemplated by the Federal Rules of Civil Procedure. Many other admissions are made in Appellants' answer (R. 748-753) to the complaint (R. 725-737), such as in paragraph 18 (a) the 2 requests for a hearing (R. 732) and denial thereof (R. 752).

The surveys of purchasers and consumers under ordinary conditions of purchase and use (R. 929-939, 38) which came from Appellants' own files, constituted a direct con-

tradiction of the chief objection raised by Appellants to Appellee's advertising pamphlets. It was from Appellants' own lips that the admissions were wrung most reluctantly that they made their decisions authorizing multiple seizures with not one fact before them showing injury or damage to any person, no complaints from any person,[39] and that the "pressure" memorandum stated true facts (R. 413).

Appellants based their entire case upon certain findings which they claimed a psychiatrist Dr. Butz had made (R. 333-334, 395, 315, 505). They then advised the Court that they *would not* call Butz as a witness (R. 391-392) although his address is given in a deposition taken for discovery purposes as Silver Spring, Maryland (R. 1175), and they did not say that he was unavailable to them as a witness. Appellants' other most essential witness was the Acting Administrator of the Federal Security Agency, J. D. Kingsley, who made the last three (and only presently effective) decisions authorizing multiple seizures (R. 1532-1541), and under which Appellants threaten to make further seizures. But Kingsley was not called as a witness and was not claimed to be unavailable to Appellants, although he had given an incomplete deposition and had said he did not know just which "version" of the Appellee's pamphlets he read before making the three decisions condemning three different pamphlets but he read only one version (R. 504, 505, 512-513).

Because of the admissions, and the unusual action referred to shortly wherein Appellants offered many facts against themselves, Appellee offered only four of the 17 witnesses whom it advised Appellants it might call.[40] William S. Casselberry, President of Appellee, gave a detailed account of contacts between Appellee and Appellants, together with an outline of the care with which the pamphlets

[39] R. 269-270, 271, 329-330, 385, 507.

[40] R. 532. Question 10, answered R. 535, item 10.

condemned by Appellants were prepared (R. 28-72). Dr. John A. Myers of Baltimore, a specialist in vitamin, mineral and nutritional subjects, then gave expert testimony supporting all of the statements contained in the pamphlets as true, accurate and not misleading from a medical viewpoint (R. 72-91). Mr. Roger A. Truesdail, an expert chemist, then gave his opinion (R. 283-286) that the product held by Appellants would be unsalable when returned to Appellee because of deterioration in potency of some of the contents (R. 286). Mr. Lee J. Myers, a member of the bar of California and an attorney whom the Appellants refer to as an expert specialist in this field, (R. 1026, 1029, 65, 269) then gave his opinion that from a legal viewpoint the pamphlets complied in every respect with the Act. (R. 247-267). His background and experience are of such a nature that he was as well qualified as Dunbar, Larrick, Crawford and Kingsley to give an opinion on the character of Appellee's labeling. He is the attorney who supervised the rewriting of the pamphlets and who repeatedly asked Appellants to tell him if they found anything wrong with the pamphlets so that it might be corrected (R. 1026, 64-65).

The Findings of Fact set forth the foregoing so concisely that it is believed unnecessary to go into more detail about Appellee's evidence and Appellants' many other admissions.

The Appellants' witnesses were so confined in their testimony by the admissions previously referred to that the testimony of Appellants Dunbar, Crawford and Larrick merely reiterated what they read, *or failed to read,* in making their decisions authorizing multiple seizures, and the facts surrounding the making of their decisions already referred to herein. See *supra* pages 13 to 18. On the medical side, Appellants called Dr. Jeghers, whose testimony was so in favor of Appellee's position that Appellants then sought other medical testimony. He agreed (R. 368) that Dr. Wilder of Mayo Clinic, who has written much

that confirms what Appellee says in its pamphlets, (R. 957-958, 50-51) is an expert in this field (R. 957-958) thus contradicting Dr. Nelson, another of Appellants' witnesses. (R. 495, 1509).[41] Appellants' next witness was Dr. Blankenhorn. When counsel for Appellants asked questions about the statements in the so-called findings of fact attributed by Appellants to Butz, Dr. Blankenhorn created a major explosion in the courtroom by saying he could not answer the questions yes or no in the way Appellants' Counsel wanted him to (R. 438). Appellants then immediately took Dr. Blankenhorn off the stand in great consternation and confusion (R. 438).

Appellant's final medical witness was Dr. Walter K. Myers (it is only fair to advise the Court that none of the three Myers who testified in this case are believed to be either related or acquainted in any way). He testified that Counsel for the Appellants told him Nutrilite "was being sold with a claim for curing the disorders that have been mentioned." (R. 479). Those mentioned were the ones listed in the findings attributed to Butz (R. 472-478). Apparently deciding that this gave a bad impression, he then said that he got some of his information from his patients and from advertisements of Nutrilite which he had seen in newspapers and magazines. (R. 483). When confronted with the fact that Nutrilite has never been advertised in any newspaper or magazine he, in an embarrassment obvious from the record, said he would have to change his testimony as he had seen no advertisements. (R. 484).

The final witness for Appellants was a Dr. Nelson, a chemist, not an M.D., and head of the vitamin division of the Food and Drug Administration. He first admitted that his attention was initially called to Nutrilite by the American Medical Association and then sought to change his story on this. (R. 1502, 499-500.) Evidently the Appellants placed no reliance upon him themselves, because he testified that

[41] Nelson there testified that Wilder was unqualified.

none of them consulted him before they made their decisions condemning the pamphlets herein (R. 500), although such questions normally came under his jurisdiction (R. 1496). He had to admit that he had given an *untrue* statement *under oath in this case* in support of Appellants' motion to dismiss when he had said that the value of Vitamin K had not been established (R. 490-491). As already stated, he disagreed with Appellants' witness Dr. Jeghers about the qualifications of Dr. Wilder of Mayo Clinic as an expert in the field of vitamins and minerals, and disagreed with the outstanding expert in the United States on the mineral content of soils as affecting mineral content of plants (R. 498).[41] In general his testimony was such that in view of his admitted untruth when trying to help Appellants to get Appellee's complaint dismissed, the Appellee asked the Court to disregard his entire testimony.

Another remarkable thing about the trial, other than Appellant's failure to call Butz and Kingsley, was the fact that Butz named four medical doctors with whom he consulted in the Food and Drug Administration about vitamins and minerals (R. 1179-1180) (but not about Nutrilite), and none of these "experts" were called by Appellants.

---

[41] Further evidence refuting Dr. Nelson's testimony that mineral content of soil does not affect mineral content of plants is found in an article entitled "Home on the Grapefruit Range" in the February, 1950, issue of READER'S DIGEST, where the following statement appears:

> "One last problem remained. Even in fertile Florida, where all you have to do is drop a seed and leap out of the way, there were green pastures where cattle stayed skinny and a lot of them starved to death. Scientists of the state university's Agricultural Experiment Station studied grasses and soils from such pastures and discovered that they lacked essential body-building minerals. When the scientists added iron, copper sulphate and cobalt to the diet of the sick and starving cows, the cows got well. Today minerals are mixed with the seeds of new tropical grasses and sprinkled from airplanes over miles of freshly cleared land. Grasses thus grown contain the minerals."

The most astonishing phase of the trial, however, was *Appellants'* action in closing their case by offering in evidence 25 separate items of arbitrary conduct compiled by Appellee prior to the trial as an answer to an interrogatory (R. 531-535). This evidence—all most damningly against Appellants—having been most amazingly offered by them is certainly evidence for all purposes in this case and having offered it Appellants must admit it is true as they offered nothing to contradict one word of it. This evidence states that Appellants acted arbitrary, unlawfully, oppressively, unreasonably, in excess of their powers under the Food, Drug and Cosmetic Act, and for the purposes of harassment, by the following:

"(1) The rendering of three secret unlawful decisions in September and December 1948, that the labeling of plaintiff's product was misleading;

(2) The carefully concealed fact from plaintiff that such secret decisions had been unlawfully made by the defendants, such fact being first revealed to plaintiff on January 17, 1949;

(3) The inflicting of irreparable injury on plaintiff by such decisions;

(4) The deliberate increase in plaintiff's irreparable losses by the unreasonable failure to procure the dismissal of all but the first libel for condemnation or seizure action after all but the first thereof had been judicially declared void and illegal;

(5) The denial by the Acting Administrator of the Federal Security Agency of plaintiff's requests for opportunities to be heard upon the question of whether the labeling of plaintiff's product is misleading in a material respect, to the injury or damage of purchasers or consumers;

(6) The further rendering *ex parte* by the Acting Administrator of the Federal Security Agency of unlawful decisions that the labeling of plaintiff's product is misleading, to the injury or damage of the purchaser or consumer where no facts exist which show that such was, in fact, the case;

(7) The rendering of such *ex parte* decisions by the

Acting Administrator of the Federal Security Agency that the labeling of plaintiff's product was misleading, with full knowledge of the total and ruinous consequences to plaintiff of such decisions;

(8) The deliberate and arbitrary refusal of defendants to stipulate to the removal of the pending libel for condemnation or seizure actions to the district in which plaintiff does business;

(9) The unreasonable interrogation by defendants, or their agents and employees, of many of plaintiff's distributors and customers with the resulting damage to plaintiff's business and good will thereof and interference with and retardation of the efficiency and morale of plaintiff's sales and distribution organization.

(10) The placing, or causing to be placed, of embargoes upon plaintiff's product in widely scattered jurisdictions of the United States so deliberately planned and calculated as to injure plaintiff;

(11) The giving of untrue information to secure said embargoes;

(12) The carefully designed geographic pattern of the libel seizure actions so as to unnecessarily punish plaintiff;

(13) The deliberate and unnecessary punishment of plaintiff by inflicting unnecessary expense through the institution of numerous libel for condemnation or seizure actions in widely separated and far-flung jurisdictions in the United States;

(14) The oppressive and unreasonable threats by defendants to institute still further libel seizure actions in other widely separated and far-flung jurisdictions in the United States;

(15) The deliberate violation of defendants' agreement not to make multiple seizures of plaintiff's product, upon the ground that such agreement only applied to seizures of plaintiff's product in Los Angeles;

(16) The issuance of instructions to allow the Buffalo seizure to be removed no further than the midwest;

(17) The rendering of opinions and the provision of unfavorable and injurious information by the defendants to private individuals and organizations with respect to the labeling of plaintiff's product, without either prior or subsequent notification to plaintiff;

(18) The unreasonable volunteering to magazines and newspapers of information in a way which would most injuriously damage plaintiff;

(19) The repeated violation of implied agreements to advise plaintiff of instances in which defendants deemed the labeling used by plaintiff to be in violation of the Federal Food, Drug, and Cosmetic Act and the regulations issued thereunder;

(20) The deliberate efforts of defendants to seize only 'large' amounts of shipments of plaintiff's product, so as to make plaintiff's losses as large as possible;

(21) The deliberate punishment of plaintiff by requiring the employment of attorneys and the provision of cost bonds in those far-flung jurisdictions in which seizures were made of plaintiff's product, knowing full well that plaintiff could consolidate all of such actions and the only accomplishment of said numerous actions would be the loss of such monies so expended by plaintiff;

(22) The secret infiltration of plaintiff's organization by defendants' agents and employees in entrapment attempts in order that information respecting plaintiff's operations might be constantly and instantly furnished defendants;

(23) The threat to incarcerate plaintiff's Seattle, Washington, distributor over the 1948-1949 New Year holiday if certain goods were not immediately produced by said distributor;

(24) The calculated action of defendants in refraining from instituting libel proceedings in the Southern District of California of products known to defendants to be in the possession of the Post Office Department and other common carriers for interstate shipment through which plaintiff was prevented from exercising its absolute right to remove the multiple seizure actions to such Southern District of California;

(25) The refusal and failure of defendants to indicate to plaintiff wherein the labeling of Nutrilite was claimed to be misleading, or to provide an opportunity to revise such labeling, all of which led plaintiff to the belief that the labeling was, in fact, acceptable to the Food and Drug Administration."

When Appellants closed their case with these 25 admissions Appellee called no rebuttal witnesses and immediately closed its case (R. 537).

Under these conditions is it any wonder that Appellants do *not* assert lack or insufficiency of evidence to support the Findings of Fact herein? They simply cannot do so.

5. Appellants' Own Investigations Reveal That Under Customary Conditions of Purchase and Use Purchasers and Users Are Not Misled by Appellee's Pamphlet

(a) The Statutory Test

The statutory test to be applied to Appellee's pamphlet—and this pamphlet constitutes the sole objection of Appellants to Appellee's business (Fdg. 7, R. 757, Fdg. 42, R. 770) is the interpretation placed upon it by purchasers and consumers under customary conditions of purchase and use.

Section 201 of the Act on the construction of labeling refers to "under such conditions of use as are customary or usual." Section 403 (f) refers to the requirement that labeling be in "such terms as to render it likely to be read and understood by the ordinary individual under customary conditions of purchase and use." Sections 503(c) and 602(c) contain identical language. Appellants Dunbar, Crawford and Larrick, and J. D. Kingsley, who acted for Appellant Ewing, all cited this as the test in making their claim that the pamphlets represented Nutrilite as a cure for serious diseases. (Crawford, R. 375; Dunbar, R. 311; Larrick, R. 395; Kingsley, R. 507). "In making that survey of labels (labeling) it is always my effort to place myself in the position of the individual who is going to read that label (labeling) and attempt to determine what impression . . . that labeling will make on the person—the customer or purchaser—who reads that label (labeling)" (Dunbar R. 310-311). The testimony of the others is in substance

the same as to the test of customer and purchaser reaction which must be applied.

Appellee has always contended that purchasers and consumers would not place the interpretation upon its pamphlets that Nutrilite is offered as a "cure" of diseases contended for by Appellants (Appellant's Brief 19, 20, 94). The pamphlets do no more than discuss diet and nutritional deficiencies due to the lack of vitamins and minerals in ordinary diets (Fdg. 12(e) R. 759). The chief causes of this deficiency are given as soil depletion and canning and refining processes (R. 908-911). The pamphlet then discusses the need to add a product like Nutrilite as a supplement to the diet to overcome these deficiencies of vitamins and minerals. Appellants ordered the Minnesota survey (R. 39-47, 929-939), already discussed herein, made for the specific statutory purpose of obtaining from purchasers and consumers their impressions of the pamphlets under customary conditions of purchase and use. Inspector Anderson of the Food and Drug Administration made the survey in Minnesota by talking to purchasers and users of Nutrilite who had bought the product after reading the pamphlet. The survey reveals that consumers unanimously reject the contention that Appellee's pamphlet is misleading to them (R. 929-939.)

(b) "None of Them Thought That Nutrilite Was a Cure for Anything But Merely Vitamins and Minerals Which Would Build Their Bodies Up"

This is what the official Inspector of the Food and Drug Administration reported back in part as to the impressions of purchasers and consumers of Appellee's product who read the pamphlet before buying the product (R. 40):

> "All people I talked to including Mr. Quale, the (Appellee's) Distributor, were very friendly and cooperative. None of them thought that Nutrilite was a cure for anything but merely vitamins and minerals

which build their bodies up. None of these people were the rabid health addicts that one so often comes into contact with in an investigation of this type."

Of one purchaser and user the Inspector reported (R. 42):

"She said at the time she signed up for the course Mr. Quale gave her the booklet, 'How to Get Well and Stay Well' and she had read this booklet and given it back to him. When she started using Nutrilite she did not think she was getting a cure. . . .

"I asked Mrs. West if she thought Nutrilite was a cure-all or something wonderful, and she said she believes it has helped her very much but does not know if it will cure anything. It would appear that Mr. Quale did not make any wild claims to Mrs. West and that she was not led to believe that the product was anything more than vitamins and minerals which would help to build her body up.

"James E. Anderson, Inspector."

The reports of other interviews with purchasers and consumers are of like import, all specifically refuting Appellants' "cure interpretation" opinions as each purchaser interviewed was specifically asked whether the pamphlet gave him the impression Nutrilite was a "cure" and all said *no* (R. 41-47).

If Appellants' "unreasonable"[42] interrogations of Appellee's customers and distributors and Appellants' other investigations (including "secret infiltration of Plaintiff's organization by Defendants' agents and employees in entrapment attempts in order that information respecting plaintiff's operations might be constantly and instantly furnished defendants")[43] described in the record had revealed any evidence disputing this Purchaser survey, it is a reasonable inference that after Appellee offered the Purchaser survey Appellants would have offered this other

[42] R. 532, item (9).

[43] R. 533-534, item (22)—admittedly true as Appellants themselves offered it in evidence (R. 531).

evidence to rebut the conclusions of their own Inspector. Cf. *Baltimore and Ohio R. Co.* v. *United States*, 298 U. S. 349, 381. If the Inspector could have cast doubt on his own report one can be sure Appellants would have had him testify.

We therefore have Appellants recognizing the test which should be applied to Appellee's labeling, applying that test and finding it against them, then arbitrarily and capriciously ignoring these facts in Appellee's favor—which were all the facts Appellants had—and ordering that havoc be wrought upon Appellee's business by oppressively carrying out multiple seizures of its product on a far-flung nation-wide basis.

6. The Appellants' Brief Chiefly Devoted to an Ancillary Issue Rather Than Main Issues in Case

In sum, the Appellants' brief argues that the statutory words here involved authorize them to do the "unfair," "drastic," "harsh" and "shocking" things they have done in this case,[*] but that the statute is nevertheless constitutional as the due process clause does not prohibit their unlawful, arbitrary, capricious and oppressive conduct thus allegedly authorized and set forth in detail in the Findings of Fact of the trial Court.

Appellants quarrel in substance with only one of the 43 Findings of Fact. The Finding singled out for special attention is No. 12 (R. 758-760) wherein the Court found that the three pamphlets involved in this case are not misleading, saying in part:

> "The beneficial effects of vitamins and minerals for nutritional deficiencies is a well established medical fact. Many of the statements in the pamphlet about the beneficial effects of particular vitamins and miner-

[*] The quoted words are those of Judge Pine. See Finding 34, R. 767.

als for nutritional deficiencies are confirmed by the admissions of the defendants herein (R 273-283).

"The three pamphlets (P's. Exs. No. 1, 2 and 3), when read as a whole and fairly interpreted, without lifting statements therein out of context, do no more than represent that Nutrilite is a vitamin-mineral food supplement designed and intended to build up the bodies of human users thereof in order that it may aid nature to help the users enjoy better health through better nutrition. Said pamphlets do not represent to the minds of ordinary, reasonable and prudent persons that all of the symptoms, conditions and diseases of the human body necessarily or generally result from dietary deficiencies alone, or that all of the symptoms, conditions and diseases of the human body can be prevented, cured or treated by the use of Nutrilite, and said pamphlets do not represent, suggest, or imply that Nutrilite is a medicine or drug, or that it is efficacious or beneficial in the prevention, treatment, or cure of all diseases.

"These pamphlets represent the product only as a food supplement containing vitamins and minerals beneficial to building up health and bodies and in alleviating, in some but not in all instances, symptoms resulting from vitamin and mineral deficiencies in the diet. Purchasers and consumers do not understand from these pamphlets that Nutrilite is a treatment or cure for any disease. The defendants' own survey to determine the impression gained by purchasers and consumers of the representations contained in these pamphlets under customary conditions of purchase and use reveals that the users interviewed uniformly came to these conclusions and understandings of the statements in the pamphlets."

Having devoted practically their whole case to an attempt to establish the contrary of these facts by opinion testimony, as compared with actual facts on consumer impressions offered by Appellee, and having lost on the merits, Appellants now say the trial court should not have con-

sidered and decided this matter as an incidental or ancillary issue to the two major issues in the case.

Appellants, knowing the findings of fact are all against them after a careful consideration of the evidence by the trial Court, from the outset to the end of their brief attempt to twist meanings of words, draw unfair inferences from words, excerpt phrases, parts of sentences and words out of their setting, argue that mere illustrations (clearly not intended otherwise) are unfair representations when a fair reading indicates the contrary,[45] and in general they attempt to mislead the Court into disagreeing with the Trial Court on the evidence on this one ancillary issue of the character of the pamphlets and attempt to get this Court to "try the case *de novo* on the record." *United States* v. *Yellow Cab Co.*, 70 Sup. Ct. 177 (Dec. 5, 1949). Never do Appellants, except in one little footnote,[46] admit that from their own files there came the most damning of evidence as to the *actual* reaction of consumers and purchasers to these pamphlets.[47] As explained *supra*, pp. 27-28, consumer reaction is the test whereby all such labeling is to be measured under the Act. Never do Appellants reveal in their brief that this official survey which *they ordered made pursuant to the statute*[48] proves that all their unfair arguments *are 100% wrong.*[49]

Under Rule 52 of the Federal Rules of Civil Procedure the Findings of Fact of the Trial Court should be upheld "unless clearly erroneous." *United States* v. *Yellow Cab*

[47] Plaintiffs' Exhibit 4, R. 38-47, 929-939.

[48] See *infra* page 54.

[49] See *infra*, "Who Is Acting Honestly, Fairly and in Good Faith in this Case?", p. 40.

Co., supra.[49a] Reference to the entire record herein shows only a rejection of unreasonable arguments and opinions of Appellants—not of any facts because all the facts are against them and the Court so found. And insofar as the merits of the pamphlets actually involved in this case are concerned, the Findings of Fact are in favor of Appellee by an acceptance of Appellee's testimony and a rejection of Appellants. *National Labor Relations Board* v. *Pittsburgh Steamship Co.*, 337 U. S. 656, 659. Appellants offered *no* testimony to contradict their own survey of consumer reaction, just referred to,[50] so the only facts in the record were left uncontradictedly in Appellee's favor.

The Findings of Fact insofar as the arbitrary, capricious and oppressive conduct of Appellants is concerned are mainly based upon *uncontradicted* testimony and admissions of Appellants. They do not and cannot quarrel with the Findings on that conduct. Never do Appellants in their brief even attempt to defend this conduct *because they know they have no defense* to such action. As major examples only of this unmentioned and undefended conduct (details and other such conduct are found in the Findings of Fact of the Court), Appellee has stated the 22 major acts in a preceding section herein (pp. 13-19).

7. Appellants' "Statement" in Their Brief Is Misleading as to the Facts and Issues

Appellants' legal arguments are considered herein under the appropriate sections of this brief.

Appellants in the part of their brief entitled Statement (pp. 5-25) in many instances misstate the facts of record and often state facts not supported by the record or re-

[49a] Rule 52 provides: "Findings of Fact shall not be set aside unless clearly erroneous, and due regard shall be given to the opportunity of the Trial Court to judge of the credibility of the witnesses." On credibility see *infra* pages 40-41.

[50] *Supra*, note 47.

jected by the trial court because of lack of credibility of particular witnesses for Appellants. While many of the misstatements by Appellants are not serious in and of themselves, they combine to create a total impression of Appellee's business and the facts involved in this controversy which is completely erroneous and misleading.

Appellants in the first paragraph of their "statement" create the impression that Nutrilite is sold *entirely* by the use of the booklet "How to Get Well and Stay Well" by salesmen going from door to door. This is not so. The references in the record by Appellants certainly do not support this impression. In fact, the record reveals that the majority of sales are *not* made through the use of the booklet or door to door sales, (R. 56, 213-214), but rather through consumer recommendations and referrals. The trial court found that only about 40% of the *initial* sales to customers were made by use of the pamphlet (R. 757).

Appellants also create the erroneous impression that Nutrilite is sold on a contract basis, stating, in effect, that each customer enters into a "contract" to purchase two hundred dollars worth of the product. This is also untrue. While it is true that is is recommended that the use of the product be over an extended period of time in order to obtain adequate results (and the medical testimony bears this out (R. 107)), sales ordinarily are on a month to month basis (R. 213-214). The only testimony concerning a $200 contract is a statement by Appellant Dunbar as to what A. G. Murray *told* him (R. 315). (The attitude of Murray is reflected in Appellee's Exhibit 16, the so-called "Pressure memorandum", R. 1030a, 67-69). No evidence of unreasonable price was offered by Appellants in this case, and they know that for the 16 vitamins and minerals in Nutrilite, plus its unique base, the price is most reasonable. Yet, they create an opposite and untrue inference.

The second paragraph of Appellants' "statement" (Brief pp. 6-8) is devoted to a discussion of the pamphlet

claimed at one point in the record by Appellants' counsel to be involved in the California indictment of 2 of Appellee's officers (R. 297). Counsel for Appellee pointed out that this pamphlet was not before the Judge out there, but is merely a part of the evidence which the Government says it will offer when that case is tried[51] (R. 298). Appellants neglect to say that *this booklet is not involved in the instant case in any way, was not used as a basis of the decisions authorizing multiple seizures, and was in fact discontinued many months prior to the seizure actions which gave rise to this controversy.* Also, the claim (P. 6 Appellants' brief) as to the actual charge made in the indictment as "deliberately misrepresenting the therapeutic value of Nutrilite" is not supported by the record herein but is a gratuitous statement by Appellants of a kind they sprinkle freely all through their Brief.

Appellants offered no evidence that any of the Appellants herein ever knew of the indictment or the pamphlet they say the Government will offer in support of the indictment, or that any of their actions involved in this case were taken as a result of or were based upon the pamphlet or the indictment.

Appellants say the charge in the libel papers is "false labeling representations" (p. 9, Brief) and again the record references they cite do not contain these words at all, nor does any other part of the Record herein.

Appellee will consider the statements about Appellants Crawford, Larrick and Dunbar and the psychiatrist Dr.

---

[51] The Federal Judge before whom this indictment is pending has not set the case for trial, after first continuing it at the request of the Government (Finding 24 R. 764) as the Judge says the trial would be a waste of money (R. 1037) since the pamphlet allegedly used there admittedly was discontinued months before the indictment was returned, 14 months after the hearing thereon. (Finding 9, R. 757; Finding 14, R. 760.)

Butz they now say they relied upon, *infra,* pages 57-60. Suffice it to say here that the brief's statements (pp. 18-21) about them are an almost complete misstatement of the evidence and findings of fact in this case. The Court's attention is called to the fact that they omit Kingsley entirely in their outline of the decisions; yet his are the *only presently effective decisions,* as Judge Pine invalidated those by Crawford, Larrick and Dunbar and they took no appeal from his decision. (Fdg. 34, R. 767.) Also, only the 42 page pamphlet is now in use (R. 52) yet Appellants base most of their discussion on the 58 page pamphlet, use of which was discontinued on October 11, 1948—18 months ago (Fdgs. 19-20, R. 762-763).

Appellants also attempt to create the impression that four libels were based upon the 58 page booklet, one libel on the 36 page booklet and five on the 42 page booklet. An examination of the references to the record cited by Appellants in support thereof not only fail to support these statements but the testimony of Appellant Larrick is to the effect that more than one seizure was based on the 36 page booklet he condemned *ex parte* (R. 408).

Appellants in speaking of the action denying their first motion to dismiss the complaint, state (p. 12) that "Judge Pine questioned the authority of Appellants Crawford, Larrick and Dunbar to act on behalf of the Federal Security Administrator in making the determinations of probable cause." This is a masterpiece of understatement. Judge Pine not only "questioned" their right to make the decisions but in fact held that they were *unauthorized* and *unlawful* (Finding 34, R. 767, 593).

Appellants state on page 13 that "on April 14 notices to take depositions were served" on named individuals. Their next sentence states that "the notices were followed by the service of subpoenas *duces tecum.*" This is in error. Appellee simply served notices and subpoenas commanding the named individuals to appear for the taking of deposi-

tions. The same subpoena, pursuant to Rule 45 of the Federal Rules of Civil Procedure, commanded the production of certain reports, and correspondence to be used during the course of the depositions. At no time did Appellee serve subpoenas *duces tecum* under Rule 34 of the Federal Rules of Civil Procedure.[52] (See R. 743-745.)

Appellant's statements about Appellee's evidence consisting of Appellants' own admissions are considered *supra* pp. 19-20.

Appellant's attempt in their brief (pp. 15-16) to undermine and twist the medical testimony of Dr. John A. Myers of Baltimore is particularly to be condemned. An examination of the record in this case will disclose that he was the outstanding medical expert at the trial.[53] At no time did Dr. Myers testify, as Appellants would lead this Court to believe, that "common dietary deficiency diseases" are "peptic ulcers, cold, sinusitis, colitis, eye trouble, ... pneumonia, cancer" etc. An examination of the record cited by Appellants on this point will disclose that they are guilty of a serious misstatement and that here as always they were asking what Dr. Myers as a doctor might conclude from certain lengthy medical terms, not appearing in the pamphlets but conjured up by Appellant's Counsel. For hour upon hour Counsel for Appellants sought to put such words in Dr. Myers' mouth but for hour after hour

---

[52] Appellants cite the fact that a motion to quash the subpoenas was denied by Judge Clark, one of the three Judges. At no time did Appellants seek to have Judge Clark's order reviewed by the full three-judge court, yet Section 2284, Title 28, U. S. C., specifically provides for such an appeal from the action of a single judge. They therefore have waived this objection (it is of no merit anyway) by failing to exhaust their statutory remedy. See *infra* page 168.

[53] It is significant to note that Appellants produced four expert witnesses. Two of them admitted stating erroneous facts under oath (R. 482-484, 490-491); another could not agree with the findings by Butz (R. 438, 435).

he patiently explained how inapplicable such scary undreamed of diseases are to the product and pamphlets before the Court (R. 92-183). Never would any ordinary purchaser reading the pamphlets think of any of the diseases Counsel for Appellants cross-examined Dr. Myers on at great length, and certainly none of those diseases are mentioned directly or by implication in the pamphlet. See for example page 113 of the Record where Appellant's question Dr. Myers on endocarditis, pericarditis, angina pectoris, aneurism—on other pages of Dr. Myers cross-examination (R. 92-183) similar questions are asked on other such names no ordinary purchaser would know.

The references to Dr. Truesdail are erroneous (P. 14, n. 8, p. 43, n. 15) as he in fact testified at the very part of the record cited by Appellants that he recommends against sale of a vitamin product like Nutrilite after it had been packed for six months, not the year stated by Appellants (R. 285-286).

Reference is made to the deposition of Acting Administrator Kingsley (R. 501-518) stating "he had examined the editions of 'How to Get Well and Stay Well' upon which his determination was based" seeking to convey the idea that he read each of the three editions. Appellants are completely cognizant of the fact that Kingsley did *not* read the three editions of the booklet upon which his determinations were based but relied upon a *single unidentified* pamphlet, saying "I am uncertain as to which version I read" (R. 505, 513).

It is worthwhile to note that the Appellants who have violated all the rudiments of fair play seek to extol their years of "experience" and "utmost good faith" as conclusive evidence of their *inability* to act arbitrarily and capriciously. (Pp. 18-21 of Brief.) It is not uncommon for administrative officials to raise such a cry in defense when their actions are challenged.

Appellants attempt (pp. 23-25) to recite the basis for the

finding of the Court below that Appellants acted arbitrarily and capriciously in reaching their decisions of probable cause. Few, if any, of those facts were relied upon by the Court in reaching their conclusion. In a footnote Appellants refer to the "secret indictment" in California as being part of the arbitrary conduct of Appellants. (Page 25, note 11.) This, of course, is ridiculous and was not so considered by the Court below. Most of their other criticisms are of like character, and they did not discuss the actual Findings of Fact of the Trial Court in any attempt to show that under Rule 52 of the Rules of Civil Procedure they were "clearly erroneous." See *United States* v. *Yellow Cab Co.*, 70 Sup. Ct. 177 (Dec. 5, 1949), and *supra* note 49(a).

8. Appellants in 10 Years Surveillance Unable to Develop One Fact Justifying Seizures

One very remarkable thing which Appellee wants to call to the attention of the Court, without laboring the point, is that Nutrilite has admittedly been under the surveillance of Appellants since 1939, according to its own records (R. 387). Under Section 704 of the Act everything in connection with Nutrilite's manufacture and sale has always been subject to the most rigid inspection by the Food and Drug Administration, as are all similar products manufactured by other companies. Appellants' Counsel have stressed that they have made a most thorough investigation in this case (R. 16) and reference has already been made to the terrific and extensive interrogation of Appellee's distributors and customers.[54]

From all of this record it is most remarkable that Appellants who made decisions authorizing multiple seizures had before them no evidence of complaints and no facts of any kind critical of Appellee, its product or its labeling

[54] *Supra*, page 25.

(R. 269-271, 329, 330, 385, 507). We then come up to the time of the trial in the instant case with Appellants knowing for approximately 10 months that it would be necessary for them to show some facts justifying their actions herein, but again Appellants present nothing except arguments about words and inferences therefrom, which inferences they knew purchasers and consumers do not draw because their own survey of the impressions of purchasers and consumers had so informed them (R. 39-47), *supra* page 28.

9. Who Is Acting Honestly, Fairly and in Good Faith in This Case?

One further general comment on Appellants' brief is in order. At several places they question Appellee's honesty (p. 34, 98) and good faith (p. 97, 98). Six different Federal Judges have been most critical of Appellants and their actions affecting this case.[55] Yet Appellants seem to still feel they have a special license to impugn and smear us. In their Brief, as throughout this litigation, they make their charges with no evidence of any kind to support them. With some reluctance, but nevertheless, because of Appellants' tactics in their brief, Appellee calls the attention of the Court to three instances which, to say the least, cast some reflection upon the *honesty* of three of Appellants' chief witnesses:

> 1. Dr. Elmer M. Nelson, Chief of the Vitamin Division of the Food and Drug Administration whose duty it is to pass upon labeling of vitamin products (R. 1496) but who nevertheless was never consulted by any of the Appellants prior to their decisions herein (R. 500) signed an affidavit under oath in support of Appellants' Motion to Dismiss in this case stating that the need for Vitamin K in human nutrition had not been established. The other experts in this case testified

[55] R. 767 (Pine), R. 756-771 (Clark, Goldsborough, Tamm); R. 1051 (Fake), R. 1037 (Harrison).

to the exact contrary (R. 84-85, 355). Nelson himself has twice admitted his sworn statement was untrue (R. 491, 1519). If the lower court had sustained the motion to dismiss acting on the basis of this absolute falsehood just because told by Nelson, relying on his background and official position, a terrific injustice would have been inflicted. Is this honest?

2. Appellant Larrick signed an answer under oath to an interrogatory on behalf of all the Appellants stating that Appellant Dunbar *had* seen or heard of complaints against Appellee and after Appellant Dunbar denied this under oath (R. 329), Larrick was forced to retract this untrue statement (R. 406-407). Is this honest?

3. Witness Walter K. Myers of Appellants testified he received information about Appellee's product and labeling from "advertisements," then was forced to admit he had never seen any advertisements of any kind (R. 483-484). Is this honest?

When Appellants start writing about honesty and good faith in this case they should also recall the facts found by three judges in this case. A reading of those findings would never suggest honesty, fairness and good faith on the part of Appellants herein. These judges found these facts after observing the demeanor of three of Appellants on the stand, and after considering Appellants' refusal to put their chief scapegoat psychiatrist on the stand or to call as a witness J. D. Kingsley who did many of the things listed in the 22 points, *supra*, pp. 13-18, in the name of Appellant Ewing. Was their violation of an agreement they made to get a continuance of the trial of the indictment case an honest act? (Item 16 *supra* page 17.) Was their deception in adroitly leading Appellee to believe its labeling unobjectionable to them while secretly, at that very time, planning to unleash their pressure and punishment campaign of nation-wide multiple seizures an honest act? (Items 19 and 25 *supra* page 26.) Perhaps one should not say such things about Government officials, but when those

Government officials repeatedly attack the honesty and reputation of citizens to distract attention from real issues it seems high time that the truth is revealed.

In all the testimony of Appellants and in their brief they use the "scare" technique so ably explained by their *admitted* "expert" on the subject, J. D. Kingsley (R. 509). They tried to "scare" the Trial Court by conjuring up terrible sounding names of diseases which only doctors ever hear of and then twisting undreamed of impressions and general representations which no ordinary purchaser and consumer would ever have (R. 92-183) as is shown by Appellants' own survey of consumer reaction (R. 39-47).

Appellants' claim that the pamphlets offer Nutrilite as a cure for cancer because it is mentioned once in a disclaimer illustration in the pamphlet in the Foreward shows how extreme the interpretations of Appellants are. Judge Goldsborough asked Appellants' Counsel: "Your theory is that a reasonable mind would gather from the book that this medicine would cure cancer; is that what you have in mind?" The answer was: "Yes sir, absolutely" (R. 124). The language where cancer is mentioned is as follows:

> "Consider, for example, our title—HOW TO GET WELL AND STAY WELL. From this title do you conclude that we offer *every* person a means of getting well, whether he is breathing his last few breaths at the age of 110, on his death bed with cancer, in a diabetic coma or about to die of typhoid fever? If so, your conclusions are wrong. With the title of this book be sure to read the explanation on the title page, below the illustration. What we have tried to do in this book is show the average American, ill with the usual American deficiency ailments in the customary chronic manner, what may be the cause of his illness, and how he should proceed to get well and stay well.
>
> "Another example: When you read the title of this book do you assume that we are going to show you how to *stay* well, *in spite* of everything you do to the contrary? If so, it is also a wrong conclusion. You can

follow our suggestions contained herein, and still make yourself ill by drinking too much alcohol, by taking dope, by overdoing, by exposure or by denying yourself certain important items of diet, such as proteins or carbohydrates" (R. 885, 31).

The explanation on the title page is as follows:

"If your health is the result of dietary deficiencies, and IF you want to get well and stay well, be sure to read this book. Even IF you are sure your diet has nothing to do with your ailment, read this book now, because science is connecting more and more physical troubles with diet and nutrition. IF your health is good read this book and learn how to stay well" (R. 883, 31).

None of the so called medical findings attributed to Butz (R. 761-762), see *infra* pages 57-60, 73, claim that the Appellee's pamphlets offer Nutrilite as a cure for cancer and none of Appellents' medical doctor witnesses so testified, while Appellee's medical expert testified they made no such claim (R. 127). Yet Appellants cross-examined about cancer (R. 96-97, 160-162).

For hour after hour, the Appellants took equally extreme positions in their cross-examination on other incurable diseases having scary unpronounceable names which only the doctors ever heard of. (R. 92-183.) These names are not mentioned in the pamphlets, were undreamed of by its authors and no ordinary purchaser or consumer could possibly think the pamphlets promised that Nutrilite would "cure" the diseases mentioned.

While Appellants' actions throughout are shown by the record and the undisputed Findings of Fact herein to be a record of secret, furtive, carefully concealed actions deliberately designed to injure Appellee irreparably without an opportunity to eliminate suddenly sprung objections, Appellee earnestly believes that the Record and the Findings of Facts amply support the Court's finding of Appellee's

complete good faith, honesty of purpose and fairness throughout.[56]

Since Appellants' brief, as did their evidence at the trial, revolves chiefly around their charges about Appellee's labeling, this discussion of Appellee's honesty and good faith will be confined to that subject, although there are many other facts in the Findings of the Court which certainly establish such a conclusion as to Appellee with respect to its whole business—for example, the complete absence of any complaints where a business of large size is involved and where a most extensive and fruitless investigation has been made by Appellants to try and find unfavorable facts.

The record shows that prior to 1942 Nutrilite's labeling was regularly presented to the Food and Drug Administration for comment [57] and the record is devoid of any unfavorable comments. The Findings show that from 1942 to 1947 no change was made in Nutrilite's labeling.[58] In 1947 the Food and Drug Administration sent a notice to certain of Appellee's officers of a hearing under Section 305 of the Act relating to criminal actions, which notice specifically provided that it did not relate to action "involving the seizure of the article" in libel cases.[59] A hearing was held on this notice, at which certain general indications about Appellee's labeling were made by representatives of the Food and Drug Administration.[60]

Appellee was represented at the hearing by a lawyer whom the Director of the Litigation Section of the Food and Drug Administration has called an expert in this field (R. 1029, 65, 269) and this lawyer advised that the labeling would be rewritten under his direction to eliminate all pos-

[58] *Ibid.*

[59] *Id.* R. 757.

[60] *Id.* R. 757.

sible objections.[61] This lawyer communicated with the Food and Drug Administration about the rewriting of the labeling and its contents.[62] Five months were taken to rewrite the labeling in a most comprehensive fashion (R. 38). The rewritten labeling was carefully checked with Food and Drug Administration regulations (R. 51), pamphlets specifically approved by the Food and Drug Administration, such as the pamphlet "Facts You Should Know About Vitamins," Appellee's Exhibit No. 5 (R. 941-955, 48, letter of approval R. 48-49), and expert medical and scientific literature in the field (R. 37-38, 47-53, 257).

Appellee began the use of its new labeling in January, 1948 (R. 217) and thereafter learned that the Food and Drug Administration was interrogating its distributors and customers (R. 57-58). Appellee then called upon the Food and Drug Administration to inquire as to whether or not there were objections to its new labeling (R. 58, 728, 750). Appellee was advised that the investigation was merely "routine" and was not advised that there were any objections to its labeling (R. 58). At that time it is admitted that Appellee did tell the Food and Drug Administration that if it had any objections to its labeling or to any phase of its business at any time, it was Appellee's desire to eliminate such objections and that a notice to Appellee of any objections would bring about any changes desired (Fdg. 13, R. 760, Complaint and Answer, par. 9, R. 728, 750).

Without notifying Appellee of any objections to its labeling, Appellants caused the first seizure to be made in Belleville, New Jersey in the manner outlined herein *infra* page 48. The very day that Appellee received the libel papers and learned that Appellants were objecting to the last 20 pages of its 58 page advertising pamphlet (R. 61), telegrams were sent to its top agents throughout the United

---

[61] *Id.* 757-758.

[62] Finding 10, R. 758.

States ordering these pages cut out of that pamphlet.[63] Similar instructions were sent in writing to all of Appellee's distributors.[64]

A letter was dispatched to Appellants advising them of this deletion and a further request was made for an opportunity to comply with future objections if Appellants ever had any.[65]

Appellant Larrick then approximately two months later, without notifying Appellee that the 36 pages not questioned in the Belleville seizure papers were objectionable and knowing of the notice and request, authorized multiple seizures on the basis of those 36 pages not previously found objectionable without prior communication with Appellee (Fdg. 29, R. 765).

These facts showing Appellee's good faith are uncontradicted by any evidence offered by Appellants.

10. The Six Ex Parte Decisions of Appellants Were Arbitrary, Capricious, and Oppressive.

Of all the facts in this case, none are more firmly established by the voluminous record brought before this Court by Appellants than those facts which compel the conclusion that Appellants Crawford, Larrick and Dunbar as well as J. D. Kingsley, Acting Administrator of the Federal Security Agency, acted arbitrarily, capriciously and oppressively in arriving at their so-called administrative decisions which authorized the onslaught of multiple seizures of Appellee's harmless and, in fact, admittedly beneficial product.[65a] The circumstances under which the decisions in question were made, particularly in view of the tremendous and serious impact of those decisions upon the Appellee, are the epitome of unfair administrative action.

---

[63] Finding 19, R. 762-763.
[64] Finding 19, R. 763.
[65] Finding 20, R. 763.
[65a] See pp. 9-10 *supra*.

While Appellants assign as error (P. 26 Brief) the Findings by the Court below showing that the decisions of probable cause were made arbitrarily, capriciously and oppressively as being "clearly erroneous," they present no specific argument in support of this alleged error evidently realizing all too well that they could not find any arguments and certainly no evidence to uphold what Appellants have done. An examination of the record in this case discloses, on the contrary, that the Court's findings on this point (R. 756-771) are the only proper ones from the admitted and established facts of record. The actions and admissions of Appellants are discussed, *supra* pp. 13-17, 19-27.

(a) Crawford and Dunbar Merely "Scanned" or Read Parts of the Pamphlets in Question, No Honest Attempt Being Made to Read or Interpret the Pamphlets in Their Entirety

No one would question that the device of multiple seizures of a harmless and beneficial product is, to say the least, drastic and harsh. Nor should it be questioned that an administrative officer given the power to authorize such action which works such an enormous irreparable injury should give the matter his honest, fair and deliberate consideration before taking action. This should be particularly true where the determination is reached *ex parte* and where the effect of an erroneous determination would result to the knowledge of the officer, as was the case here, in irreparable damage of incalculable magnitude. Inherent principles of fundamental fairness contained in the "due process" clause of the Fifth Amendment to the Constitution would seem to so demand.

It would appear, then, to be fundamental, that before administrative determinations of the character involved here, there should be some honest and fair effort on the part of the administrative officer so charged to analyze and interpret the labeling in its entirety without lifting sen-

tences and phrases out of context, particularly when the labeling is admittedly the only basis of objection. Appellants in their brief recognize that such labeling should be "read" in its entirety (Page 84). Such, however, was not the case here, for Appellants Crawford and Dunbar admittedly based their decisions on a mere "scanning" of isolated sentences and phrases and a reading of certain parts of the labeling in question.

Appellant Crawford testified that the booklet "How to Get Well and Stay Well" first came to his attention on September 28, 1948, when he authorized the seizure action of October 6, 1948, in Belleville, New Jersey (R. 332, 383). At that time, he did not read the first 36 pages but read the remaining 20 pages (Fdg. 17, R. 761). On September 30, 1948, two days later, Appellant Crawford signed his determination authorizing multiple seizures (Fdg. 17, R. 761). On this date, Appellant Crawford made no effort to read the booklet in its entirety but merely scanned the booklet and looked through the file and signed the conclusion right then (R. 384). This evidence clearly discloses that Appellant Crawford's determination was not a decision reached after fair consideration of all the labeling before him but rather a condemnation of the labeling based upon material taken out of context.

The determination by Appellant Dunbar on December 9, 1948, was made under similarly shocking circumstances. Appellant Dunbar was informed by an administrative assistant, A. G. Murray, whose patent bias and prejudice against Appellee will be noted *infra*, pp. 83-86, that "he was considering a number of seizure recommendations" (R. 311-312). Upon the basis of representations by A. G. Murray and without reading the labeling in its entirety, Appellant Dunbar concluded that the labeling had a "tendency to mislead" (R. 315-316, Fdg. 30, R. 765-766). On this basis, Appellant Dunbar signed his determination which authorized and resulted in further wide-spread seizures.

The actions of Appellants Crawford and Dunbar in authorizing the drastic use of multiple seizures without taking the little time necessary to read the labeling in its entirety clearly evinces an attitude which, under the circumstances, is the antithesis of "fair play." This Court in *Kassin* v. *Mulligan*, 295 U. S. 396, aptly stated at page 402:

> "Arbitrary or capricious appraisal of evidence . . . is in legal effect failure to consider."

With the ruin of a reputable private business, upon which more than 5000 people depend for their livelihood, and the product of which thousands of users have obviously found beneficial, Appellants Crawford and Dunbar certainly should have considered fairly the matter before them rather than indulging in "short cuts" and "rubber stamping" which are anathema to due process and enlightened administrative action. In *Ohio Bell Telephone Co.* v. *Public Utilities Commission*, 301 U. S. 292, 305, in discussing "rudiments of fair play assured to every litigant by the Fourteenth Amendment as a minimal requirement," Mr. Justice Cardozo said:

> "There can be no compromise on the footing of convenience or expediency, or because of a natural desire to be rid of harrassing delay when that minimal requirement has been neglected or ignored."

(b) Three Determinations on Three Separate Pamphlets Based Upon a Reading of ONLY ONE Unidentified Pamphlet

On January 28, 1949, at the request of Appellant Dunbar, J. D. Kingsley, then Acting Administrator of the Federal Security Agency, after listening to Dunbar and his counsel (R. 503) in an *ex parte* proceeding made three determinations identical in language with the determinations of Appellants Crawford, Larrick and Dunbar,[66] declared un-

[66] See Appellants' Exhibit 23, R. 1532-1541, 518.

lawful by Judge Pine (Fdg. 34, R. 767). Obviously, Dunbar and his counsel were biased in supporting the decisions previously made by Appellants Dunbar, Larrick and Crawford. J. D. Kingsley's testimony by way of an incomplete deposition (R. 501-516), which was put into evidence by Appellants clearly reveals that he knew three separate determinations were requested, each being based on different booklets (R. 512-513). Despite the fact that three determinations were made, Kingsley testified that he read *only one* version of the booklet and was uncertain and hazy as to which version that was (R. 504-505, Fdg., R. 767-768). As a matter of fact, Kingsley testified that he did not know whether all three booklets were before him [see] (R. 505, 513, Fdg. 35, R. 767-768).

It is absurd to contend that the determinations of J. D. Kingsley, which sought to authorize continuation of the multiple seizure program to "keep a sustained pressure" on Appellee, were made in an atmosphere and in a manner which reflects that the determinations were fairly reached. When the matter was submitted to him and he was informed that three determinations were requested, every sense of fair play would seem to dictate that an attempt should have been made to consider the labeling relating to each determination. This apparently was a matter of complete indifference to Kingsley.

J. D. Kingsley's palpable abuse of the powers vested in him is made even more so by the fact that prior to his determinations he was twice requested by Appellee that if he was asked to pass upon its labeling he grant it an opportunity to show him that the labeling in question was not misleading in any respect. Furthermore, he was advised that an erroneous decision on his part would put Appellee completely out of business by further multiple seizure ac-

[see] Appellants in offering Kingsley's deposition withdrew all their objections to questions asked of him that such questions were probing his "mental processes." (R. 506-508).

tions.[67] Despite these requests and the information contained therein, Kingsley made no honest effort to appraise each booklet condemned by him or to be sure that he had the right booklets before him. It is obvious from these facts, and others which will be discussed hereinafter, that J. D. Kingsley did not give the matter his considered judgment but took it upon himself to make only a cursory examination of the matter before him *despite full knowledge of the serious consequences of his decision* as Appellee's communication advised him specifically of these consequences.[68] His conduct in the matter is not dissimilar to what the law designates as "willful misconduct,"[69] rather than of an ordinary reasonable and prudent person.

These facts on Kingsley are thus a perfect picture of an arbitrary administrator, badly advised by his biased subordinates bent upon supporting the decisions they had previously made, brushing aside information in his own files and available from Appellee, issuing a paper which would to his knowledge destroy the economic existence of thousands. Appellants now say he is unstoppable regardless of how he acted.

(c) All Six Determinations Made With No Facts Before Decision Maker Showing Injury or Damage to Any Purchaser or Consumer

Section 304(a) of the Act prohibits multiple seizures "except" when as a condition precedent "facts" are "found" and a decision made on those facts authorizing such seizure. The Administrator must have probable cause to believe "from facts found" that Appellee's product was being sold

---

[67] Complaint and Answer Paragraph 18(a), R. 732, 752. Finding 35, R. 767-768. See Appellants' Exhibits 8, 9, 10, and 11. R. 1163-1171, 298, 300.

[68] *Ibid.*

[69] See *Lacy* v. *Louisville & N. R. Co.*, 152 Fed. 134 (CCA 5th, 1907).

under labeling which is or would be "in a material respect" misleading to the injury or damage of the purchaser or consumer. The words "in a material respect," the word "injury" and the word "damage" must mean something. To have the volume of sales it has Appellee obviously has thousands of customers, and it is in evidence that it has more than 5000 distributors (P's. Ex. 16, 1030, 66-67). Appellants have conducted one of the most intensive and searching investigations of Appellee by interrogating its customers (R. 728, 750, para. 9). Even after this litigation started Appellants had nearly a year to dig up facts against Appellee yet they produced none at the trial and themselves offered evidence (R. 531) that Appellants were arbitrary and capricious in:

> "The further rendering *ex parte* by the Acting Administrator of the Federal Security Agency, of unlawful decisions that the labeling of plaintiff's product is misleading, to the injury or damage of the purchaser or consumer where no facts exist which show that such was, in fact the case" (R. 532, item 6).

And it is significant that Appellants Crawford, Larrick and Dunbar as well as J. D. Kingsley *admitted* that at the time they made their determinations they had no facts before them showing injury or damage to any purchaser or consumer of Nutrilite from its labeling, and they knew of no complaints from purchasers or consumers.[10] While not conclusive in and of itself as evincing a lack of probable cause on the part of those making the determinations, this total lack of consumer protests or complaints does become significant, however, when considered with the other actions of Crawford, Larrick, Dunbar and Kingsley in making their determinations and the circumstances surrounding the determinations. Consumer complaints against Nutrilite and

[10] R. 270, 385, 761 (Crawford); R. 271, 329-330, 765 (Dunbar); R. 270, 765 (Larrick); R. 269-270, 507, 767 (Kingsley).

its labeling obviously were non-existent and their absence should have put Appellants on some notice that the labeling was not misleading, despite the claims of prejudiced and biased subordinates. Although facts showing injury or damage were not known to any of those who made determinations of probable cause, all of those determinations recited that the labeling "*is* in a material respect misleading to the injury or damage of purchasers or consumers" (R. 1172, 1174, 1217-1218, 1534, 1535, 1541). It is inconceivable how such a determination could be justly made without at least some semblance of facts showing consumer reaction. Each of the Appellant's decisions say that Appellee's labeling "would be *and is*" misleading and "in a material respect." The shocking fact of this case is that the only consumer sampling conducted by the Food and Drug Administration revealed that the exact opposite was true, i. e., *that consumers were in fact not misled by the labeling* (R. 39-47), see *supra*, pages 28-30. The language of *Interstate Commerce Commission* v. *Louisville & N. R. Co.*, 227 U. S. 88, 91 is most appropriate:

> "A finding without evidence is arbitrary and baseless. And if the Government's contention is correct, it would mean that the Commission had a power possessed by no other officer, administrative body, or tribunal under our Government. It would mean that where rights depended upon facts, the Commission could disregard all rules of *evidence, and capriciously make findings by administrative fiat.* Such authority, however beneficiently exercised in one case, could be injuriously exerted in another, is inconsistent with rational justice, and comes under the Constitution's condemnation of all arbitrary exercise of power." (Italics supplied.)

Under the Act, the decisions authorizing multiple seizures must be based on "facts found" (Section 304(a)). The right to use multiple seizures thus was intended to depend on facts and Appellants admittedly had none. And as is stated

in the next section Appellants' only relevant facts were the opposite of their conclusions. Rule by edict and fiat has always been contrary to the principles upon which our Government is founded. Mr. Justice Frankfurter, concurring in *United States* v. *United Mine Workers*, 330 U. S. 258, 307-308.

Appellants were certainly not acting as reasonable and prudent men in making their decisions when the only facts in their files dictated the opposite conclusion to that reached.

(d) The Determinations Ignored and Were Diametrically Opposed to the Findings of Fact of Appellants' Only Known Official Investigation

Further evidence of the gross abuse of the extraordinary summary power vested in the administrative officials who made the determinations authorizing multiple seizures herein is to be found in the Findings of Fact of the investigation in Clarkfield, Minnesota, undertaken by a Food and Drug Inspector at the request of the Washington, D. C. office of the Food and Drug Administration.[71] The telegram of instructions dated November 18, 1948, ordered that "an investigation be undertaken . . . to determine scope and character of representations made orally, and by accompanying literature." The findings of fact of the Inspector on his investigation conducted pursuant to these instructions stated, in part, as follows:

> "All people I talked to including Mr. Quale, the distributor, were very friendly and cooperative. None of them thought that Nutrilite was a cure for anything but merely vitamins and minerals which would build their bodies up. None of these people were the rabid health addicts that one so often comes into contact with in an investigation of this type" (R. 930, 40).

[71] The telegram requesting this investigation and the results of it are found in Appellee's Exhibit Number 4 (R. 929-939, 39). See also Finding of Fact 31 by the District Court (R. 766).

Attached to the Food and Drug Inspector's findings are certain memoranda of interviews with users of Nutrilite (R. 931-937). These indicate that none of those interviewed believed Nutrilite to be a cure. Appellants' whole case is based on their contention that purchasers and users under customary conditions or purchase and use would believe just the opposite. The survey thus destroys their whole case. See *supra*, pages 27-30.

The record shows that in about 10 minutes after the trial started Appellee practically dissipated the Appellants' entire case by offering in evidence this survey from Appellants' own files which refutes every contention made by Appellants. Is it any wonder the trial court was shocked to find that Appellants proceeded *against* the information in their own files.

Despite this survey and its findings which concluded, in effect, that no broad representations were being made (see *supra*, p. 54), a seizure was affected in that very locality shortly thereafter, although no other investigation was conducted (R. 937-939). As far as the record in the case discloses, and as far as Appellee has been able to discover, this report and the Nebraska survey of similar import (R. 15) are the only Findings of Fact in the possession of Appellants which tended to show consumer reaction to the labeling in question.[71a] It is obvious, however, that this finding was ignored by the administrative officials who made the determinations of probable cause. In view of the fact discussed in the preceding section, that Appellants had no facts showing injury or damage to purchasers or consumers or any forms of complaints before them when the determinations were made, it was certainly incumbent upon them to call for and consider what little the Food and Drug Administration files contained concerning consumer

[71a] The results of the Nebraska survey, also secured from Appellants' files, being merely cumulative in character, was not offered in evidence herein.

reaction to the Appellee's labeling, as consumer reaction was the very question before them. Each decision maker so stated (see *supra*, page 27). If in fact those files were considered, it is inexplicable how and why the Appellants reached the conclusions they did.

The drastic nature of the power sought to be exercised by Appellants would appear to command that the natural and available avenues of information be explored.[72] Yet all that Appellants based their actions upon in this case was either a hasty scanning of part of the labeling in question or no scanning at all, and the vague and ambiguous statements attributed to ar unqualified psychiatrist which have been casually labeled by someone for Appellants as "Findings of Fact." It is only reasonable to believe that Appellants knew of the survey of purchaser impressions and it was certainly arbitrary and capricious to condemn the labeling without considering it and without questioning the so-called findings of Butz. In fact all of those making decisions testified they did *not* even talk to Butz.[73]

The administrative determinations herein were certainly not of the character which should receive proper deference from courts. To hold that the manner in which Appellants exercised this power was not subject to the "inexorable safeguards" of due process would be to place in the hands of the executive branch of the government a power which the framers of our Bill of Rights justifiably feared and guarded against.

As will be noted *infra*, pages 76-78, "probable cause" is no more than nor less than "reasonable cause." The cases would appear to establish that "reasonable or probable cause" does not exist where a party ignores or fails to take advantage of "reasonable" sources of information which

---

[72] See page 80 where authorities are cited on lack of probable cause under such circumstances.

[73] Finding 18(a) R. 761, R. 327-328, 385, 505.

might reveal facts which would have deterred the action taken. This is especially true where information naturally within the knowledge of a subordinate or employee is not inquired into. See *infra*, pages 80-81. Surely, Appellants Crawford, Larrick and Dunbar and Kingsley should have inquired as to what the official files contained concerning the labeling in question. There was no exigency which might have authorized the by-passing of deliberate and considered judgment and as "reasonable men" the Appellants should have made some further inquiry.

(e) Appellants Acted Arbitrarily and Capriciously in Placing Any Reliance Upon the So-Called Findings Attributed to a Psychiatrist Unqualified to Make Such Findings

All of the Appellants as well as J. D. Kingsley who made determinations of probable cause claimed in their testimony that they relied upon certain papers labelled Findings of Fact, and allegedly made by Dr. Robert C. Butz, a psychiatrist employed by the Food and Drug Administration.[74] These so-called findings were ostensibly accepted by Appellants and Kingsley without any consultation with Butz, or any attempt to verify or corroborate the conclusions reached by Butz or to connect the things named by the papers attributed to Butz with the pamphlets (Fdg. 18(a), R. 761). Appellant's statement that Crawford "re-examined the booklet to determine whether the booklet represented Nutrilite as an effective treatment for those symptoms and conditions" (Brief pp. 9-10) i. e., those named in the finding attributed to Butz, is entirely in error as reference to the record citations given by them clearly shows. Later herein, *infra* pages 72-74, Appellee points out this fact on non-connection between those alleged findings and the pamphlets in more detail. Furthermore, Appellant Dun-

[74] Finding 18(a) R. 761, R. 333-334 (Crawford); R. 395 (Larrick); R. 315 (Dunbar); R. 505 (Kingsley).

bar admitted that he accepted the findings of Butz, although he (Dunbar) was fully cognizant that Butz was a recent graduate from medical school and his experience was primarily limited to the field of psychiatry (R. 328). The others knew this or could have ascertained it if they had exercised reasonable prudence.

Ordinarily it might be assumed that the findings of a medical man should be accorded considerable deference. Not so in the instant case, however, for it was obvious not only from the deposition of Butz, but also from the testimony of Appellant Dunbar, that the field of nutrition was alien and foreign to Butz, and that his findings have little or no real relation to the pamphlets here involved. Also, Appellants' admissions directly contradict many of these so-called findings. Furthermore, Butz's deposition is replete with statements by him which contradict or so qualify the findings attributed to him that they are rendered worthless thereby [75] and he had obviously studied up on the subject just before the deposition was taken. In fact it was fairly obvious that he probably did not make the findings himself and this was probably one reason Appellants did not call him as a witness. It is also significant to note that Appellants' star medical witness in the trial below testified *that informed medical opinion could not say yes or no to the question as to whether the findings attributed to Butz correctly stated the present-day consensus of informed medical opinion.*[76] To say the least, this undermined Appellants' entire case as each finding attributed to Butz begins with the statement: "It is the concensus of informed medical opinion . . ." (R. 1171, 1173, 1217, 1533, 1534, 1540).

[75] Deposition of Dr. Butz admitted as Appellants' Exhibit 14, R. 1175-1216, 392. It is obvious that Appellants thought the deposition favored Appellee and was unfavorable to Appellants by demonstrating how unqualified Butz is because their Counsel stated (R. 393): ". . . we assumed that plaintiff would offer it in evidence and we weren't going to object to it."

[76] Testimony of Dr. Blankenhorn, R. 438.

Although Appellants sought to justify their actions on the basis of the findings attributed to Butz, and in a real sense attempted to make him the scapegoat for their arbitrary action, no effort was made by Appellants to call Butz as a witness or attempt to explain why he could not be called.[77] The importance of calling Butz or explaining his absence was noted time and time again by the Court below with indications that failure to call him to testify on his qualifications and the findings attributed to him would warrant an inference against Appellants on these facts (314, 333, 391).[77a] Yet counsel for Appellants stated that no attempt would be made to call him (391-393, 762). Appellee made lack of qualifications of Butz one of its major points in its case and Appellants knew of this long before the trial and heard of it constantly throughout the trial. In view of the importance attached by Appellants to the findings of Butz, the Court below properly found that Appellants' failure to call him or explain his absence gave rise to an inference that if Butz had testified his testimony would have been adverse to Appellants (Finding 18(e), R. 762). Here, indeed, silence became evidence of the most convincing character and the inference was rightly drawn by the trial court. See *Interstate Circuit* v. *United States*,

---

[77] The address given by Butz in the deposition taken for discovery purposes by Appellee is 9107 Eton Road, Silver Spring, Maryland, which the Court can judicially notice is adjacent to Washington (R. 1175).

[77a] The Court stated at R. 393: "The Court is going to admit this deposition, but the Court feels that it should warn the Defendants that their failure to produce the witness Butz or to give any explanation for failing to produce him, will be very seriously against the defendants' case.

"He is the key witness in this trial and it seems as though the defendants are not producing the witness because they don't want to produce him.

"Mr. Kleinfeld stated, himself, in open court that he hadn't made any effort to procure the attendance of the witness Butz, although every line of investigation in this case goes back to Dr. Butz."

306 U. S. 208, 225, 226; *Clifton* v. *United States*, 4 How. 242, 247.

Section 304(a) of the Food, Drug and Cosmetic Act, in authorizing determinations of probable cause to be based upon facts found by any officer or employee of the agency, presupposes that the officer or employee finding such facts is qualified to make the finding. To use an extreme example, it cannot be imagined that Appellants could hide behind a finding made by an uneducated janitor—but is not their reliance on Butz almost as bad? To base a determination upon facts found by an unqualified employee, particularly in view of the severe consequences flowing from such a decision, would be to act in violation of due process of law. Appellants' reliance upon the so-called findings of an unqualified employee of the Food and Drug Administration is relevant evidence reflecting the arbitrary and capricious nature of their determinations herein.

(f) The Determinations Were Made Secretly Without Giving Appellee the Opportunity It Requested to Eliminate Objections

Conceding, *arguendo*, that Appellants had the right, under Section 304(a) of the Food, Drug and Cosmetic Act, to make the determinations in question without affording to Appellee the opportunity to be heard, that should not mean that Appellee was to be denied all the rudiments of fair play by being kept in ignorance of the determinations which had been rendered against it. Appellants, however, never disclosed to Appellee that the determinations questioning its pamphlets had been made until it became necessary for Appellants to file the same in this action (R. 274). The very nature of the determinations would seem to require that Appellee should have been given some notice of the impending "crackdown," especially since it had repeatedly asked for an opportunity to comply with all objections (Fdg. 13, 20, R. 760, 763). From this secrecy it can be im-

plied that Appellants knew there was something wrong with their determinations and wanted to hide them to prevent its discovery. Secrecy is particularly abhorrent to justice under law. *Re Oliver*, 333 U. S. 257, 264; *Kwock Jan Fat* v. *White*, 253 U. S. 454, 464.

Secrecy provides a cloak for the misinformed and for the use of arbitrary fiat bent on oppressive injury. Here when the veil of secrecy was taken away, there was a shocking disclosure of condemnation without reading, without knowing what was read, of condemning when all the facts in their files were to the contrary, and all the other facts disclosed in the Findings of Fact herein. In *Bratton* v. *Chandler*, 260 U. S. 110, 114 this Court gave a statute a construction which would avoid "secrecy, prejudice and intrigue" by reading in a hearing requirement and saying any other intent should not be attributed to the legislature.

In July, 1948, Appellee had requested Appellants to advise it if ever any questions about any of Appellee's labeling arose so the labeling could be corrected at once, (Fdg. 13, R. 760). Yet no such advice was given before the decisions herein and in fact Appellants take the position that they will not even talk to Appellee about its labeling until all litigation is over, so all Appellee can do is fight or die (R. 419, 421, 534, Fdg. 15, R. 760, Fdg. 20-21, R. 763).

It should be noted again that Appellee, immediately after the first seizure, ordered the pages objected to removed from its labeling and informed the Food and Drug Administration that the seizure was the "first intimation . . . received . . . that any of the literature was objectionable" and that in the future a letter from "the Agency pointing out . . . objections would bring about a correction without the necessity of court action" (R. 763, Appellee's Exhibit 13, R. 1026, 64-65, 63). Appellants ignored this show of willingness to comply and thereafter made ten other seizures and five determinations of probable cause without notice to Appellee (R. 763-766). Appellant Larrick, who condemned

the 36 page booklet, even testified that he was cognizant at the time of his determination of the fact that the determination prior to his had only condemned the last twenty pages of the pamphlet, that these pages had been promptly removed and that Appellee's attorneys had requested an opportunity to comply with future objections (R. 414, 765). In spite of these facts, Appellant Larrick kept hidden from Appellee that he had authorized multiple seizures on the thirty-six pages which Appellant Crawford did not attack or find fault with in any way (R. 274, 765).

(g) The Conclusion of the Court Was the Only One It Could Reach Under the Facts of This Case and the Decisions of This Court

Without a detailed discussion of the other acts of arbitrary, capricious, oppressive and unlawful conduct of Appellants as set forth in the 22 major acts complained of *supra* pages 13-18, and the Findings of Fact herein, it is submitted that the conclusion reached by the Court below was not "clearly erroneous" but was the only conclusion on this record which would be consonant with those principles of statutory construction and due process as interpreted by the decisions of this Court.

Due process of law in administrative action requires not only that there be substantial evidence to support the decision but also commands that the decision be fairly reached. These requirements of substantive due process and procedural due process are separate and distinct and if either is wanting the decisions in question can justly be said to be "palpably wrong and therefore arbitrary." See *Leach* v. *Carlile*, 258 U. S. 138, 140.

Were the determinations in question fairly reached? Could it be said that a mere scanning of the labeling in question in view of the damaging effect of the determinations on Appellee's entire business was consonant with

those principles of fair consideration? The answer is found in *Kassin* v. *Mulligin, supra,* where the Court stated (p. 402) that "arbitrary or capricious appraisal of evidence is in legal effect failure to consider." Could it be said that Kingsley's three determinations based on three different booklets when he read only one, and that one is unidentified, reflected that spirit of fair consideration which due process demands?

What of the investigation conducted by the Food and Drug Administration to determine the impression of Appellee's pamphlets arrived at by purchasers and consumers who read the pamphlets and bought the product? The Food and Drug Administration certainly felt that a report of consumers' reaction was important for the telegram of instructions specifically stated that possible seizures rested on the outcome of the investigation (R. 929).

A similar situation to the instant case and this survey was presented in the decision of this Court in *Kwock Jan Fat* v. *White, supra,* where relevant, although not controlling, evidence was excluded from the record of an immigration proceeding and such evidence was not before either the Commissioner of Immigration or the Secretary of Labor when they each decided the case. This Court held that the suppression or omission of such evidence from the report amounted to a denial of due process. It was stated at page 464:

> "The acts of Congress give great power to the Secretary of Labor over Chinese immigrants and persons of Chinese descent. It is a power to be administered not arbitrarily and secretly, but fairly and openly, under the restraints of the tradition and principles of free government applicable where the fundamental rights of men are involved, regardless of their origin or race. It is the province of the courts . . . to prevent abuse of this extraordinary power, and this is possible only when a full record is preserved of the essentials on which the executive officers proceed to judgment."

The decision of this Court in *Lloyd Sabaudo Societa Anonima* v. *Elting*, 287 U. S. 329, is also relevant to the present inquiry. In that case, the Secretary of Labor imposed fines against petitioner for bringing to the United States, in violation of the immigration laws, persons afflicted with certain diseases which might have been detected by competent medical examination at the time of foreign embarkation. In the case of one of the aliens brought in by the petitioner, evidence was submitted showing that the alien had been subjected to medical examinations prior to foreign embarkation and had been found in good health. The Secretary imposed a fine, however, on the basis of the certified medical opinions of physicians who examined the alien on arrival in the United States, the opinions reciting that the disease discovered "might have been detected by competent medical examination at the port of embarkation." It did not appear from the record whether the Secretary considered the examination conducted just prior to embarkation or whether the medical officers who examined the alien in the United States had been apprised of the foreign examination. The Court, speaking through Mr. Justice *Stone*, held that the Secretary of Labor acted arbitrarily and capriciously. It was stated at page 338 and 339:

> "The letter imposing the fine in the Fusco Case does not show definitely whether the Secretary considered the evidence submitted by petitioner. It recites in one place, 'The alien gave no history of the disease. Indeed, he was not questioned with regard thereto, and the only evidence in the record is the official certificate itself.' And in another, 'It is believed that the evidence placed in the record by the company is not sufficient to call into question the accuracy of the opinion expressed in the official medical certificate.' We need not inquire whether this ambiguity in the record of itself requires the administrative determination to be set aside. *Cf. Tod* v. *Waldman*, 266 U. S. 113, 119, 120, 69 L. ed. 195, 199, 45 S. Ct. 85; *Mahler* v. *Eby*, 264 U. S. 32, 43, 68 L. ed. 549, 556, 44 S. Ct. 283; *Kwock Jan Fat*

v. *White*, *supra*, 253 U. S. 454, 64 L. ed. 1014, 40 S. Ct. 566. For the same result must follow if the record is considered, whichever way the doubt is resolved. If the Secretary failed to consider evidence before him, he exceeded his authority. If he treated the protest and affidavits as evidence relevant to the discoverability of the immigrant's disease at the time of sailing, but, nevertheless, chose to rely upon the certified opinion of the examining physicians at Ellis Island, we think that more is involved than the weighing of the evidence, and that his determination cannot stand. For the medical opinions did not reveal the facts upon which they were based, and they were formulated by physicians who, so far as appears, were not apprised of the fact that three previous examinations of the nature described had been made. The detailed information as to those examinations which petitioner submitted to the Secretary in this case might reasonably have affected the expert judgment of the physicians at Ellis Island. In relying upon their opinion alone, without putting these additional facts before them, we think the Secretary acted arbitrarily and unfairly.

"The Act of Congress confers on the Secretary great power, but it is not wholly uncontrolled. It is a power which must be exercised fairly, to the end that he may consider all evidence relevant to the determination which he is required to make, that he may arrive justly at his conclusion, and preserve such record of his action that it may be known that he has performed the duty which the law commands. Suppression of evidence or its concealment from a party whose rights are being determined by the administrative tribunal, has been held to be so unfair as to invalidate the administrative proceeding. *Kwock Jan Fat* v. *White*, *supra*; *Lewis ex rel. Lai Thacy Lem* v. *Johnson*, (CCA 1st) 16 F. (2d) 180. It is equally offensive to conceal from the experts, whose judgment is accepted as controlling, facts which might properly have influenced their opinion."

Previously, the opinion pointed out the scope and extent of judicial review of the action of the Secretary. It was said at pages 335 and 336:

"The action of the Secretary is, nevertheless, subject to some judicial review, as the courts below held. The courts may determine whether his action is within his statutory authority . . . whether there was any evidence before him to support his determination . . . and whether the procedure which he adopted in making it satisfies elementary standards of fairness and reasonableness, essential to the due administration of the summary proceeding which Congress has authorized."

In making the decisions in question, without reading the labeling in its entirety, by accepting the findings of the psychiatrist without question, in ignoring the fact that no facts showing injury or damage were presented to them, by ignoring the absence of consumer complaints in ignoring their own files which showed a negative result in an investigation of consumer reaction, in failing to give notice to Appellee who had expressed an honest desire to conform to the views of the administration, can it be said, in the language of the *Lloyd* case, *supra*, that the determinations satisfied "elementary standards of fairness and reasonableness, essential to the due administration of the summary proceeding which Congress has authorized"? The conclusion that the Appellants acted arbitrarily, capriciously and oppressively in making their determinations is inevitable and could not be otherwise.

11. Appellants Violated the Statutory Provisions Here Involved in Making Their Decisions Authorizing Multiple Seizures

(a) Appellants Have Statutory Power to Make Only One Seizure "Except" in 4 Specified Cases of Misbranding—They Can Make Unlimited Seizures of Products Charged to Be Adulterated

Section 304(a)[18] provides that Appellants have the power to make unlimited seizures in cases of adulteration,

[18] *Supra* footnote 1.

but "not more than one" seizure "based upon the same alleged misbranding"—"except" in 4 exceptional and specified instances. These are: (1) When the United States has won a judgment condemning the particular misbranding and when the Administrator has probable cause to believe from facts found, without hearing, that (2) the "misbranded article is dangerous to health," (3) the labeling is "fraudulent" or, (4) the labeling is or would be in a material respect misleading to the injury or damage of the purchaser or consumer. Here Appellants must show they were within one of the 4 exceptions as no charge of adulteration is made. The first three exceptions are admittedly inapplicable (R. 759-760). To satisfy the burden of getting within the 4th exception, the Appellants were required to make decisions based upon "facts found" that Appellee's labeling is or would be "in a material respect" misleading to the "injury or damage" of the purchaser or consumer, and Appellants say they made the six *ex parte* decisions already well identified herein. It is Appellants' actions in making these decisions directly *contra* to all the facts in their files and in the manner found in the Findings of Fact of which Appellee complains.

The statute here gives Appellee a *right* to be free of multiple seizures and says Appellants can acquire power superior to that "right" *only* by making a specified decision. Without the decision under the statute as applied to the facts herein, Appellee's right to be free of multiple seizures remains absolute. The Appellants have no "rights"—only carefully circumscribed "duties" and "powers" under this Statute.

(b) What Appellants Have Done Does Not Comply with the Statute

To say that what Appellants have done as set forth in the Findings of Fact herein (R. 756-770) complies with Section 304(a) does violence to all reasonable construction

of the provisions therein contained. Subsections (c) through (e) of this section discuss "probable cause." The next subsection (f) discusses Appellants' "use of multiple seizures as a punishment" as "a violation of the statute and the due process clause." This subsection considers other aspects of the statutory violation.

To impute an intention to the Congress that citizens would be treated in the arbitrary, capricious and oppressive manner herein revealed by Appellants' actions does not comport with logic. Is it any wonder that Appellants do not attempt to defend their conduct on the merits but resort to a claim that their actions are free from examination by any court. Congress certainly intended that all persons be treated fairly under the words of Section 304(a) here involved and by no stretch of the imagination can it be said, on the facts in this case, that Appellee has received that fundamental fairness which due process of law has always required.

The only provision of Section 304(a) involved in this case is the provision prohibiting multiple seizures except:

> "when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency . . . that the labeling of the misbranded article is . . . or would be in a material respect misleading to the injury or damage of the purchaser or consumer."

Under the provision just quoted it is to be noted that the words "without hearing" *can* be applied *only* to "facts found" and that in any event the Administrator is *not* prohibited from granting a hearing. We believe that the fundamental fairness required by the due process clause of the Fifth Amendment should be read into this provision so as to require a hearing under the language of the Act where facts such as in the instant case exists. Since the Administrator is not *required* by the statute to make his probable cause decision, without hearing, the statute should

be read so as to avoid all constitutional questions and require that Appellee be granted an opportunity appropriate to the nature of the matter under consideration to present its facts to him before he makes decisions authorizing the use of multiple seizures under facts like those in the instant case. To have given Appellee an opportunity to present its side of the matter to him would have caused little delay, slight expense, no prejudice to the public interest, and at the same time would have protected against the kind of arbitrary action here proved. The opportunity need not have been a regular judicial hearing. *The Japanese Immigrant Case*, 189 U. S. 86, 100. In *American Power & Light Co.* v. *Securities & Exchange Comm.*, 329 U. S. 90, 108, the Court said:

> "Here, in the absence of definite contrary indications, it is fair to assume that Congress desired that 11(b)(2) be lawfully executed by giving appropriate notice and opportunity for hearing to all those constitutionally entitled thereto . . .
>
> "But should the Commission neglect to follow the necessary procedure in a particular case, such failure would at most justify an objection to the administrative determination rather than to the statute itself. It would then be needless to do more than nullify the action taken in disregard of the constitutional rights to notice and opportunity for hearing."[79]

Coming then to the facts in the instant case other than the probable cause phases discussed *infra* pages 72-81, it is believed that Appellants exceeded the authority vested in them by statute by their arbitrary, capricious, and oppressive actions set forth in the Findings of Fact herein. Since

---

[79] A hearing requirement was read in to save a Tennessee statute regulating real estate brokers in *Bratton* v. *Chandler*, 260 U. S. 110, 114, to avoid violation of due process by "secrecy, prejudice and intrigue." The same was done for a Georgia statute in *Toombs* v. *Citizens Bank*, 281 U. S. 643.

such actions have been fully discussed *supra* pages 46-66, they are not repeated here.

> ". . . to allow an administrative officer to destroy a profitable business on the ground of an alleged unlawfulness which is disputed, without allowing the owner a chance to know the charges and to meet them with evidence and argument, involves unfairness apparent to any eyes not blinded by dazzling conceptualism. To find that alert judges would permit such injustice would be amazing."[80]

On this record we find Appellants ignoring the absence of facts and complaints and ignoring the only facts they had in their files (those favorable to Appellee) and holding that Appellee's labeling was "in a material respect" of such a character as to be "misleading" to the injury or damage of the purchaser or consumer (R. 1171-1172, 1174, 1216-1218, 1532-1541). How it could be "in a material respect" misleading when all the facts were just to the contrary, and how it could be misleading to the "injury" or "damage" of the purchaser or consumer when they had no facts and no complaints and why they have no "facts" after all of their searching investigations raises but one possible inference. The absence of facts speaks louder than words in Appellee's favor. Appellants called not one single consumer or purchaser as a witness at the trial, yet they admittedly conducted a most exhaustive investigation of Appellee, its product, its distributors and its purchasers.

If the Appellants had developed any facts whatever in connection with the indictment in California, the injunction action in California, the ten libel actions throughout the United States, or in the course of their nation-wide investigation of Appellee's customers and distributors, they certainly would have offered such facts to show that

---

[80] Davis, *The Requirement of Opportunity to be Heard in the Administrative Process* (1942), 51 Yale L. Rev. 1093, 1120.

their decisions had some reasonable basis in fact and their failure to do so can leave only one conclusion and that is they had no facts and have no facts.

Appellants knew that they would be called upon to justify their actions herein from December 30, 1948 on up to October 17, 1949, when the trial started. During that time Appellee had taken the deposition of every major employee or officer of the Food and Drug Administration and the Federal Security Agency who had anything to do with Nutrilite or its labeling. During that time Appellee filed numerous interrogatories and Appellants were forced to answer these interrogatories after their objections were overruled by the Court. During that time Appellee had called upon Appellants to make many admissions under Rule 36 of the Federal Rules of Civil Procedure, and again, after the Court had overruled their objections, the Appellants were forced to answer. Yet under all of these circumstances they came up to the trial in October, 1949, with a defense still lacking in any facts on injury or damage—they still lack any complaints—and all the credible evidence was against them. Appellee has thousands of customers (it must have to do the large volume of business it does) and Nutrilite has been sold for 16 years; yet, under the most punishing of investigations no facts showing complaints against Appellants were found—a most remarkable record for any business of this size. Further, if Appellants had any way to strengthen their decisions of probable cause they certainly would have written such facts into the Kingsley decisions made after this litigation began and, in fact, as a result of this litigation. Instead of stronger decisions he signed decisions identical in every word with those of Crawford, Larrick and Dunbar.

Could Congress be said to have contemplated that Appellant Crawford could condemn the 58 page pamphlet without reading the first 36 pages (R. 334-335, 383-385). Could Congress be said to have contemplated that Larrick, Dun-

bar and Kingsley would condemn the pamphlet with the purchaser survey finding in their files that such action was 100% wrong and have considered that any of them could have had "probable cause" that the pamphlet was misleading in "a material respect" to the injury or damage of the purchaser or consumer?

We also have the fact that when Appellants questioned pages 37-58 of the 58 page pamphlet they were immediately deleted and Appellee requested an opportunity to comply with any other objections ~~and avoid multiple seizures~~ (R. 59-65). Can Congress be said to have contemplated that Appellants would arrogantly refuse to tell Appellee what they thought was wrong with the remainder of the pamphlet and then two months later authorize further seizures by condemning these first 36 pages?

(c) J. D. Kingsley's Determinations of Probable Cause Are Void on Their Face

Section 304(a) of the Federal Food, Drug and Cosmetic Act allows multiple seizures of a product,

> ". . . when the Administrator has probable cause to believe from facts found, without hearing, by him or any officer or employee of the Agency, that the misbranded article is . . . or would be in a material respect misleading to the injury or damage of the purchaser or consumer."

And as a result of Judge Pine's ruling that it is the Administrator who must make these determinations of "probable cause," J. D. Kingsley made three on January 28, 1949 (Dfs. Ex. 23, R. 1532-1541, 518). Each determination made by Kingsley (and those of Appellants Crawford, Larrick and Dunbar), was exactly the same and read in part,

> ". . . I conclude on the basis of the facts reported above by Dr. Robert C. Butz, an employee of the Food and Drug Administration . . . that there is probable cause for me to believe and I do believe, that the label-

ing would be and is in a material respect misleading to the injury or damage of the purchaser or consumer" (R. 1534, 1535, 1541).

The sole facts relied upon were the three so-called findings of fact allegedly made by Butz (R. 505). All three of these findings begin by stating, "It is the consensus of informed medical opinion that a product consisting of" (R. 1533, 1534, 1540) then follows a listing of various vitamins and minerals "would not be effective in the treatment of"; the first so-called finding names certain symptoms, conditions and diseases (R. 1533-1534); the second refers to "conditions mentioned directly or by implication in the statements quoted in Exhibit 'A' attached" (R. 1535). (Exhibit "A" contains excerpts allegedly picked from some unknown version of Appellee's pamphlet, R. 1535-1540); and the third refers only to "most common diseases" (R. 1541). These so-called facts were not connected or identified in any way with Appellee's pamphlet, nor were they associated in any manner with injury or damage to purchasers and consumers, yet from them *alone* J. D. Kingsley and Crawford, Dunbar and Larrick concluded they had "probable cause."

Since these determinations are a condition precedent to the institution of the "harsh" remedy of multiple seizures, they should state definitely and specifically adequate facts showing the basis of the determinations of "probable cause." These determinations on their face are indefinite and uncertain and are not related in any way to the pamphlets. They do not show clearly that either Butz or Kingsley read the pamphlets and, most important, there is no connection of any sort between the alleged finding of fact and the conclusion that the "labeling *would be and is in a material respect* misleading *to the injury or damage* of the purchaser or consumer."

Kingsley's three determination gave authority to go forward with new seizures and mimeographed papers were

prepared to enable seizures to be made quickly (Finding 32(c), R. 767). Also Appellants may contend these decisions put life into eleven seizures which have caused Appellee irreparable injury, and yet as the Court said in *Ohio Bell Telephone Co. v. Public Utilities Commission*, 301 U. S. 292, 302.

> "From the standpoint of due process—the protection of the individual against arbitrary action—*a deeper vice is this, that even now we do not know the particular or evidential facts of which the commission took . . . notice and on which it rested its conclusion. Not only are these facts unknown; there is no way to find them out.*" (Italics supplied.)

The same analysis applies to the determinations of Kingsley, Crawford, Larrick and Dunbar. On their face the decisions do not comply with Section 304(a) and are void.

(d) The Determinations Are Not Conclusive Evidence of Probable Cause

Appellants contend (46 *et seq.*) that the six determinations are conclusive evidence that the decision makers had "probable cause." They compare the determinations with an indictment returned by a grand jury and cite *Ex Parte United States*, 287 U. S. 241, as their authority. It is respectfully submitted that Appellants are in error. First of all there can be no comparison of action by a grand jury composed of from sixteen to twenty-three impartial private individuals with action by the Administrator of the Federal Security Agency acting to uphold previous action of his biased subordinates as shown in the Findings of Fact herein.[80a] A grand jury is not required to act on "facts found"

[80a] Appellants in fact destroy their own analogy by recognizing at p. 50 ". . . the grand jury proceeding is a guarantee against arbitrary action. . . ."

and the whole purpose and nature of grand jury action and action pursuant to this statute are very different. A grand jury authorizes only one action on the same facts and law, not a seizure in 5,000 different places and one indicted is entitled to a speedy trial. The statute here involved provides for a hearing (Section 305) before criminal proceedings are started. And finally, even an indictment is not in every instance considered conclusive evidence of probable cause. In *Ex Parte United States, supra,* the Court held that an indictment was conclusive as to the existence of probable cause *only* to the court to which it is returned, while Kingsley's determinations were not returnable to any court and could only have been questioned in the court below. Moreover, in cases involving the problem of removing a person from one jurisdiction to another in which he had been indicted, this Court has held that an indictment is not conclusive evidence of "probable cause," but only *prima facie* evidence which may be rebutted.[80b] As this Court said in *Price* v. *Henkel,* 216 U. S. 488, at page 491:

> "That at least a *prima facie* case for removal was made by the introduction of the indictments returned against him in the District of Columbia is not disputable. That much efficacy is attributed to a certified copy of an indictment found in a competent court of another district when put in evidence in a removal proceeding. *Bryant* v. *U. S.,* 167 U. S. 104; *Green* v. *Henkel,* 183 U. S. 249; *Hyde* v. *Shine,* 199 U. S. 62; *Beavers* v. *Henkel,* 194 U. S. 73. *But the evidence of probable cause afforded by the indictment is not conclusive.*" (Italics supplied.)

[80b] Rule 40 of the Federal Rules of Criminal Procedure does make an indictment conclusive evidence of probable cause in removal proceedings. The Advisory Committee in their notes to Rule 40 specifically recognizes that the rule is a modification of the previous procedure which developed as a result of the above decisions.

See also *Kassin* v. *Mulligan*, 295 U. S. 396, 401; *Haas* v. *Henkel*, 216 U. S. 462, 481. And in *Tinsley* v. *Treat*, 205 U. S. 20, 32, where the defendant offered evidence to rebut the indictment and the court refused to admit it, the Court said:

> ". . . the judge applied to to remove him from his domicil to a district in another state must find that there is probable cause for believing him to have committed the offense . . .
>
> "Appellant was entitled to the judgment of the district judge as to the existence of probable cause on the evidence that might have been adduced . . ."

Therefore, it cannot be argued that a determination of probable cause, having none of the safeguards of an indictment, such as not being under oath or being the determination by impartial individuals, which is not always considered conclusive evidence of probable cause, can properly be considered as conclusive evidence that J. D. Kingsley had "probable cause." *Ex parte* determinations in other instances are not conclusive (cf. *Lindsey* v. *Hawes*, 2 Black 554) and *ex parte* determinations under the facts herein certainly should not be.

(c) Kingsley Did Not Have Probable Cause Under the "Reasonable Man" Test

The term "probable cause" has been defined and expounded upon in many decisions of this Court involving different fields of law. However, these decisions have not treated the term differently in any particular field but rather have constantly relied on decisions in fields foreign to the one before the Court for their definitions. All of the decisions appear to establish that probable cause is no more or no less than "reasonable cause" and it exists where the facts and circumstances warrant a man of prudence and caution in believing that the particular offense or act has been committed.

One of the most recent definitions of probable cause is

found in the case of *Brinegar* v. *United States*, 338 U. S. 160, a case involving a search without a warrant. The Court there said (p. 175):

> "In dealing with probable cause . . . as the very name implies, we deal with probabilities. These are not technical; they are factual and practical considerations of every day life on which reasonable and prudent men, not legal technicians, act . . .
>
> " 'The substance of all the definitions' of probable cause 'is a reasonable ground for belief of guilt' . . . And this 'means less than evidence which would justify condemnation' or conviction, as Marshall, C. J., said for the Court more than a century ago in *Locke* v. *U. S.*, 7 Cranch, 339, 348. (A case dealing with seizures under the Collection Law.) Since Marshall's time . . . it has come to mean more than bare suspicion: Probable cause exists where 'the facts and circumstances within their (the officers') knowledge and of which they had reasonably trustworthy information sufficient in themselves to warrant a man of reasonable caution in the belief that' an offence has been or is being committed. *Carroll* v. *U. S.*, 267 U. S. 132, 162.) (A case involving search and seizure without a warrant.)[81]

As stated above, probable cause only exists where the facts and circumstances warrant a *reasonable and cautious man* in believing that the offense has been committed. This Court has stressed that good faith alone is not enough to constitute probable cause. In *Director General*

[81] To the same effect are cases involving: search warrants, *Nathanson* v. *United States*, 290 U. S. 41, 47; *Grau* v. *United States*, 287 U. S. 124, 128; *Dumbra* v. *United States*, 268 U. S. 435, 441; *Steele* v. *United States*, 267 U. S. 498, 504; false imprisonment, *Director General of Railroads* v. *Kastenbaum*, 263 U. S. 25, 27, 28; malicious prosecution, *Wheeler* v. *Nesbit*, 65 U. S. 544; malicious institution of proceedings, *Stewart* v. *Sonneborn*, 98 U. S. 187; and seizures, *Locke* v. *United States*, 7 Cranch 339, 348; *The Thompson* v. *United States*, 3 Wallace 155; *Wood* v. *United States*, 16 Pet. 342; *Stacey* v. *Emery*, 97 U. S. 642, 645.

of Railroads v. *Kastenbaum, supra,* the respondent brought an action for false imprisonment against the Director General, an official of the United States government. Certain quantities of butter, stolen from a railroad freight car, were found in a wagon which had collided with a trolley car, the drivers of the wagon escaping at the time of the collision. Railroad detectives, agents of the Director General, thought they had traced ownership of the horse which had been pulling the wagon to the respondent and he was immediately arrested. Respondent was finally released after "his horse proved to be one of another color." The trial court's judgment of $500.00 was affirmed by the Court which said at pages 27-28:

> "*The want of probable cause, certainly in the absence of proof of guilt or conviction of the plaintiff, is measured by the state of the defendant's knowledge,* not by his intent. It means that the absence of probable cause was known to the defendant when he instituted suit. But the standard applied to the defendant's consciousness is external to it. *The question is not whether he thought the facts constitute probable cause, but whether the court thinks they did.* Holmes on Common Law, 140. Probable cause is a mixed question of law and fact . . . Counsel for petitioners contend that, in an action against the sovereign government, it must be conclusively presumed that good faith existed on its part so far as it is responsible for the arrest, and therefore that a complete defense of probable cause on its part is always made out. *But as we have seen, good faith is not enough to constitute probable cause. That faith must be grounded on facts within the knowledge of the Director General's agent which in the judgment of the court would make his faith reasonable.*" (Italics supplied.)

Therefore, here it is of no importance if Kingsley and the others in good faith thought Appellee's pamphlet misleading. The question is rather whether the Court believes that he acted as a reasonable and prudent man and ground-

ed his determinations on facts and circumstances on which he had "reasonably trustworthy information" and the validity of his determination of probable cause must be measured by the state of his "knowledge, not his intent."

The facts before Kingsley which were not disclosed in his determinations were clearly brought out when his deposition was taken. Kingsley knew that he made three separate determinations because there were three pamphlets involved (R. 513), yet he admitted that he had only read one of the versions and he didn't know which one that was (R. 504-505).[82] Furthermore, even though he had concluded in each of his determinations that Appellee's labeling "would be and is in a material respect misleading to the injury or damage of the purchaser or consumer," when asked whether he had been presented with any facts showing that any purchaser or consumer had been injured or damaged or whether any purchaser or consumer had complained of injury from Appellee's product or its labeling he admitted he had not (R. 269, 507). Certainly the above shows that when the state of Kingsley's knowledge is measured, he had no facts or circumstances warranting a prudent and cautious man to believe that the labeling was misleading to the injury or damage of anyone.

Moreover, Appellee had twice requested an opportunity to present the true facts to Kingsley and each was refused (R. 732, 752). Certainly this, with the absence of any facts showing injury or damage and the failure to have any evidence of complaints was evidence which should have been considered by Kingsley as being in Appellee's favor. The only possible conclusion is that all of this was ignored and this Court has held that a failure to consider evidence in favor of the accused is a denial of due process. *Kwock Jan Fat* v. *White, supra; Lloyd Sabaudo Societa Anonima* v.

[82] Kingsley testified "I am uncertain as to what version I read . . . Whether it was this version or some other version I am not entirely certain." (R. 505. See also R. 513.)

Elting, supra; Kaskin v. *Mulligan, supra; Tinsley* v. *Treat, supra.*

Also Kingsley either ignored the favorable evidence to Appellee disclosed in the investigation conducted of purchasers at Appellants' request (Pl. Ex. 4, R. 929-937, 38-39) or made no attempt to determine its existence. Besides being a denial of due process under the cases cited above, there is considerable authority in state decisions to the effect that want of probable cause may be shown *by the failure to make inquiry or to seek readily obtainable information which would have established the true facts. Baker* v. *Gawthorne,* 82 Cal. App. (2d) 496, 186 Pac. (2d) 981 (1947); *Lawrence et al.* v. *Leathers,* 31 Ind. App. 414, 68 N. E. 179 (1903); *Boyd* v. *Mendenhall,* 53 Minn. 274, 55 N. W. 45 (1893); and the *Kastenbaum* decision *supra,* applied the same reasoning in this Court.

Under the holding of the *Brinegar* case *supra,* probable cause only exists when the facts or circumstances are based on "reasonably trustworthy information." Here the sole information on which Kingsley based his determinations of probable cause was the so-called findings of fact attributed to a psychiatrist Dr. Butz. It is true that the act permits findings of fact to be made by an employee but it is submitted that there must be read into that provision a requirement that the employee be a qualified one. Here the findings were not under oath, Kingsley had never discussed them with Butz (R. 761) and it is respectfully submitted that the Trial Court properly found that Kingsley could not reasonably place any reliance on Butz (R. 762). He was not a biochemist or nutritionist (R. 1185), he did not check his findings by reading scientific literature in the field (R. 1177), he did not conduct any experiments with nor analyze the product (R. 1199), and when his deposition was taken he very definitely repudiated many of the statements in the findings attributed to him (R. 762). Informa-

tion from such a source when the very existence of a large business is at stake cannot by any reach of the imagination be termed "trustworthy."

The Court in the *Brinegar* case, *supra*, in discussing the reasoning behind these standards set down for determining the existence of probable cause said:

> *"These long-prevailing standards seek to safeguard citizens from rash and unreasonable interferences with privacy and from unfounded charges of crime.* They also seek to give fair leeway for enforcing the law in the community's protection. Because many situations which confront officers in the course of executing their duties are more or less ambiguous, room must be allowed for some mistakes on their part. *But the mistakes must be those of reasonable men, acting on facts leading sensibly to their conclusion of probability.* The rule of probable cause is a practical, nontechnical conception affording the best compromise that has been found for accommodating those often opposing interests. Requiring more would unduly hamper law enforcement. *To allow less would be to leave the law-abiding citizen at the mercy of the officer's whim or caprice."* (Italics supplied.)

To say that J. D. Kingsley and Appellants Crawford, Larrick and Dunbar had probable cause under the facts of this case clearly "would be to leave the law-abiding citizen at the mercy of the officer's whim or caprice."

(f) Appellants Authorized Use of Multiple Seizures and Embargoes as a Punishment Rather Than a Public Protection in Violation of Statute and Due Process Clause

The multiple seizure provisions of Section 304(a) are clearly designed as a protection of the public by providing for the taking of adulterated or misbranded products off the market entirely. The power conferred is tremendous

in its consequence and the legislative history of the Act[83] indicated that Congress was fully aware of this fact so it circumscribed the use of the power most carefully.[84] Appellants have, in violation of the statute and the due process clause, used multiple seizures and embargoes herein to inflict punishment upon Appellee rather than as a public protection.

This Court has said of the Food, Drug and Cosmetic Act that ". . . . the Act as a whole was designed primarily to protect consumers from dangerous products." *United States* v. *Sullivan*, 332 U. S. 689, 696 citing *United States* v. *Dotterweich*, 320 U. S. 277, 282. It is in the light of this objective that the powers conferred by the words here involved on multiple seizures based on misleading labeling must be construed. *Ex parte Endo*, 323 U. S. 283, 300; *United States* v. *Lovett*, 328 U. S. 303, 307.

As already stated, the public protection provided by multiple seizures is found in taking the product entirely off the market. Here this was not Appellants' purpose. Their purpose was admittedly to use multiple seizures "to keep a sustained pressure against" Appellee (Pl. Ex. 16, R. 1030a, 67).

Looking at these multiple seizure provisions and the actions of Appellants herein it is seen that Appellants have really made no effort (other than the last-minute filing of an injunction action in Los Angeles one year after the first libel seizure was filed[84a]) to take or keep Appellee's product off the market. Appellants admit that the product is harmless and that it contains vitamins and minerals which are

---

[83] See Cavers, The Food, Drug and Cosmetic Act of 1938 Its Legislative History and its Substantive Provisions (1939) 6 Law. & Contemp. Prob. 2, 13.

[84] See Senator Bailey, 79 Cong. Rec. 5217, ". . . once there has been a multiple seizure throughout America, all the Court trials in the world would not remedy the wrong. The man would be disgraced; his wares would be discredited."

[84a] See note 35 *supra* 17 and note 85a *infra* page 84.

beneficial as a supplement to the diet of human beings (R. 330, 373-374, 749, 757, 759, 1214-1215). Appellants knowing their own files refute the charges they make in the libel cases (R. 39-47), concocted a scheme of seizing this product in a far-flung geographical pattern to "punish" Appellee as much as possible before the certain rejection of their charges in Court. Such a deliberately designed pattern will inflict the maximum punishment upon Appellee—a punishment which Appellants know is and will be irreparable and irremediable—while at the same time affording no protection whatever to the public. This lack of public protection it is earnestly contended by Appellee, is by inference an admission that the purpose of the Appellants in making the seizures is "punishment" rather than protection. The Trial Court so found.[85]

As Appellants well know, when a seizure is made of a particular shipment of a product that does not prevent a distributor from selling other shipments of the product which he has on hand. When a seizure is made in Belleville, New Jersey, the distributor can sell other shipments of the product he has on hand to any purchaser who will buy and who has not been intimidated by the stigma of the Government seizure action or scared by the publicity released by Appellants which accompanied these seizures (Fdg. 39, R. 769).

If the first ten seizure actions are consolidated and the Appellants carry out their threats to institute additional seizures, Appellee would soon have a large number of "consolidated" cases all over the United States combining two or more of said seizure actions, and there is no provision in the statute for consolidating the consolidated actions. Also, Appellants have tried every possible delaying technicality so far herein so they would be sure to raise this point. The Appellants defeat their own contentions when they say that

---

[85] Finding 22, R. 763-764.

the pending libels can be consolidated into one action, for it is obvious that *if they are to be in one action eventually, no reason on earth exists for the institution of ten libels other than "punishment" of Appellee* for failing to guess what Appellants want them to say in its advertising.

The punishment idea is certainly carried forward by the deliberate action of Appellants in seizing Appellee's product in far away places rather than Appellee's home district where its business, witnesses, etc., are located, and where it can best defend itself. Appellants have carefully calculated their actions so that the closest places Appellee can get a trial of a consolidated libel action are either the Federal District Court for the Northern District of California in San Francisco or the Federal District Court in Phoenix, Arizona, (R. 293, 1051-1052), both of which are hundreds of miles from Appellee's place of business. When the Motion to Consolidate and Remove to Los Angeles was argued and opposed by Appellants and Judge Fake said, what Appellants have done here is ". . . the equivalent of what our ancestors fought against when they complained about trials beyond the seas . . ." (R. 1051), Appellants "guessed" that Judge Fake would move the consolidated trial to Los Angeles, so rushed in three days later and filed an injunction action in Los Angeles.[85a]

Multiple seizures are not just an ordinary lawsuit and Appellants know this better than anyone else. They know that more than the mere filing of lawsuits is involved here. The ruinous consequences of multiple seizures seldom if ever flow from an ordinary lawsuit. Comparison with

---

[85a] Just as the Court was about to hand down a decision on Appellee's motion to consolidate the Government Attorney forestalled a decision by requesting time to file a brief. When the Court inquired how much time was necessary Government Counsel answered: "' . . . there isn't any rush about this thing, as far as I can see" (R. 1052). See also R. 265-268 on delay in Criminal Case.

other lawsuits is therefore not an apt parallel. Appellants know that there is nothing more damning in the Food Supplement field than the widespread release of information that the Government is "after" or out to "get" Nutrilite. They know that competitors and others repeat the damning bad news over and over. The things said by Appellants and the smearing publicity Appellants have released are grist for this defamation mill.

Because of their years of experience Appellants knew that the effect of this publicity on the multiple seizures in strategically located parts of the United States would be that a tremendous blow will be struck thereby to the business of Appellee—a blow since it is of intangible injury to good will and reputation, which would be an injury from which it is difficult if not impossible to recover.[86] Publicity showing that Appellee has disproved all the unfounded claims of Appellants will never get the coverage which Appellants secured for their charges. Newspapers usually give prominence only to "attacks" and "bad" news. The charges can be cleared but the stigma of being the subject of drastic governmental action lingers on and on. Appellants have as to Appellee "stigmatized their reputation (and that of their product) and seriously impaired their chance to earn a living" by action which *they say* can "never be challenged in any court." It is believed "Our Constitution did not contemplate such a result." *United States* v. *Lovett,* 328 U. S. 303, 314.

Appellants in their famous "pressure" memorandum (R. 67-68) clearly indicated that their purpose was punishment rather than public protection. Protection of the public is not even mentioned when outlining their "pressure" scheme. Evidently the Appellants had some doubts about

[86] Publicity is recognized as a device whereby governmental punishment is and can be inflicted. Landis, *Administrative Process* (1938) pages 90, 108-110; Davis, *The Administrative Power of Investigation* (1947), 56 Yale L. J. 1111 at 1136.

getting by with their penalty pressure scheme, as they say in their "pressure" memorandum that they are going to make all the seizures they can up *"until an injunction is granted or the criminal case goes to trial"* (R. 67-68). They must have anticipated that an injunction would be granted in this case and that they would speedily lose in the criminal case, but they wanted to hurt Appellee as much as they could before that time. Appellants' whole far-flung geographic pattern of seizures reveals a deliberate plan to harass, oppress and ruin Appellee's business rather than determine the character of Appellee's labeling. The embargoes (R. 730, 751, par. 13) which Appellants persuaded state and local officials to place on Appellee's product were obtained by "untrue information" (R. 533, Item 11). The Appellants confirmed this by offering this evidence of untruth as a part of their own case (R. 531). Trial of a libel case is not even mentioned as a possibility in their "pressure memorandum." Clearly they wanted no trial to take place.

The Court found that:

> "The defendants have caused embargoes to be instituted and placed on Nutrilite prior to the institution of libel for condemnation proceedings in New York, New Jersey, Washington State, Florida, and various localities in the United States by requests to State and local health authorities, which embargoes naturally frightened agents, distributors and customers of Nutrilite and had very much the same damaging and injurious effect as the seizures. These embargoes obtained in widely scattered jurisdictions of the United States caused maximum and irreparable injury to plaintiff" (R. 769).

In the recent case of *Reilly* v. *Pinkus*, 338 U. S. 269, this Court had occasion to refer to the dissenting opinion by Justices Brandeis and Holmes in the case of *Milwaukee Publishing Company* v. *Burleson*, 255 U. S. 407, 417 *et seq.* The language of that dissent is most appropriate to the

facts in the instant case, as that dissenting opinion was based on the reasoning that the order cancelling second class mail privileges of a newspaper for violating the Espionage Act was under the facts of that case, really a "punishment" rather than a preventive measure to protect the public. Mr. Justice Brandeis there stated at page 433:

> "The order . . . was clearly punitive, not a preventive measure; as all classes of mail except the second were, as the Postmaster General states, left open to it provided it had sufficient financial resources . . . The actual and intended effect of the order was merely to impose a very heavy fine, possibly $150 per day . . . But the trial and punishment of crimes is a function which the Constitution, Article 3, § 2, cl. 3, intrusts to the judiciary. *I am not aware that any other civil administrative officer has assumed, in any country in which the common law prevails, the power to inflict upon a citizen severe punishment for an infamous crime.* Possibly the court would hold that Congress could not, in view of Article 3 of the Constitution, confer upon the Postmaster General, *as a mere incident in the administration of his Department*, authority to issue an order which could operate only as a punishment. . . .
>
> ". . . What is in effect a very heavy fine has been imposed by the Postmaster General . . . It may be that the Court would hold, in view of Article 6 in our Bill of Rights, that Congress is without power to confer upon the Postmaster General . . . authority to inflict indirectly such a substantial punishment . . .
>
> "The punishment inflicted is not only unusual in character, it is, so far as known, unprecedented in American legal history. Every fine imposed by a court is definite in amount . . . But here a fine imposed for a past offense is made to grow indefinitely each day."

And at page 436:

> ". . . If, under the Constitution, administrative officers may, as a mere incident of the peacetime administration of their departments, be vested with the power

to issue such orders as this, there is little of substance in our Bill of Rights, and in every extension of governmental functions lurks a new danger to civil liberty." (Italics supplied.)

There is no doubt but that the Appellants have inflicted cruel and unusual punishment on Appellee without any semblance of a trial. The fact that this punishment is accomplished by seizing property rather than deprivation of personal liberty "makes it no less galling or effective than if it had been done by an Act (action) which designated the conduct as criminal." *United States* v. *Lovett*, 328 U. S. 303, 316. From January, 1949 on, Appellee has repeatedly called Appellants' attention to the fact that the best way a speedy trial could be had was for Appellants to file an injunction case in Los Angeles.[87] It was not until September, 1949, that the Appellants actually got around to filing such an injunction.[88] This clearly proves they did not want an early and speedy trial but wanted to unmercifully punish Appellee as long as possible.

The tremendous crushing effect of the multiple seizures imposing the sales loss of $100,000 per month, the demoralization of Appellee's sales organization and all the other effects listed in the Findings of Fact[89] certainly indicate beyond question that Mr. Justice Brandeis' words apply equally to the instant case.

In many cases this Court has invalidated state statutes imposing excessive penalities from which there was no adequate judicial protection and those cases contain rules of fundamental fairness flowing from the due process clause of the Fourteenth Amendment which Appellee believes are applicable in the instant case. *Oklahoma Operating Co.* v. *Love*, 252 U. S. 331, 337; *Missouri Pacific Ry. Co.* v. *Tucker*, 230 U. S. 340, 347.

---

[87] R. 608, 628-629. See also Appellants' brief page 7, note 3.

[88] Finding 37, R. 768.

[89] Finding 39, R. 769.

In our case the tremendous penalties inflicted by Appellants prior to any possible decision on the merits of Appellants' charges, in feigned enforcement of the Act for which no possible remedy exists, if a court of equity is helpless herein, clearly violate due process requirements. Appellants say Appelle has no statutory remedy at all against arbitrary, capricious and oppressive abuse of power by Appellants prior to a final decision in a libel case (if the statute here in question authorizes Appellants to do what they have done and is constitutional). See *infra* pages 151-165.

Further, the libel court may have the matter under consideration for a considerable period of time and then the Government may appeal the adverse judgment and all the time during which the appeal is pending, or at any other time, the libel court cannot grant an injunction stopping the Government from making further seizures. Since the statute does not provide, according to Appellants, any instance in which an injunction can be granted against them to prevent their abuse of power. Even if they lose a libel case they still can make seizures according to what Appellants say for they are always unstoppable regardless of what they do up until the libel courts act on these further seizures. As the libel courts would obviously dismiss these seizures as *res adjudicata* should not a court of equity have power to stop 5,000 seizures under such an obvious abuse of power? It is to be noted that Section 304(a) allows the Appellants to make unlimited seizures in cases where they win a judgment that a product is misbranded, but an alternative provision prohibiting Appellants from making multiple seizures in cases where the Appellants lose *is not contained in the statute,* so if resort to the equity courts is barred to prevent abuse even in such cases an appalling situation exists. Surely Appellants' contentions are unsound in view of the damage Appellants can do before a plea of *res adjudicata* can be heard!

Here the Appellants have "thrown the book" by bringing the *four* possible actions authorized by the statute, i.e., (1) criminal indictment, (2) a libel action, (3) multiple libel seizures, and (4) an injunction action. The multiple seizures which are the basis of the instant complaint were based on claims the basis of which had not then been authoritatively determined (although most definitely determined against Appellants by the Trial Court herein). Because of the multiple seizures Appellee is subject to the imposition of terrific penalties which are of such a character that money damages cannot possibly compensate for them, and even those damages which are allowable cannot be recovered.

In *Lipke* v. *Lederer*, 259 U. S. 557, a provision of the National Prohibition Act allowing a Collector of Internal Revenue to collect a liquor tax without hearing was held unconstitutional on the ground that it was not really a tax but a penalty. The Court said in part at page 562:

> ". . . We cannot conclude, in the absence of language admitting of no other construction, that Congress intended that penalties for crime should be enforced through secret findings and summary action of executive officers. The guarantees of due process of law and trial by jury are not to be forgotten or disregarded. . . ."

In the instant case that is exactly what has happened as enormous penalties have been imposed by secret findings and summary action of executive officers. *Cf. United States* v. *Constantine*, 296 U. S. 287.

It cannot be successfully argued that Congress intended the punishment result here achieved by Appellants because W. G. Campbell, then Chief of the Food and Drug Administration, in testifying at the hearings on S. 5, 74th Congress, on multiple seizures, said that his agency did not object to adequate legislative guarantees so that "undue penalties will not be visited through imprudent, intemperate, and extreme administrative methods of law enforce-

ment." Dunn, FEDERAL FOOD, DRUG AND COSMETIC ACT (1938), 1263.

The Court herein found (Finding 22, R. 736-764) that:

> "There are no separate issues of fact or law necessitating more than one such action. . . . These libel seizure actions having been instituted in widely separated jurisdictions in the United States inflicted *unnecessary punishment* . . . on the plaintiff." (Italics supplied.)

This Court said, *in Re Oliver, supra* at 278:

> "It is the 'law of the land' that no man's life, liberty or property be forfeited as a *punishment until* there has been a charge fairly made and fairly tried in a public tribunal." (Italics supplied.)

Yet secrecy is the earmark of Appellants' decisions herein.

It is significant to note that in *National Remedy Co.* v. *Hyde,* 50 Fed. (2d) 1066, (CCA, D. C., 1931) an action was brought to enjoin multiple seizures under circumstances almost identical with those presented here. The seizures were instituted under the Food and Drug Act of 1906 which was administered by the Department of Agriculture. The Court of Appeals, in reversing the action of the District Court in dismissing Appellants' complaint for injunctive relief, stated in part as follows at page 1068:

> "In *Ex parte Young,* 209 U. S. 123, it was held that, while there is no rule permitting a person to disobey a statute with impunity at least once for the purpose of testing its validity, when such validity can only be determined by judicial determination and construction, a provision in the statute which imposes such severe penalties for disobedience of its provisions as to intimidate the parties affected from resorting to the courts to test its validity practically prohibits those parties from seeking such judicial construction and denies them the equal protection of the law. In the present case, the action and proposed action of the Department would, under the averments of the bill, in effect deprive

> appellant of its property through the destruction of its business before the issues involved could be determined by the court. The result, therefore, would be little different than as though no provision had been made for judicial review. Such a course of conduct on the part of the Department amounts to arbitrary exercise of power, and is a deprivation of due process of law."

The awful and devastating consequence of these 11 seizures are shown by the record.[90] If Appellants had been allowed to use uncontrollable power to make 100 or more seizures, and they could have made 5,000, the consequences are a certain death of Appellee's business. The Court found (Finding 41, R. 769-770):

> That plaintiff would have been subjected to many additional seizures of its product throughout the United States in addition to the existing 11 seizures of its product, if not enjoined from so doing, is admitted by defendants. It was a general policy and plan of the defendants to make with all possible speed many seizures of plaintiff's product. Such additional seizures, and the product could be seized by defendants in the hands of more than 5,000 of plaintiff's distributors, would have the effect of destroying plaintiff's business prior to any possible adjudication of the disputed issues on plaintiff's labeling in any of the libel actions already filed or threatened."

Surely the irreparable injury inflicted herein is a punishment and most assuredly it has been inflicted in a fashion premeditatedly designed to make it a lasting non-eradicatable punishment. Never will the weapon of publicity to ruin a reputation be used with greater definiteness of purpose. A procedure which is so unfair for inflicting a penalty is not rendered fair by using it under the label of "public protection" in an attempt to expand Appellants' powers. *Cf. Gegiow* v. *Uhl*, 239 U. S. 3, 10; *Waite* v. *Macy*, 246 U. S.

---

[90] Finding 39, R. 769.

606, 608. Power is certainly used for abusive purposes when the shock of its impact is so shatteringly unreasonable.

Surely the use of multiple seizures here as a punishment as inflicted by Appellants under the facts in this case was not really authorized by the Congress in Section 304(a) of the Food, Drug and Cosmetic Act and if authorized by that provision Appellee respectfully submits that it violates the due process of law guaranteed to it by the Fifth Amendment. See *infra* pages 151-165.

(g) Conclusions on Statutory Violation

Considering all of the facts and absence of facts herein reviewed, Appellee earnestly urges that what Appellants have done cannot reasonably be said to be a compliance with that part of Section 304(a) here involved. In all the annals of administrative agencies it is not believed that there is a record revealing so flagrantly, so many violations of fundamental fairness as that revealed by the Record and Findings of Fact in this case.

It is developed in other parts of this brief that Appellee is entitled under the due process clause to be treated fairly and that statutes should be read so as to require this treatment if it is at all possible to do so. A purpose of allowing uncontrollable action under a provision as bitterly fought in the Congress as multiple seizures should not lightly be attributed to the Congress.[91] The language used as well as its legislative history indicates that under the facts herein the Appellants have violated the statutory mandate.

12. Libel and Law Courts Offer No Remedy Against Appellants' Arbitrary, Capricious and Oppressive Action

Appellants argue (pp. 65-74) that Appellee has an adequate remedy at law so the District Court lacked jurisdiction. The remedy said to be adequate is that offered by the

[91] See *Cavers, Supra*, note 83.

libel courts. This section of Appellee's brief shows that such courts offer no adequate remedy for the irreparable injury herein complained of.

(a). Libel Courts Provide no Stay of Further Seizures Pendente Lite

Appellants say that Appellee has a remedy against multiple *trials* of the multiple *seizures* in the right given to consolidate the libels into one case for trial. This is an inadequate remedy and, in fact, no remedy at all for it is the *seizures* which are irreparably injuring Appellee here. Neither a libel court nor a court in which the libels are consolidated has any power to stay further seizures until there has been a trial of a consolidated or a libel action involving instances like this case where the same issues of law and fact are involved in multiple seizure actions. Also, while the pending cases are being consolidated Appellants could ruin Appellee beyond any possible recoupment by a victory in the libel case by making the possible 5,000 seizures (Finding 41, R. 769-770) in a week through use of their mimeographed papers and telegram plan (R. 67).

Appellants have made 11 seizures and admittedly had their seizure papers all "mimeographed" up and telegrams were to be used so they could "speedily" make more seizures as a part of the "pressure" campaign outlined in Appellants' "pressure memorandum."[92] Appellee has more than 5,000 distributors[93] from whom seizures could be made, the names and addresses of each is presumably in Appellants' possession (R. 533-534, 767) and it is conceivable that the seizures would have numbered in the hundreds and Appellee's business would have practically been brought to a standstill within a few days if the injunction had not been granted herein to stop seizures on the basis of the Kingsley

[92] Finding 32, R. 766, R. 67.

[93] Finding 3, R. 757.

decisions. (Finding 41, R. 769-770). The "Pressure Memorandum" does not say seizures are to stop if a consolidation of any of the libels for trial is effected.

Appellants can go back to the same distributor and make a seizure every time he receives a shipment and harass the distributor out of existence—they made two seizures in Belleville, New Jersey [94] and two in Chicago.[95] Appellee is really at the mercy of uncontrollable destruction by Appellants if a court of equity is powerless to aid it.

Appellants when contacted by Appellee in November, 1948 after 3 seizures had been made, did not indicate they would stop seizures if these 3 were consolidated into one (R. 311, 327, 764), and have made no promise to stop further seizures if the 11 are so consolidated. In fact they have indicated just the opposite.[96] This means the next 11 or 100 cases would be consolidated into another trial and then the next seizures so consolidated and so on and on as more cases are filed. There is no special power given by the statute to any court to consolidate into one trial the consolidated trials and from the obstructive, delaying and technical tactics adopted by Appellants so far on the attempt to consolidate the first 11 seizures, it is obvious they would oppose consolidation of the consolidated trials on that ground.[96a]

There is no way *under the Act* to stop Appellants from further seizures until one of the consolidated trials has

---

[94] Findings 16 and 31, R. 761, 766.

[95] Finding 31, R. 766.

[96] Finding 32, R. 766. See also R. 412.

[96a] Appellants, in footnote 40, p. 66 of their brief contend a libel case cannot be removed to Appellee's home district where Appellants on September 22, 1949 filed an injunction suit involving identical issues (R. 768). Appellants do not mention removal provisions of the new Judicial Code, 28 USC § 1404 as interpreted in *United States* v. *National City Lines*, 337 U. S. 78; *Ex Parte Collett*, 337 U. S. 55 and *Kilpatrick* v. *Texas and Pacific R. Co.*, 337 U. S. 75. See note 35 *supra* page 17.

been concluded. The statement by Appellants (pp. 66-67) that if Appellee had moved to consolidate in the Fall of 1948 a trial could have been had in a libel court by now ignores Appellants' delaying, obstructive, punitive and other tactics outlined herein which have delayed a decision for a year on the first motion to consolidate. (Finding 37, R. 768.) It cannot, therefore, be said that the power to consolidate the libels under the facts in this case is an adequate remedy so as to defeat an action for an injunction.

This Court has held that where particular administrative orders or action could not be suspended *pendente lite* under applicable statutes to prevent irreparable injury *pendente lite*, equitable relief was guaranteed by due process as the statutory remedy is inadequate. In *Ohio Bell Telephone Co.* v. *Commission*, 301 U. S. 292, the Court held that a rate refund order violated due process since there was no intermediate suspension of the order pending judicial review. The Court said at page 303:[97]

> "A different question would be here if such a suit (i.e., independent suit for review) could be maintained with an intermediate suspension of the administrative ruling."

In *Driscoll* v. *Edison Light & Power Co.*, 307 U. S. 104, the Court reversed a three-judge court and upheld a temporary rate fixed by the Pennsylvania Public Utilities Commission but held that if a utility company was not protected against loss by the remedy afforded by a Pennsylvania statute until the merits of the rate increase were settled the remedy was clearly inadequate. There the question of inadequacy of the remedy provided by state law was carefully examined by the Court because the Johnson Act removing Federal jurisdiction where a "plain, speedy and efficient remedy may be had, in law or equity in the courts of such state"

[97] See *supra* pages 49, 74 for prior reference to this case.

was raised as bar to equitable jurisdiction. Of the Pennsylvania statute the Court said at page 110:

> ". . . The remedy at law by appeal is ineffective to protect the utility's position *pendente lite*. The supersedeas does not postpone the application of the temporary rates. The statutory court had jurisdiction of the Bill."

And in *Porter* v. *Investors Syndicate*, 286 U. S. 461, the Court said at pages 470-471:

> "Where ancillary to the review and correction of administrative action, the state statute provides that the complaining party may have a stay until final decision, here is no deprivation of due process. . . . But where either the plain provisions of the statute . . . or the decisions of the courts in interpreting the Act . . . preclude a supersedeas or stay until the legislative process is completed by the final action of the reviewing court, due process is not afforded, and in cases where the other requisites of Federal jurisdiction exist recourse to a Federal court of equity is justified."

It is believed that under the rule relied upon in the above decisions and in spite of distinctions which can be drawn, Appellee has a right to suspension of further seizures pending a decision in the libel courts where, as here, the merits of its labeling is raised under facts indicating no possible injury to any person except Appellee *pendente lite*. No such suspension can, however, come from a libel court. Nor can a libel court stop the use of multiple seizures for "punishment" only as Appellants are using them here. (See *supra* pages 81-93.)

(b) Libel Courts Cannot Consider Arbitrary, Capricious and Oppressive Conduct

The libel courts would not afford Appellee an adequate remedy because the *sole issue* in a libel case is whether Appellee's pamphlet is "misleading in any particular" (Sec-

tion 403(a), 502(a)). The Appellants would not and could not be parties to such suits and, therefore, the libel courts could not decide the issue of arbitrary, capricious and oppressive actions by Appellants or restrain their unlawful, arbitrary, capricious and oppressive conduct. If Appellee's only remedy is in the libel courts it will never get a trial on whether Appellants violated the statute or the constitution by the conduct complained of herein. The cases cited by Appellants (pp. 39-45, brief) involving administrative action and a later hearing, i.e., rent, price, tax assessment, etc., are cases where the later hearing involves the very administrative action taken. That is not true in the instant case as the later hearing in the libel court can never involve whether Appellants were arbitrary in their administrative action in authorizing multiple seizures. Appellants here really argue Appellee is never entitled to have any court inquire into whether they acted illegally in such authorizing decisions. That was not the decision of the Court in the cases they cite and it is most respectfully believed that such a construction clearly violates the due process clause.

It has been held that the legal remedy is never adequate unless it covers the entire case made by the bill seeking relief in equity. In *Township of Hillsborough* v. *Cromwell*, 326 U. S. 620, 628, the Court said:

> "A remedy at law cannot be considered adequate, so as to prevent equitable relief, unless it covers the entire case made by the bill in equity."

Again in *Greene* v. *Louisville & I. R. Co.*, 244 U. S. 499, in a suit to enjoin collection of local and state taxes, it was contended that since the state statue provided that taxes wrongfully collected should be refunded, there was an adequate legal remedy, but the Court found that recent court decisions had modified this statute. The Court said at page 520:

"But were it otherwise, Section 12 clearly applies to state taxes alone, while the bills of complaint herein have to do with both state and local taxes. A remedy at law cannot be considered adequate so as to prevent equitable relief unless it covers the entire case made by the bill in equity. Were we to require a dismissal of these bills as to the state taxes, retain them as to the local taxes, *we should multiply suits, instead of preventing multiplicity of suits. It is a familiar maxim that 'a court of equity ought to do justice completely, and not by halves,' and to this end, having properly acquired jurisdiction of a cause for any purpose, it should dispose of the entire controversy and its incidents, and not remit any part of it to a court of law.*" (Italics supplied)

Appellee in its complaint sought to enjoin the unlawful, arbitrary, capricious and oppressive conduct of Appellants and also questioned the constitutionality of the statute under which they instituted the libels. It was only in the Court below that those questions could have been presented as it is the only court where personal jurisdiction can be acquired over Appellants. The libel courts can have no jurisdiction over the issues or defendants here before the Court. The cases cited *infra* pages 114-118, establish that there is no place in our government under our Constitution for the exercise of purely arbitrary action and that the Courts can enjoin such action where no other adequate remedy exists. Clearly the libel courts cannot offer a remedy against illegal actions of Appellants here as it has no jurisdiction over such an issue or over the Appellants.

(c) Libel Courts Cannot Give Relief for Damages Suffered

The libel courts do not afford Appellee an adequate remedy because they cannot protect against loss of the value of the seized articles (which will be unsalable when recovered, R. 769) nor can these courts give damages for

the intangible loss resulting from destruction visited upon Appellee's business (Finding 39, R. 769).

This Court has recognized inability to recover damages as a proper ground for the equitable relief of injunction. In *Oklahoma Natural Gas Company* v. *Russell*, 261 U. S. 290, a gas company's application for higher rates was denied. On an appeal to the State Supreme Court a supersedeas *pendente lite* was denied. An action was then brought before a Federal three-judge court which dismissed the bill. This Court in holding that the three-judge court was in error, said at page 293:

> "Coming to the principal question, if the plaintiffs respectively can make out their case, as must be assumed for present purposes, they are suffering daily from confiscation under the rate to which they are now limited. They have done all they can under the state law to get relief and cannot get it. If the Supreme Court of the State hereinafter shall change the rate, even nunc pro tunc, the *plaintiffs will have no adequate remedy for what they may have lost before the court shall have acted. . . .*" (Italics supplied)

Just as in the instant case there is no remedy in the libel courts for what Appellee may lose before or after it prevails in those courts.

It might be said that Appellee could recover in damages from Appellants for the value of the seized articles and for loss incurred by the destruction of its business and the injury to its reputation and good will. Appellants admit no such remedy exists (Compl. Para. 16, R. 731, R. 752) and it must be conceded that the decisions of the courts do not offer Appellee much hope of relief in this direction See *Wilkes* v. *Dinsman*, 7 How. 89, 130-131; *Spalding* v. *Vilas*, 161 U. S. 483, 498-499.

Thus recovery in any suit for damages against the Appellants personally would be at best doubtful. This doubt alone has been recognized by this Court as proper grounds

for the issuance of the equitable relief of an injunction. In *Dawson* v. *Kentucky Distillers and Warehouse Co.*, 255 U. S. 288, at page 295 the Court said:

> "It is well settled 'that if the remedy at law be doubtful a court of equity will not decline cognizance of the suit.'"

And in *Davis* v. *Wakelee*, 156 U. S. 680, the Court said at page 688:

> "In the uncertainty which appears to exist .... we think it may be fairly said that the remedy at law is not so plain or clear as to oust a court of equity of jurisdiction. It is a settled principle of equity jurisprudence that if the remedy at law be doubtful a court of equity will not decline cognizance of the suit.... *Where equity can give relief plaintiff ought not to be compelled to speculate upon the chance of his obtaining relief at law.*" (Italics supplied)

Also, the injury to Appellee and to its distributors has been so great and will be so great if Appellants make further seizures, that it is doubtful that any or all of the defendants have sufficient funds to pay a judgment for the amount of such injury. Moreover, even assuming that Appellants would be held liable in an action for damages as far as damage to the seized articles is concerned, money damages recovered from Appellants would be an inadequate remedy. It is this intangible crushing effect on Appellee's good will and reputation which cannot be measured in dollars and cents against which relief is here requested. Even in a case where there could be recovery for the value of goods taken the Court has recognized that relief is inadequate as to the loss of business and good will where as in the instant case it is difficult to evaluate such losses in terms of money. *Watson* v. *Sutherland*, 5 Wall. 74, 80.

So if Appellee admittedly cannot recover even for loss of the seized goods which is just a small part of its total loss, the greater part being the "loss of trade destruction

of credit, and failure of business prospects," those "collateral or consequential damages . . . for which compensation cannot be awarded in a trial at law," (*Watson* v. *Sutherland, supra,* p. 80) it should be clear that it had no adequate remedy in the libel courts and the injunction was necessary and proper.

Congress knew very well what multiple seizures meant and certainly never intended their use as Appellants have used them in this case. For example, Senator Bailey during the debate on this provision said in part:

> "I am selling my goods in 48 states; he seizes them in 40 states, and, even though I go into court a thousand times and prove he is wrong, my business is gone, for a man cannot be universally disgraced by his Government and hope to recover in a lawsuit."

79 Cong. Rec. 4917.

(d) MULTIPLICITY OF ACTIONS NOT AVOIDED BY LIBEL COURTS

Appellants in their brief (pp. 67-71) discuss only multiplicity of trials—*not multiplicity of seizures.* And there is quite a difference. To hold that Appellee had an adequate remedy in the libel courts would necessarily mean the staying of the many actions involving the same issues of fact and law and prevention of further seizures while one action is tried. And as already stated herein the libel court cannot do this. In fact, if equitable relief is not granted to stay a multiplicity of further seizures there would have to be the trial of the consolidated libel actions, or the injunction action, a possible trial of the action against Appellants for personal liability and a trial to determine the constitutionality of that section of the Food and Drug Act under which Appellants acted.

While any or all of these actions are going on the libel courts cannot stop further seizures. Even after one of these cases has been decided *and the labeling issue has been decided in Appellee's favor,* the libel courts (and under Ap-

pellants' theory no other Court) cannot stop Appellants from seizing Appellee's product on the same labeling allegation. To be sure a plea of *res adjudicata* would probably get such actions dismissed but that could come under Appellants' theory, only *after* the seizures—possibly 5,000 of them in a week. See page 89 supra. Under Appellants' theory Appellee must look to the libel courts which could do nothing until after the seizures, so use of the seizures as a punishment device could not be stopped by a court of equity, no matter how unlawful, arbitrary, capricious and oppressive the seizures are, according to Appellants. The Act says Appellants can make all the seizures they want to when once the Government wins a case against such labeling but it does not say the Government must stop seizing when it loses on the issue of labeling.

In the case of *Smyth* v. *Ames*, 169 U. S. 466, where an injunction was granted against the enforcement of rates for transportation imposed by a Nebraska statute making carriers not only liable to individuals for matters prohibited by the statute but also liable for fines on each offense, the Court said at page 517:

> "The transactions along the lines of any one of these railroads out of which causes of action might arise under the statute, are so numerous and varied that the interference of equity could well be justified upon the ground that a general decree according to the prayer of the bills, *would avoid a multiplicity of suits*, and give a remedy more certain and efficacious than could be given in the proceeding instituted against the company in a court of law, for a court of law could only deal with each separate transaction involving the rates to be charged for transportation." (Italics supplied)

So in this case the granting of the injunction certainly avoided a multiplicity of suits.

> "It is a familiar maxim that a court of equity ought to do justice completely, and not by halves, and to this end *having properly acquired jurisdiction of a cause*,

for any purpose, it should dispose of the entire controversy and its incidents, and not remit any part of it to a court of law." (Italics supplied)

Greene v. *Louisville and I. R. Co.*, 244 U. S. 499, 520. Cf. *Porter* v. *Warner Holding Co.*, 328 U. S. 395 (equity required return of excessive rents. "To be sure such a recovery could not be obtained through an independent suit in equity if an adequate legal remedy were available," pp. 399).

In *Landis* v. *North American Co.*, 299 U. S. 248, it was held that a Federal Court has inherent power to stay proceedings in a case on its docket to await the outcome of a test case in another jurisdiction involving the same issues even though the parties are *not* the same. And in *Stark* v. *Wickard*, 321 U. S. 288, 310, this Court said: "If numerous parallel cases are filed, the Courts have ample authority to stay useless litigation until the determination of a test case."

In *Ex Parte Young*, 209 U. S. 123, 160, the Court said, "It would be an injury to complainant to harass it with a multiplicity of suits or litigation generally. . . ."

In *Lee* v. *Bickel*, 292 U. S. 415, 421, Mr. Justice *Cardozo* said the Court there had jurisdiction, "As to this we are not in doubt, the multiplicity of actions necessary for redress at law being sufficient, without reference to other considerations, to uphold the remedy by injunction. *Wilson* v. *Illinois Southern R. Co.*, 263 U. S. 574; *Hill* v. *Wallace*, 259 U. S. 44, 62."

Since libel courts cannot stop a multiplicity of suits, the trial court acted properly herein. No claim is made as Appellants seem to assume (Brief, pp. 67-71) that jurisdiction of the Trial Court was based upon multipilicity *alone* so the the authorities cited by Appellants are inapplicable. The Appellants cite *National Remedy Co.* v. *Hyde*, *supra*, and knowing it is completely against them say the statute it applied was different from the present act. Un-

biased writers disagree entirely with Appellants on this point saying the 1938 Act in Section 304 "codifies"[98] into its written provisions the principles of that case.

Finally the oft repeated irrelevant claim in Appellants' brief that a multiplicity of seizure actions was a regular thing under the Food and Drug Act of 1906 (See Brief, pp. 35, 52) is not exactly accurate—at least not after the *National Remedy* case stopped arbitrary, capricious and oppressive use of multiple seizures.

13. The Decisions Authorizing Multiple Seizures are Reviewable Under the Administrative Procedure Act

All constitutional questions aside, the question is presented as to whether the determinations authorizing the institution of multiple seizures against Appellee's product are reviewable under Section 10 of the Administrative Procedure Act (60 Stat. 237, 5 USC § 1001 et seq.). Appellee respectfully submits that they are under the facts of this case and that they are in fact the very type of administrative evils sought to be cured or minimized by the Act. Appellants argue the contrary in their Brief (pp. 60-61).

---

[98] See Markel, *The Impact of the Federal Administrative Procedure Act on the Federal Food, Drug, and Cosmetic Act* in FEDERAL ADMINISTRATIVE PROCEDURE ACT AND THE ADMINISTRATIVE AGENCIES (New York University School of Law, 1947) at page 397:

> "The purpose of this provision (Section 304(a)) is to avoid unnecessary interference with the business of the producers until an issue of alleged misbranding has been determined by the proper tribunal. The 1906 act did not contain a comparable provision. However, in at least one instance (citing the National Remedy case, *supra)* the Court enjoined the institution of more than one seizure because it appeared to the Court that an unlimited number of seizures constituted an unwarranted interference in the light of the relative importance of the issue of misbranding involved. *This section is virtually a codification of the principle of that case.*" (Italics supplied.)

Mr. Markel was formerly senior attorney for the Food and Drug Administration so he is highly qualified to make such a statement.

(a) Right of Review

Section 10(a) (5 USC 1009a) of the Administrative Procedure Act granting the right of review provides as follows:

> "Any person suffering legal wrong because of any agency action, or adversely affected or aggrieved within the meaning of any relevant statute, shall be entitled to judicial review thereof."

Clearly Appellee has suffered "legal wrong" by the unauthorized and arbitrary action of Appellants in instituting carefully planned and located multiple seizures on a nationwide basis which threaten to destroy Appellee's entire business and good will. Conceding *arguendo*, that "legal wrong" might not exist if Appellants had *fairly* reached their determinations, such is not the case here, where Appellants' determinations were not fairly arrived at and where they were not supported by substantial evidence. It is the fact that Appellants' determinations were arbitrary and capricious which has made the damage to Appellee a "legal wrong" within the purview of Section 10(a) of the Act. Appellants themselves cannot be their own judge of the legality of their own action with no agency or court ever passing on the validity of their actions authorizing multiple seizures. The Administrative Procedure Act gives the courts jurisdiction to judge the legality of such action.[98a]

(b) The Decisions in Question Were Final As to Use of Multiple Seizures

Section 10(c) of the Administrative Procedure Act limits review to "final" administrative action. It provides in part:

> "Every agency action made reviewable by statute and every final agency action for which there is no

[98a] Cf. *United States* v. *Morton Salt Co.*, 70 Sup. Ct. 357, 364.

> other adequate remedy in any court shall be subject to judicial review. Any preliminary, procedural, or intermediate agency action or ruling not directly reviewable shall be subject to review upon review of the final agency action."

Appellants attempt to make much of the last quoted line (p. 49, brief), yet at the same time in reality nullifying their own argument by contending the "final" decisions authorizing use of multiple seizures are never reviewable by any court—and certainly the libel courts have no jurisdiction to review them. The first quoted sentence was obviously intended to negate any intention to make merely preliminary or provisional orders reviewable. As to both sentences, however, it cannot be said that the administrative determinations in the instant case were merely preliminary, procedural or intermediate. The character of the decisions must be determined by their effect and, needless to say, as far as the authority to carry out multiple seizures is concerned these determinations were and are "final." Without the decisions the multiple seizure weapon is not usable—Appellants cannot get into the libel courts more than once unless these administrative decisions are made. Counsel for Appellants said to the Trial Court:

> "Those (multiple seizure) suits could only be brought if this administrative determination were made. If the administrative determination were not made these suits could not be brought" (R. 8).

There is nothing preliminary about decisions which would permit Appellants to wipe out an entire business enterprise by the drastic device of multiple seizures. And "overemphasis upon the mere form of the order may not be permitted to obscure its purpose and effect." *Powell* v. *United States*, 300 U. S. 276, 285. "In determining what is due process of law regard must be had to substance, not to

form." *Chicago, B. & Q. R. Co.* v. *Chicago,* 166 U. S. 226, 235. The same rule should apply to reviewability to prevent injustice under the broad provisions of this new remedial Act. The use of libel court process to effect seizures when no libel court can stop the seizures does not distinguish this case from executive seizures. Looking through fiction to fact these seizures are in substance executive seizures. The courts are not real actors in this picture until after the seizure takes place—their processes under this statute can be and are automatically misused by Appellants. Each of the six judges who has considered any phase of this litigation has indicated adverse reactions to Appellants actions. (See note 55 *supra* p. 40.)

Since the determinations are final in their serious and disastrous impact upon Appellee's valuable property rights, the only other qualification which might preclude judicial review under this Section of the Administrative Procedure Act would be the existence of another adequate remedy. As has been stressed elsewhere in this brief, Appellee is not afforded an adequate remedy in any other court for the trials of the seizure actions not only come too late, but do not and could not involve the question decided in the administrative determinations, nor can the libel courts stop multiple seizures. (See *supra* pp. 94-97.)

The finality of the determinations and the complete absence of any other adequate remedy clearly makes the determinations "reviewable acts" within the purview of Section 10(c) of the Administrative Procedure Act. Appellants' reliance upon *Chicago & Southern Air Lines* v. *Waterman,* 333 U. S. 103, is not believed to be sound as that case seems to have turned on the political, international relations character of the question there involved. The difference in factual foundation of *United States* v. *Los Angeles & Salt Lake R. Co.,* 273 U. S. 299, makes it likewise unreliable here.

(c) The Scope of Review

Subsection (e) of Section 10 provides, in part, that the reviewing court:

> "shall hold unlawful and set aside agency action, findings and conclusions found to be (1) arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law; (2) contrary to constitutional right, power privilege or immunity; (e) in excess of statutory jurisdiction, authority, or short of statutory right; (4) without observance of procedure required by law. . . ."

The action of the Court below clearly did not exceed these established bounds of judicial review for subsection (e) quoted in part above positively states that a reviewing court "shall hold unlawful . . . agency action, findings and conclusion found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law" . . . . The present action certainly falls directly within the scope of review authorized by the language quoted.

(d) The Instant Case Does Not Fall Within the Exceptions to Review Under the Act

Section 10 of the Act excepts from judicial review under the Act any agency actions (1) where statutes preclude judicial review or (2) where the agency actions are by law committed to agency discretion.

In respect to the first exception, it is unusual for statutes to specifically preclude judicial review of administrative action. However, the courts have in some instances construed statutes by their silence as manifesting a legislative intent to withhold judicial review. And Appellants place great reliance on the decision of this Court in *Switchmen's Union of North America* v. *National Mediation Board*, 320 U. S. 297 holding that although the statute there involved did not specifically preclude judicial review the intent of

Congress to preclude judicial review was manifested by the omission of such a provision. *Stark* v. *Wickard*, 321 U. S. 288, 309-310, and *Shields* v. *Utah Idaho Central R. Co.*, 305 U. S. 177, 184, state an opposite conclusion on distinguishable facts. In those cases the decisions up for review were made after notice and hearing so the facts there are unlike those in the instant case. The *Switchmen's Union* case does not hold that a decision *ex parte* without hearing is non-reviewable. *Cf. Utah Fuel Co.* v. *National Bituminous Coal Comm.*, 306 U. S. 56, 60; *Columbia Broadcasting Co.* v. *United States*, 316 U. S. 407.

In the legislative history section of this brief *infra* pages 139-143, Appellee quotes the Congressional report which scuttles Appellants' whole argument on "silence" on judicial review (pp. 58 et seq.) and refutes Appellants' section of its brief entitled "No Review of the Administrative Finding of Probable Cause Was Intended." Appellants did not quote the explanation given by the Committee and set forth *infra* pp. 141-142 for that report shows the Committee thought the courts were always open to stop illegal action and that was the reason for the "silence" in the Act on this subject.[98b] Quite a different picture from that painted in Appellants brief!

Can it justifiably be said that there should be read into Section 304(a) of the Food, Drug and Cosmetic Act a Congressional intent to withhold *under any circumstances* judicial review of determinations of probable cause? It is respectfully submitted that such an intent should not be read into the statute on the true legislative history. Aside from such history, the very nature of the determinations and the tremendous and serious impact of widespread multiple seizures as a result of such determinations would appear to demand that the existence of a nationwide business should not wholly depend on the whim and caprice of an

---

[98b] *Slocum* v. *Delaware, Lackawanna & Western R. Co.*, No. 391, April 10, 1950 on intentional absence of judicial jurisdiction to achieve uniformity is not in point under such a legislative history.

administrative officer. To state contrary to its own report that Congress intended to preclude judicial review despite the immediate and direct damaging consequences of the determinations, would be an injustice to the intelligence, candor, wisdom and responsibility of that legislative body.

The question remains, however, as to whether the determinations under Section 304(a) of the Food, Drug and Cosmetic Act are "agency action .... by law committed to agency discretion" within the intent and meaning of the exception to judicial review provided for in Section 10 of the Administrative Procedure Act. The exact scope and meaning of this exception would appear to be somewhat ambiguous but it is suggested that it merely restates a limitation which the judiciary itself had applied without the necessity of authorizing legislation. It is obvious, not only from the legislative history of the Administrative Procedure Act, but also from other provisions of the Act, that this withholding of judicial review does not apply in all cases where "agency action" is in the broad sense "discretionary." The following colloquy in the Senate when the Administrative Procedure Bill was under discussion by its Author, Senator McCarran, specifically discloses that not all exercises of "agency discretion" were to be excepted (92 Cong. Rec. 2153-2154):

> "Mr. Donnell: 'It has occurred to me that the contention might be made by someone in undertaking to analyze this measure that in any case in which discretion is committed to an agency, there can be no judicial review of action taken by the agency. The point to which I request the Senator to direct his attention is this: In a case in which a person interested asserts that, although the agency does have a discretion vested in it by law, nevertheless there has been an abuse of that discretion, is there any intention on the part of the framers of this bill to preclude a person who claims abuse of discretion from the right to have judicial review of the action so taken by the agency?'
>
> "Mr. McCarran: 'Mr. President, let me say, in answer to the able Senator, that the thought uppermost in

presenting this bill is that where an agency without authority or by caprice makes a decision, then it is subject to review. . . .

"Mr. Donnell: 'But the mere fact that a statute may vest discretion in an agency is not intended by this bill to preclude a party in interest from having a review in the event he claims there has been an abuse of that discretion. Is that correct?'

"Mr. McCarran: '*It must not be an arbitrary discretion.* It must be a judicial discretion; it must be a discretion based on sound reasoning.' * * * (Italics supplied.)

"Mr. Austin: 'Is it not true that among the cases cited by the distinguished Senator were some in which no redress or no review was granted, solely because the statute did not provide for a review.'

"Mr. McCarran: 'That is correct.'

"Mr. Austin: 'And is it not also true that because of the situation in which we are at this moment, this bill is brought forward for the purpose of remedying that defect and providing a review to all persons who suffer a legal wrong or wrongs of the other categories mentioned.'

"Mr. McCarran: 'That is true; the Senator is entirely correct in his statement.'"

To further rebut the contention that all exercises of agency discretion are excepted from the judicial review provided for in Section 10 of the Act, it should be noted that subsection (e) specifically provides that it shall be the duty of the reviewing court "to hold unlawful and set aside agency action, findings, and conclusions found to be (1) arbitrary, capricious, *an abuse of discretion*, or otherwise not in accordance with law." (Italics supplied.) It is submitted that the colloquy quoted *supra* and the foregoing provisions of subsection (e) preclude any contention that *all* exercises of agency discretion are beyond judicial review. Appellee's complaint charged and the Court below found, in effect, that the determinations of the Appellants were arbitrary abuses of the discretion vested in them. It is obvious that

the administrative "discretion" involved here is not "absolute" for otherwise Congress would not have required the determinations of probable cause to be based "upon facts found."

Even if the Administrator has discretion, incident to his power to protect the public, this does not mean that every sort of action the Administrator may take, no matter how unjustified by the exigency or subversive of private right and the jurisdiction of the courts, otherwise available, is conclusively supported by *mere executive fiat*—the contrary is well established. *Sterling* v. *Constantin*, 287 U. S. 378, 400-401.

This Court in its recent decision in *Wong Yang Sung* v. *McGrath* (No. 154—October term 1949) has indicated that the Administrative Procedure Act is to be broadly construed so as to further the legislative intent to sufficiently safeguard private citizens and property from arbitrary and biased administrative action. The long history of the struggle to enact a statute was reviewed at length in the opinion of this Court. It is obvious that in many instances the apprehension of many regarding the "multiplication of federal administrative agencies and expansion of their functions to include adjudications which have a serious impact on private rights" were well-founded. This instant case is a graphic example of the unbridled exercise of administrative power put to arbitrary and biased use. It was stated by this Court in the *Wong Yang Sung* case, *supra:*

> "The Act represents a long period of study and strife; it settles long continued and hard-fought contentions, and enacts a formula upon which opposing social and political forces have come to rest. . . . Experience may reveal defects. But it would be a disservice to our form of government and to the administrative process itself if the courts should fail, so far as the terms of the Act warrant, to give effect to its remedial purposes where the evils it was aimed at appear."

So in the instant case, it would certainly be a "disservice to our form of government and to the administrative process itself" if it should be held that the determinations involved are not subject to judicial review, for it is obvious that "the evils" the Act "was aimed at appear." Surely the consternation and embarrassment of Appellants should not be enough to preclude the Act's obvious applicability. The allowable limits of discretion are for the courts to decide and the law is well settled by the Administrative Procedure Act and by the decisions of this Honorable Court that one who has a discretion cannot exercise it arbitrarily, capriciously and oppressively. No government official has such unrestrainable power. *Sterling* v. *Constantin, supra.*

14. The Court As a Court of Equity Had Jurisdiction to Determine Whether the Decisions of Appellants Were Made Arbitrarily, Capriciously, Unreasonably and Unlawfully

If the arbitrary action of the Appellants in making their decisions was within judicial cognizance, it certainly was not error for the Court below to consider the decisions of the Appellants, as well as the facts and circumstances surrounding those decisions,[99] in order to determine this issue. This is not a case, as Appellants would lead the Court to believe, where the Court below sought to substitute its own judgment for that of Appellants. On the contrary, the Court below found that Appellants had no rational basis whatsoever for their determinations and that the same were not justified under any view of the facts.[100] The cases herein establish that there is no place in our system of government for such an exercise of arbitrary power and that contrary to Appellants' contention (P. 65, Brief) courts of equity can stop such illegal action.

---

[99] *Federal Trade Commission* v. *Cement Institute*, 333 U. S. 683, 704-705.

[100] Findings 12, 17, 18, 29, 30, 31, 32, 35, 42 and 43 (R. 758-770).

All constitutional questions aside and conceding, *arguendo* that the Court below did not have the power to substitute its judgment for that of Appellants, the question remains as to whether or not the District Court had jurisdiction as a Court of equity to inquire into and give relief from the unlawful, arbitrary, capricious and oppressive conduct of Appellants which the record in this case so fully reveals. Appellants make quite a point of this in their brief (pp. 52-74). One answer is that being a Constitutional Court properly convened the Court had jurisdiction to dispose of all questions in the case and the section of this brief *infra* pages 118-124 covers this point. Another answer is that the Administrative Procedure Act confers jurisdiction as is set forth in the preceding section herein. But aside from such considerations Appellants are wrong in their claim of a lack of power in a court of equity to enjoin illegal action of government officials.

In *Dismuke* v. *United States*, 297 U. S. 167, 172, it was held that the determination of an administrative official will be reviewed by the Court and will not be accepted where:

> "he exceeds his authority by making a determination which is arbitrary or capricious or unsupported by evidence . . . or by failing to follow a procedure which satisfies elementary standards of fairness and reasonableness essential to the due conduct of the proceedings which Congress has authorized."

In *Garfield, Secretary of Interior* v. *Goldsby*, 211 U. S. 249, this Court stated at page 262:

> "But, as has been affirmed by this Court in former decisions, there is no place in our constitutional system for the exercise of arbitrary power, and, if the Secretary has exceeded the authority conferred upon him by law, then there is power in the courts to restore the status of the parties aggrieved by such unwarranted action."

In *Waite v. Macy*, 246 U. S. 606, the Court in a decision by Mr. Justice Holmes granted an injunction to void a regulation excluding Prussian blue tea, non-deleterious in character, on the ground it exceeded the statutory powers conferred. The Court, through Mr. Justice Holmes, said at pages 608-609:

> "The government says that the bill is an attempt to control a board in the performance of its statutory duty and to substitute the judgment of a court for that of the board.
>
> "No doubt it is true that this court cannot displace the judgment of the board in any matter within its jurisdiction, but it is equally true that the board cannot enlarge the powers given to it by statute and cover a usurpation by calling it a decision on purity, quality or fitness for consumption. ... ."

In *Lloyd Sabaudo Societa Anonima* v. *Elting*, 287 U. S. 329, the Court through Mr. Justice Stone in granting relief from unauthorized administrative action in an immigration penalty case, stated at pages 335-336:

> "The action of the Secretary (of Labor) is, nevertheless, subject to some judicial review, as the courts below held. The courts may determine whether his action is within his statutory authority . . . whether there was any evidence before him to support his determination . . . and whether the procedures which he adopted in making it satisfies elementary standards of fairness and reasonableness, essential to the due administration of the summary proceeding which Congress has authorized."

and at page 339:

> "The Act of Congress confers on the Secretary great power, but it is not wholly uncontrolled. It is a power which must be exercised fairly, to the end that he may consider all evidence relevant to the determination which he is required to make, that he may arrive justly at his conclusion, and preserve such a record of his ac-

tion that it may be known that he has performed the duty which the law commands."

The opinion in *American School of Magnetic Healing* v. *McAnnulty*, 187 U. S. 94 has been constantly cited by this Court as expounding the established proposition that the courts have jurisdiction to grant relief to a party injured by the unauthorized act of a public official. In that case, it was stated at page 108:

> "That the conduct of the post office is a part of the administrative department of the government is entirely true, but that does not necessarily and always oust the courts of jurisdiction to grant relief to a party aggrieved by any action by the head, or one of the subordinate officials, of that Department, which is unauthorized by the statute under which he assumes to act. The acts of all its officers must be justified by some law, and in case an official violates the law to the injury of an individual the courts generally have jurisdiction to grant relief."

In *Yick Wo* v. *Hopkins*, 118 U. S. 356, this Court, in holding that administrative action violated the commands of the Fourteenth Amendment, stated at pages 369-370:

> "When we consider the nature and theory of our institutions of government, the principles upon which they are supposed to rest, and review the history of their development, we are constrained to conclude that they do not mean to leave room for the play and action of purely personal and arbitrary power."

The opinion further recognized that the courts must have power to grant relief under such circumstances for otherwise, the individual is left to the absolutely uncontrolled and arbitrary action of a public and administrative officer whose action is unauthorized by any law, and is in violation of the rights of the individual. *Cf. Columbia Broadcasting System, Inc.* v. *United States*, 316 U. S. 407 and *Buchanan*

v. *Worley*, 245 U. S. 60 where relief was granted when the result of the illegal action was pressure on others not to contract with the plaintiff just as in the instant case.

The jurisdictional tests established in the cases cited *supra* are clearly met in the instant action. Appellee, in its complaint, not only charged, and subsequently proved in the trial below, that the decisions by Appellants were made illegally; but also charged and proved that such decisions as well as other actions by Appellants, were *arbitrary, capricious* and unreasonable, and that Appellee thereby suffered irreparable damage. In view of the issue as to arbitrary conduct which was before the Court below, it was certainly the duty of that Court to receive evidence relating to how the so-called decisions of probable cause were arrived at. To contend that the decisions by Appellants were beyond judicial inquiry irrespective of charges made, and in fact established, would place in the hands of such administrative officials an administrative power of such tremendous and unlimited impact which would be not only alien to our entire constitutional scheme but unparalleled in any governmental system adhering to the principles of justice under law. Courts of equity have always had jurisdiction to give relief under the circumstances of this case.

15. Three-Judge Court Must Try and Decide All Issues of the Case

(a) The Statute Gives the 3-Judges Jurisdiction to Decide All Issues in the Case—Text and Legislative History

There are three three-judge court statutes—one relates to Interstate Commerce Commission cases, another to applications for injunctions to restrain the enforcement of state statutes, and the third to such applications with refer-

ence to Federal statutes. The two latter statutes are the same in wording (28 USC 2281 and 2282). All are governed as to composition and procedure by the same provisions (id. 2284). The statute respecting three-judge courts in such cases respecting Federal statutes was deliberately drawn to parallel the earlier statute applicable to such cases involving state statutes (House Report No. 1679, 77th Congress, pp. 6, 8; and see also 88 Cong. Rec. 7045 in the Senate). This Court customarily refers to precedents under any of them in deciding cases involving any one of them. Appellee does the same herein.

The statute makes detailed provisions for the determination of all issues by the full court of three judges. Thus the court of three judges, when duly designated, "shall serve as members of the court to hear and determine the action or proceeding" (28 USC 2284(1)). They do not serve merely to determine the constitutional issues but "to hear and determine *the action or proceeding.*" Obviously the words "to hear and determine" may not be limited to hearing and determination of constitutional issues only, because they expressly relate to "the action or proceeding."

The scheme of the statute thus seems very plain. It provides, first, that *applications* for injunctions must be "heard and determined by a court of three judges" (28 USC 2282). The three judges "*shall* . . . hear and determine *the action or proceeding*" (28 USC 2284(1)). The only exceptions are that (1) the original district judge may grant a temporary restraining order pending hearing thereon by the full three-judge court and (2) any one of the three judges may perform such functions as do not involve the trial of the case or the entry of any judgment subject to appeal to the full three judges from any action by a single judge.

The foregoing detailed provisions of the statute were adopted in 1942 and, in combination with other provisions of a similar nature already existing, were restated in the new Judicial Code as quoted above. The latter embodies

mainly the provisions of the 1942 statute (56 Stat. 198 at 199, formerly 28 USC 792). The report and hearings in the House of Representatives are embodied in a single document (Rep. No. 1677, 77th Congress, on H. R. 4812) which contains the following:

> "Mr. Kefauver * * * The bill provides that in preliminary matters where the case is tried by a three-judge court that one judge may handle the proceedings and enter all orders required by the Rules of Civil Procedure up to the time of final action in the case. The matter of determining the ultimate decision on the facts or on the law is, of course, left to the three judges. * * *"

See also the Conference Committee report at 88 Cong. Rec. 3069. The Senate Committee, although it redrafted the bill, similarly reported its purpose as being to permit "any one of the judges designated to the three-judge court . . . to perform all preliminary functions" except that "the actual trial of the final issues must be by the full three-judge court" (88 Cong. Rec. 1970).

(b) The Decisions of This Court Hold the 3-Judge Court Has Jurisdiction to Decide All Issues

In *Louisville & N. R. R. Co.* v. *Garrett*, 231 U. S. 298, constitutionality was raised under both the federal and state constitutions. Decision of the latter would of course make unnecessary decision of the former question, if the court should hold that there was invalidity under the state constitution. The question whether, in these circumstances, the federal three-judge court had jurisdiction was squarely raised and the Court said:

> "Because of the Federal questions raised by the bill the . . . Court had jurisdiction and was *authorized to determine all the questions in the case.* . . . Where such a (constitutional) question is presented, the application is within the provision, and this being so, it cannot be supposed that it was the intention of Congress

> to compel the exclusion of other grounds and thus to require a separate motion for preliminary injunction, and a separate hearing and appeal, with respect to the local questions which are involved in the case and would properly be the subject of consideration in determining the propriety of granting an injunction pending suit. The local questions arising under the state constitution *and statutes* were therefore before the . . . Court and the appeal brings them here. *They may be first considered.*" (pp. 303-304, italics supplied.)

In so ruling the Court referred to *Siler* v. *Louisville & Nashville R. R. Co.*, 213 U. S. 175, which was not a three-judge court case but in which interpretation of the state statute (pp. 177, 178, 191) as well as federal constitutionality was involved and the Court, in disposing of the case on applicability of the statute (pp. 194, 198), said at page 191:

> ". . . that court had the right to decide all the questions in the case, even though it decided the Federal questions adversely to the party raising them, or even if it omitted to decide them at all, but decided the cases on local or state questions only. This Court has the same right, and can if it deem it proper, decide the local question only and omit to decide the Federal questions, or decide them adversely to the party claiming their benefit. . . ."

and at page 193:

> "The various questions are entirely separate from each other. Under these circumstances there can be no doubt that the . . . Court obtained jurisdiction over the case by virtue of the Federal questions set up in the bill, without reference to the particular violation set up in regard to the Fourteenth Amendment."

See also *Field* v. *Barber Asphalt Co.*, 194 U. S. 618, 620, 621; *Michigan Cen. R. R.* v. *Vreeland*, 227 U. S. 59, 63; *Greene* v. *Louisville & Interurban R. Co.*, 244 U. S. 499, 508;

Waggoner Estate v. *Wichita County*, 273 U. S. 113, 116; and *Northwest Laundry* v. *City of Des Moines*, 239 U. S. 486, 491. Thus the rule that federal three-judge courts should decide all issues was established as long ago as 1913 and, as we next show, has not been departed from in any type of reported three-judge court case.

In *Sterling* v. *Constantin*, 287 U. S. 378, the complaint sought to enjoin the governor of Texas from use of the military in civil affairs. It raised questions both of interpretation of the state statutes (that is, their applicability) and their constitutionality. The Court said (pp. 393-394):

> "As the validity of provisions of the state constitution and statutes, if they could be deemed to authorize the action of the Governor, was challenged, the application for injunction was properly heard by three judges. . . . The jurisdiction of the District Court so constituted, (of three judges) and of this Court upon appeal, extends to every question involved, whether of state or federal law, and enables the court to rest its judgment on the decision of such of the questions as in its opinion effectively dispose of the case."

Thus it was that the case involved not merely constitutionality but, preliminarily, the interpretation of statutes so far as they might be "deemed to authorize the action" sought to be enjoined. That is precisely the situation in the case at bar. There the question of the authority of the state official defendant was discussed at length (pp. 395 et seq.) although the Court found it possible to "assume, without deciding, that the law of the State authorizes what the Governor has done" (p. 396).

In *Davis* v. *Wallace*, 257 U. S. 478, there were questions both of (a) coverage of the statutes involved and (b) their constitutionality (p. 481). The Court, in deciding the case on the proper interpretation of the statute rather than its constitutionality, said (p. 482):

> "The case made by the bill involved a real and substantial question under the Constitution of the United States. . . . In such a case the jurisdiction of that court, and ours in reviewing its action, extends to every question involved, whether of federal or state law, and enables the court to rest its judgment or decree on the decision of such of the questions as in its opinion effectively dispose of the case."

See to the same effect *R. R. Commission* v. *Pacific Gas Co.*, 302 U. S. 388, 391; *Ohio Tax Cases*, 232 U. S. 576, 586-587; *Lee* v. *Bickell*, 292 U. S. 415, 425; *Query* v. *United States*, 316 U. S. 486, 488-490; *Driscoll* v. *Edison Light & Power Co.*, 307 U. S. 104, 115.

In *Public Service Commission of Missouri* v. *Brashear Freight Lines*, 312 U. S. 621, the Court again reiterated the established principle that a special three-judge court, once properly convened in cases seeking injunctive relief from an allegedly unconstitutional statute, has jurisdiction to determine every question involved in the litigation. In that case, it was stated at page 625:

> "A District Court composed of three judges under § 266 of course has jurisdiction to determine every question involved in the litigation pertaining to the prayer for injunctive relief, *in order that a single lawsuit may afford final and authoritative decision of the controversy between the parties.*" (Italics supplied.)

Not merely in recognition of the indubitable state of the law on the question here presented, but as a matter of good public policy as well, attorneys for the Department of Justice have in other cases taken the same position. We shall not pause to review, or even cite, the various briefs in which that position is expressed save one. *Colonial Airlines* v. *Adams et al.*, 87 F. Supp. 242, No. 3490-49, was decided by the United States District Court for the District of Columbia, three judges participating, on November 16, 1949. There in the course of the proceedings before the full three-

judge court the Government, in defending public officials there sued, submitted a *Memorandum of Law on Jurisdiction of Three-Judge Court which states* (p. 1):

> "It is settled law that in any proceeding seeking to restrain or enjoin the enforcement, operation or execution of an Act of Congress because of repugnance to the Constitution in which a substantial question as to the constitutionality of such Act is presented, the district court of three judges convened to hear such proceeding pursuant to Sections 2282 and 2284 of the Judicial Code (Title 28, USC) has jurisdiction to consider all issues in such proceeding, whether or not such other issues present constitutional questions. Consequently, unless it should hold that no substantial issue as to the constitutionality of the Civil Aeronautics Act is presented by the complaint, the three-judge court convened in this matter has jurisdiction to hear and decide all the issues presented by the complaint."

That is precisely Appellee's position in the instant case.

It is respectfully submitted that the decisions cited *supra* unequivocably establish that the jurisdiction of the District Court below extended to every question involved in the litigation. Appellants apparently concede that the issue on arbitrary, capricious, oppressive and unlawful action and the issue on constitutionality were properly before the Court, but claim the issue of whether Appellee's labeling was misleading should not have been decided. That latter issue is therefore the subject of the next section herein.

16. Whether Appellee's Pamphlet Violated the Statute was an Issue Properly Decided by the Trial Court

In the instant case, Appellants cite as error the holding of the Three-Judge District Court "that it had jurisdiction to try in a *de novo* proceeding the question whether Appellee's labeling was "misleading in any particular. . . ." (Appellants' Brief p. 26.) This is not a correct statement of the Court's decision. Appellants are in error in speaking

of trying the issue as a "*de novo proceeding.*" "*De Novo*" means to try again. In the instant case that issue was not decided at all by Appellants six *ex parte* decisions or by any other officer or body. Appellants' decisions related to whether the labeling was "in a material respect misleading to the injury or damage of the purchaser or consumer." The Trial Court herein was really considering the question of "misleading in any particular" for the first time, not "*de novo.*"

Appellants contend that the only courts having jurisdiction to inquire into the merits of Appellee's advertising booklets are the various District Courts where the libel seizure papers have been filed, or in a District Court where the numerous libels may be consolidated, the basis for this contention being that Congress did not specifically provide for the determination of such issues in Courts other than where the libels were filed or where libels involving the same alleged misbranding were consolidated. But Congress did *not* specifically take such issues from other courts acquiring jurisdiction of such issues in some other manner. Apparently recognizing that their position is untenable because injunction courts, criminal courts and other types of courts can and must try such issues, Appellants immediately put in a footnote saying "The issue may also be determined, of course, in district courts in which the Government may institute other types of enforcement proceedings" (N. 48, P. 75). The issue can also come up in other types of litigation. Here Appellants themselves on September 22, 1949 sought to take the very issue in the libel cases from the libel courts by filing an injunction action in Los Angeles raising the identical issues before the libel courts. See *supra* p. 17. It is respectfully submitted that this assignment of error is without merit.

The Three-Judge Court below was appointed when Appellee filed a *complaint for injunction* seeking to enjoin multiple libel proceedings on the ground that the so-called

administrative "determinations" or decisions authorizing such multiple seizures were arbitrary, capricious, unreasonable and unlawful and that the multiple seizure provisions of the Food, Drug and Cosmetic Act of 1938 were unconstitutional. Since Appellee's complaint sought to enjoin the enforcement of operation of an Act of Congress for repugnance to the Constitution of the United States, it was mandatory, as explained *supra* pages 118-120, that Appellee's complaint be heard by a District Court composed of three judges. Furthermore, since the suit was against the Appellants in their individual capacities rather than a suit against the United States, it was necessary that the suit be filed in the United States District Court for the District of Columbia in order that personal jurisdiction be obtained over the Appellants. It would not have been possible to bring suit elsewhere.

Ancillary to but inseparable from the two fundamental issues framed below was the question as to whether or not Appellee's advertising pamphlets were in fact misleading as alleged in the various libel actions. It was this issue which actually gives rise to the entire controversy between the parties (R. 757, 770). A decision in it was necessary to dispose of the issues in this case. From the beginning of this litigation Appellants have concentrated on the merits of these pamphlets. Appellants apparently realized from the outset they could not defend by disproving the arbitrary conduct charge—as on that issue their own admissions resolve the issue against them. They have therefore concerned themselves only with wild charges about the pamphlets hoping to gloss over their actions. As has already been pointed out herein, Appellants' brief follows this same procedure.

In order to prove that Appellee had "clean hands" and was entitled to equitable relief, Appellee necessarily had to prove it was not a law violator—or as Judge Goldsborough said, was entitled to prove it is "not a crook,"

(R. 53-54) as "crooks" are not entitled to the aid of equity. That Appellants could continually make their unfounded charges and never have those charges heard and disposed of is unthinkable.

Almost the first words uttered in their defense by Appellants were that Appellee was a criminal and law violator because of the use of these booklets. (R. 575, 580, Argument Jan. 24, 1949 before J. Pine.) Appellants in their briefs in support of their 3 motions to dismiss, their brief here on their Petition for Mandamus and/or Prohibition, their arguments and their evidence made further attacks on the merits of Appellee's labeling. At the argument on the first motion to dismiss Appellants argued "They (Appellee) are not coming into court with clean hands" (R. 580).

Appellee immediately challenged this claim of law violations (R. 582) and unclean hands and in the trial herein as the Court found (Finding 12(f), R. 759-760) completely proved lack of law violations, "clean hands" and its complete good faith. In paragraph 3 of Appellant's Answer to the complaint (R. 749) they claim Nutrilite's labeling conveys the impression that the product is a "cure" even though they knew the direct finding of their own Purchaser survey (R. 39-47) was exactly the opposite. The good faith of Appellee is discussed *supra* pages 44-46.

At the hearing before the Three-Judge Court on the Appellants' motion to dismiss they again charged law violations through use of these booklets (R. 617 *et seq.*) and before this Court at the argument on the Petition for a writ of Prohibition and/or Mandamus Appellants were quick to attempt to besmirch the Appellee as an alleged law violator and insisted upon this Court looking at the 3 pamphlets. They even read excerpts from the pamphlets in their last argument here hoping this Court would think, contrary to the facts, those excerpts and their interpretations thereof were a true picture of the pamphlets. At

every opportunity they have poured forth every choice epithet coined in 43, 35 and 26 (see pp. 18-20 Appellants' brief) years of experience in prosecuting actual law violators in this field and have applied these epithets to Appellee's pamphlets in an attempt to divert attention from their arbitrary, capricious and oppressive conduct herein. All the time Appellants want to talk about the pamphlets but they do not want any Court to inquire into the truth of what they say.

The record herein shows that Appellants based almost their entire case on the unfounded claim, that Appellee was and is a law violator, had unclean hands and was not acting in good faith yet Appellants objected strenuously to the Court's inquiry into these charges. As pointed our *supra* page 30 Appellants really quarrel only with one of the 43 Findings of Fact, i. e., the finding that Appellee's labeling was not misleading. They could not quarrel with the other findings as they offered practically no testimony on anything but the opinions they offered on the labeling. On the labeling issue they offered only the biased opinions of Appellants Dunbar, Crawford, and Larrick who have spent the 43, 35 and 26 years respectively (see pp. 18, 20 of Appellants' brief) prosecuting law breakers. They had made their decisions and were on the stand to defend them to the utmost by using this experience to the utmost. What they said on the stand does not appear in their written decisions so they could say anything bad they could think of—and they used their years of experience to imagine horrible impressions from the words used in Appellee's little pamphlets. It is almost impossible for the fairest minded man in the world to spend so many years prosecuting and not render opinions biased and slanted in that direction. How much more so when Appellants realized their only chance to cover up their arbitrary conduct was to pour on the criticism of Appellee's pamphlets. They had a real incentive

to ignore their survey of the impressions of consumers and purchasers and testify the opposite way.

Appellants objected to the Court's consideration of their charges as they knew that once any Court looked into these questions their unfounded charges would explode in their faces and the full extent of their arbitrary, unreasonable and unlawful conduct would be known. In an effort to hide Appellants' actions behind an immovable curtain they said Appellants "have no interest in" Appellee's "good faith" (R. 48). Also that good faith has nothing to do with the interpretation of the character of Appellee's pamphlets. Conceding for purposes of argument that such may be true in any other Court, in a court of equity good faith certainly is the foundation of Appellee's right to equitable relief.

Appellants would have been quick to move that the Court deny equitable relief if Appellee had failed to prove good faith, clean hands and lack of law violations under such cases as *Precision Co.* v. *Automotive Co.*, 324 U. S. 806, 814 where it is stated that:

> "The guiding doctrine in the case is the equitable maxim that 'he who comes into equity must come with clean hands.' This maxim is far more than a mere banality. It is a self-imposed ordinance that closes the doors of a court of equity to one tainted with inequitableness or bad faith relative to the matter in which he seeks relief, however improper may have been the behavior of the defendants. That doctrine is rooted in the historical concept of a court of equity as a vehicle for affirmatively enforcing the *requirements of conscience and good faith.*"

In *Bein* v. *Heath*, 6 How. 228, 247, the Court stated:

> "It is a principle in chancery that he who asks relief must have acted in good faith. The equitable powers of this court can never be exerted in behalf of one who has acted fraudulently, or who by deceit or any unfair means has gained an advantage."

See also *Holmberg* v. *Armbrecht*, 327 U. S. 392, 396, 397.

Also, under Rule 54(c) of the Federal Rules of Civil Procedure the Court was under a duty to grant complete relief. That Rule provides:

> "Except as to a party against whom a judgment is entered by default, every final judgment shall grant the relief to which the party in whose favor it is rendered is entitled, even if the party has not demanded such relief in his pleadings."

The point made by Appellants (p. 25 Brief) about the prayers for relief in the Complaint overlooks this Rule which is obviously designed to make each case dispose of all issues between the parties *properly raised by the evidence*. Also, Appellants overlook the fact that there is a prayer for "such other, further and general and special relief as the nature of the case may require and the Court may deem proper and just in the premises" (R. 737).

It is one of the established maxims of equity that "a court of equity ought to do justice completely and not by halves." To this end courts sitting as courts of conscience have made it their duty to prevent a multiplicity of suits where they have once obtained jurisdiction for any purpose. This established principle was noted clearly in the decision of this Court in *Greene* v. *Louisville & I. R. Co., Supra*, when it was stated at page 520:

> "A remedy at law cannot be considered adequate, so as to prevent equitable relief, unless it covers the entire case made by the bill in equity. Were we to require a dismissal of these bills as to the state taxes, retaining them as to the local taxes, we should multiply suits, instead of preventing a multiplicity of suits. It is a familiar maxim that 'a court of equity ought to do justice completely and not by halves;' and to this end, having properly acquired jurisdiction of a cause for any purpose, *it should dispose of the entire controversy and its incidents, and not remit any part of it to a court of law.*" (Italics supplied.)

In *Camp* v. *Boyd*, 229 U. S. 530, it was stated at pages 551-552:

> "A court of equity ought to do justice completely and not by halves . . .
>
> "One of the duties of such a court is to prevent a multiplicity of suits, and to this end a court of equity, if obliged to take cognizance of a cause for any purpose, will ordinarily retain it for all purposes, even though this requires it to determine purely legal rights that would not otherwise be within the range of its authority."

In accord: *Porter* v. *Warner Holding Co.*, 328 U. S. 395, 399. See also: *Smyth* v. *Ames*, 169 U. S. 466, 517-518 "a general decree—would avoid a multiplicity of suits"; *Ex Parte Young*, 209 U. S. 123, 160 stopping harassment by "a multiplicity of suits or litigation generally," and the other cases cited *supra* pages 102-105.

Since the District Court below properly obtained jurisdiction by the existence of a substantial constitutional controversy, it was the duty of the court *to dispose of the entire controversy between the parties.* The controversy between the appellants and the appellee clearly arose from the multiple libel actions which were filed against Appellee's product, alleging that Appellee's advertising booklets were misleading (R. 757, 770). Appellants admit that the various libels involve identical issues of law and fact. The *Greene* case, *supra*, pointedly speaks of the duty of a court of equity to dispose of the "entire controversy *and its incidents.*" (Emphasis supplied.) It could hardly be asserted that the issue as to the misleading character of Appellee's booklet raised in the multiple libel seizure actions was not at least an "incident" in the issues of this controversy between the parties. It is respectfully submitted that the issue of the misleading character of the booklets is more than an incident of the controversy between the

parties and is in fact the basis for the entire controversy so it was properly decided by the Trial Court.

It is respectfully submitted that once having properly obtained jurisdiction, the Court below could determine, in the language of *Camp* v. *Boyd, supra*, at page 551 "rights that would not otherwise be within the range of its authority."

During the course of the proceeding below both parties were given full opportunity to present evidence on the issue of the misleading character of Appellee's advertising booklets. A decision on this question was clearly ancillary to the Constitutional question in this case where the court was considering constitutionality "as applied." Appellants had the full opportunity to present everything it had on this issue and used every stratagem, device and effort to establish its unfounded charges but could produce nothing better than biased opinions as against Appellee's evidence from Appellants' files of actual consumer impressions of the pamphlets. Having lost that issue Appellants now seek to raise the claim that the District Court had no jurisdiction to inquire into the actual merits of its charges. It is respectfully submitted that the District Court sitting as a court of equity had the affirmative duty to end the vexations and interminable litigation which Appellants had so unwarrantedly instituted and to terminate forever the entire controversy on the labeling here involved and that is what it did.

17. The Three-Judge District Court Properly Found That Appellee's Labeling Is Not Misleading

The preceding section has answered some of the arguments made by Appellants in their brief (p. 76 *et seq.*) on the merits of Appellee's labeling. But Appellee desires to consider additional points herein and to note that Appellants in discussing the merits of the labeling have again resorted to the device of lifting sentences and statements

out of context, and misstating the facts which were developed in the proceedings below. It is significant that Appellants at page 84 of their brief state that the booklets "must be read in their entirety." Even Kingsley agreed that "picking of statements at random is an unfair way to attack any writing" (R. 510). Suffice it to say, Appellants, in their own statements, condemn the action of Appellants Crawford and Dunbar in basing their decisions on the labeling without reading it in its entirety. Obviously, Appellants' statement that each of the administrative officials based his decision or decisions "upon his own examination and analysis" of the booklets hardly "squares" with the admitted facts.[101]

Appellants state that the evidence presented by Appellee did not seriously challenge the "medical findings of fact upon which the probable cause determinations were made" (p. 79). The fact of record is that not only did Appellee's evidence seriously challenge those "findings" but Appellants' own evidence seriously discredited them. M. A. Blankenhorn, a witness for Appellants, whom Appellants characterize in their brief as "an outstanding medical expert in the field of nutrition," (pp. 104-105) testified on *direct examination* that "informed medical opinion" could not say yes or no to the finding of Butz regarding the "consensus of medical opinion" (R. 438). One of Butz' findings (R. 1173-1174) recites that vitamins and minerals would not be effective in the treatment of irritability, gastric distress, headache and insomnia, yet Appellants' star medical witness, Blankenhorn could not agree with Butz (R. 435). Furthermore, Appellants put into evidence Butz' deposition which contradicts or repudiates in many instances his so-called "findings of fact" (R. 762, 1175-1215, 392-393). At pages 57-60, 73 we have considered the contents of these

---

[101] Findings 17, 30 and 35, R. 761, 765, and 767. See also R. 334, 383, 315, 505, 512-513.

findings attributed to Butz and shown that they cannot be relied upon for any purpose.

Appellants seek to create the impression that the pamphlets hold out that Nutrilite would be effective in the prevention or treatment of such diseases as "heart and coronary diseases, pneumonia, tuberculosis and cancer."[102] Appellee disagrees, and so did the three-judge district Court, with Appellants' so-called interpretation of the labeling. Typical of the perverted justification for their conclusions is their misinterpretation of the reference to "cancer" in the Foreword of the booklets (R. 396, 785, 846, 885). This direct disclaimer Appellants assert is a direct representation that Nutrilite would be efficacious in the treatment of cancer (R. 160-161).[102a] The Court found that the booklets represent to consumers and purchasers no more than that Nutrilite will give to the body an adequate supply of vitamins and minerals so that it will be more healthy (R. 759). The medical testimony below clearly supported this.

On page 82 of their brief Appellants make an attempt to discredit the base of a high concentrate of alfalfa, watercress and parsley contained in Nutrilite by speaking of "quakery" and "nostrums." It is stated in Appellants' brief "they recognized the emphasis of Nutrilite's 'secret base' and its alleged extraordinary merit as characteristic of claims that were prevalent in the heyday of patent medicines and quack nostrums." Then follows reference to R. 316, 334, 400. These references clearly do not support any such statements, not one word being mentioned about Nutrilite's base in the testimony cited. This is typical of Appellants' attempts to mislead this Court. The expert

[102] It should be noted that Dr. Myers testified at considerable length about the relationship of vitamin and mineral deficiencies to sudden cardiac collapse (R. 81, 133-134). Furthermore, the medical testimony below directly recognized the relationship of vitamin and mineral deficiencies to the incidence of tuberculosis (R. 144, 433, 477).

[102a] See pages 42-43 *supra*.

testimony for both parties below recognized that this base contains what has been termed "trace" elements and that the same are essential in human nutrition (R. 163-164, 480, 1199, 1524). Furthermore, it is this unique base which does set Nutrilite apart from all other food supplements (R. 163, 1182, 1199).

Appellants' brief then follows with many quotations from the three booklets which are not only lifted out of context but also eliminate qualifying words and phrases contained in the sentences from which the quotes are lifted. In other instances, Appellants resort to the device of deliberately paraphrasing so that it creates innuendos, implications and inferences not justified by the actual wording of the booklets. Yet at the same time Appellants recognize that the booklets should be read in their entirety and wind up on page 94 with a claim that the pamphlets give "readers a false impression that Nutrilite would prevent or cure all but acute ailments—the very claim which their own Purchaser survey (R. 39-47) had disproved so emphatically when it reported as to customers and purchasers who bought Nutrilite after reading the pamphlet: "None of them thought that Nutrilite was a cure for anything but merely vitamins and minerals which would build their bodies up." Appellants do not mention this finding. All Appellants offer is arguments advanced by biased Appellants trying to justify their decisions against the pamphlets, not evidence as to the impression readers will ordinarily receive. If Appellants had anything to contradict the survey from their files offered by Appellee surely they would have offered it!! *Cf. Baltimore & Ohio R. Co.* v. *United States*, 298 U. S. 349, 381.

On pages 91 through 94 of their brief, Appellants list five "material representations" which are "clearly false" and state "such falsity was not contradicted by Appellee." Appellee takes issue with all these charges and Appellee did offer evidence showing the same *not* to be false. Ap-

pellants' first reference in this respect is to the quotation from a New York Times article. Appellants fail, however, to refer to Appellee's Exhibit 22 (R. 1058, 537) which is a copyrighted article on a New York Times dispatch in which is repeated word for word the statement in the booklet attributed to the New York Times. Appellants state that in its context it attributes the high rejection rate for women applying to the WAC to vitamin and mineral deficiencies. No such statement or inference is contained in the booklet, the article merely being put in to illustrate the point that we in the United States are not as healthy as we think we are. Appellants try to draw the same unjustified inference from the statements on page 6 concerning draftees in World War II (R. 235-237, 791, 852, 891).

With regard to the so-called Pennsylvania State Survey mentioned on page 4 of the booklets, the references in the booklet are clearly supported by the survey itself (R. 1225, 456-457)[102b] and also by *Appellants' own Exhibit 18* (R. 1249, 457). The statements by Appellants about Carl Rehnborg are totally unjustified by the record. The stipulation concerning Rehnborg does not in any sense contradict what is said in the booklet. The facts stipulated were not meant and were not considered by the Court as being a complete case history of Rehnborg's education and experience (R. 1542). Appellants wrote this partial outline of his life—it on its face is only a partial outline— and Appellee agreed to it in exchange for withdrawal of a subpoena served on Rehnborg so that he could go home to California under circumstances rebutting any possible inference such as Appellants now seek to draw from it (R. 518-520). By no reasonable interpretation could anyone say what Appellants now say, that such a partial statement of facts covers Rehnborg's whole schooling and experience. A fair

[102b] The "survey" (R. 1225-1247) which was offered by Appellants clearly recognized the widespread incidence of vitamin and mineral deficiencies. See particularly R. 1226-1231, 1243-1244.

reading of both will show that the facts in the stipulation do not contradict those in the pamphlet in any respect. (See R. 239-241.)

Appellants' reference to page 28 of the booklets (R. 913) clearly aborts and misstates the language of the booklet. The booklet does not state that deficiency diseases are those most responsible for death but only that "diet deficiencies may . . . . show itself as one of the common or not so common deficiency diseases, including those most responsible for death in our 40's and 50's." The references obviously are to deficiency diseases causing death in the 40's and 50's and not to other diseases.

It is interesting to note that in making all these most strained arguments never *once* do Appellants seek to find in the pamphlets the things they attribute to Butz in the findings they never did prove he signed.

Finally, on page 83 Appellants refer, as they do in most of the references they make to the 58 page pamphlet and say "the administrative officials" were entitled on the basis of things Appellants refer to in the 58 page pamphlet to conclude that the case histories which appear only in that pamphlet represent certain conclusions. Appellants neglect to say that the *only* administrative official having the 58 page pamphlet before him was Appellant Crawford who admittedly did not read it when he condemned it as misleading (R. 761), nor do Appellants refer to the fact that use of the 58 page pamphlet was discontinued *October 11, 1948*—a long time ago—as soon as it was questioned in the first libel seizure in Belleville, New Jersey (R. 161, 762-763). Nor do Appellants claim the references to the 58 page pamphlet are representations that Nutrilite will cure anything for they know the pamphlet says of the ailments there described "Nutrilite did not cure the ailment" (R. 825) and in other places it specifically says Nutrilite is *not* a cure (R. 785, 825, 837, 840-841). Also the pamphlet qualifies the case histories time and time again as for example:

"It should also be remembered that the cases described above were selected to show what happens where there is an *extreme* (underlined in original) nutritional deficiency . . ." (R. 837). Also, "In preparing this book for your reading, our primary purpose is to cause you to realize that the average or better than average civilized diet does not provide you with complete and adequate nourishment" (R. 840).[103] But we do not want to be guilty of lifting sentences out of context as Appellants are. Appellants know that purchasers and consumers who read the entire pamphlets gain no misleading impressions as that was the result of their purchaser survey cited above and that was the result when each of the three judges read the entire contents of each pamphlet (R. 182, 294). They just hope that by bringing this tremendous record here this Court will *not* have the time to read the pamphlets and will take their excerpts lifted out of context as a true picture of the pamphlets' contents.

Appellants know better than anyone else that if this Court reads the three pamphlets in their entirety Appellants' unfair twisting of their true meaning and intent will be rejected. If Appellants could have found one consumer to

[103] The case of *United States* v. *John J. Fulton Co.*, 33 F. (2d) 506 does not hold, as Judge Goldsborough points out at page 150 of the Record that where, as here, the case histories are preceded, surrounded, and followed by explanatory material they represent a product as a "cure." That purchasers and consumers did not understand these as such a representation, see *supra* pages 28-30, as it was the 58-page pamphlet they read. Appellants do not question that the case histories are authentic (R.380). The sworn affidavits of each person giving such a history were furnished to Appellants (R. 520). *Cf. Northam Warren Corp.* v. *Federal Trade Commission*, 59 F. (2d) 196 (CCA 2d). The Court did not stop cross-examination on this as Appellants claim (p. 84, Brief) but specifically told Appellant's Counsel "You can continue in it if you think there is any profit in it for you" (R. 152). The case histories in this pamphlet relate to good faith only as their use was discontinued immediately (18 months ago) when questioned and Appellants were so notified (R. 762-763). That action proves Appellee's good faith. See *supra* pp. 44-46.

back up their claims one can be sure he would have been presented as a witness at the trial, for as stated page 39 *supra* they surely spent enough time and money interrogating Appellee's customers hunting for that one, yet-to-be found customer or purchaser witness.

18. The Legislative History of the Act Does Not Sustain Appellants' Conventions—It Indicates a Contrary View

(a) Judicial Review of Arbitrary, Capricious and Oppressive Conduct not Intended to be Eliminated

Appellants argue (P. 58, brief) that the legislative history of the Federal Food, Drug and Cosmetic Act reveals a Congressional intent to eliminate judicial review of the administrative decisions required as a condition precedent to the institution of multiple seizures under the Act.

In support of this argument, Appellants cite the language of several of the earlier bills which were before Congress and which contained specific authority for executive seizures of certain defined articles and which also authorized "suits of the kind here involved." (P. 53, Brief). Appellants then cite the provisions of later bills and of the Act as enacted and because such bills and Act did not contain the specific provision authorizing courts to enjoin multiple seizures, Appellants conclude that Congress irrevocably and finally "rejected" their right to do so.

Appellants correctly state that S. 5 of the 74th Congress [104] was passed by the Senate in May, 1935, containing the following language in Section 702:

---

[104] Complete examination of the legislative history of the Federal Food, Drug and Cosmetic Act requires a study of the legislative progress of the following five bills, the last named of which, was enacted:

(1) S. 1944, 73rd Congress, 1st & 2d Sessions.
(2) S. 2000, 73rd Congress, 2d Session.
(3) S. 2800, 73rd Congress, 2d Session.
(4) S. 5, 74th Congress, 1st & 2d Sessions.
(5) S. 5, 75th Congress, 1st & 3rd Sessions.

"The District Courts of the United States are hereby vested with jurisdiction, on petition by any interested person . . . to grant appropriate injunctive relief from any act or omission of any officer, representative, or employee of the Department in the administration of this Act, if it has been shown that such act or omission is unreasonable, arbitrary, or capricious, in the light of the facts, or not in accordance with law, and that the petitioner may suffer substantial damage thereby . . ."[10]

And that this language was eliminated by the House Committee.

But Appellants fail to specify or account for the reason why this provision was omitted from later drafts of the bills and from the Act as enacted. Appellee asserts that there is an adequate and satisfactory explanation for the omission of this provision granting district courts jurisdiction to restrain the institution of multiple seizures and that this explanation is clearly revealed in the language of a report of the House Committee on Interstate and Foreign Commerce which, in reporting S. 5 of the 74th Congress to the House, eliminated the above quoted portion of Section 702 with the statement that a specific provision in the Act giving Courts jurisdiction to enjoin arbitrary, capricious and oppressive action was unnecessary because courts of equity and courts empowered to render declaratory judgments could protect against such action anyway. Appellants note the "elimination" but skip the report explaining why.

[10] See Senate Report No. 361, 74th Congress, 1st Session, where, with reference to this language, it was stated:

"This section likewise authorizes the courts to grant appropriate injunctive relief from any act or omission on the part of the Department or its officers, representatives, or employees in the administration of the act. The established rules of constitutional law governing judicial review of administrative action, as developed by the United States Supreme Court, would, of course, be applicable to proceedings under this section."

The Committee Report states:[106]

"The committee had several reasons for the omission of this section of the Senate bill. This section would have given to the district courts jurisdiction to restrain by injunction the enforcement of regulations, or to grant appropriate injunctive relief from any act or omission of the Secretary or his officers or employees, upon a showing that the regulation or the act or omission was unreasonable, arbitrary, or capricious, or not in accordance with the facts or law, and that the petitioner might suffer substantial damage by reason of the enforcement of the regulation or by reason of the act or omission. The committee was not aware of any precedent for such a provision. Insofar as it gave the court jurisdiction to decide whether the regulation, act, or omission was not in accordance with the facts, it was felt that this would constitute the imposition of a nonjudicial function upon the court. (See Federal Radio Commission v. General Electric Co., 281 U. S. 464.)[107] Aside from this consideration the court would have been authorized to grant the relief if the petitioner could show that he 'may suffer substantial damage.' This seemed to the committee to be a radical departure from the ordinary principles of equity under which relief may be granted where there is no adequate remedy at law and the complaining person can show that he will suffer irreparable injury.

"The committee felt that there was no reason to add to the existing remedies which are applicable in the case of administrative action under the many other acts passed by Congress. There is always an appro-

---

[106] House Report 2755, 74th Congress, 2d Session. See DUNN, FEDERAL FOOD DRUG AND COSMETIC ACT (1938) 556-557.

[107] Cf. *Nashville, Chattanooga & St. Louis Ry.* v. *Wallace*, 288 U. S. 249, 262; *Federal Radio Comm.* v. *Nelson Brothers Bond & Mortgage Co.*, 289 U. S. 266, 275; That the Federal Communications statute now restricts review to judicial questions see *Federal Communications* v. *Pottsville Broadcasting Co.*, 309 U. S. 134, 144. The requirement that the decision herein be based on "facts found" and the admitted absence of all facts is discussed *supra* page 51.

priate remedy in equity in cases where an administrative officer has exceeded his authority and there is no adequate remedy of law, and furthermore the committee is of the opinion that ample protection is given by the so-called Declaratory Judgments Act enacted on June 14, 1934, as section 274D of the Judicial Code (U.S.C., 1934 Ed., Title 28, Sec. 400). Insofar as the court would, under the Senate bill, have been empowered to give relief in case a regulation or an act of the Secretary was unreasonable, arbitrary, or capricious, or not in accordance with law, this is merely the ordinary principle which the court applies in cases where an administrative official has exceeded his authority, and a person affected by an administrative official's action may always, whether in a criminal proceeding, equity proceeding, or any other proceeding, raise these issues. The provision of the Judicial Code above referred to gives the courts jurisdiction in actual controversies to declare rights and other legal relations of any interested party, and such a declaration has the force and effect of a final judgment or decree and is reviewable as such. This provision of the Judicial Code would apply to all kinds of disputes arising between parties or arising under legislation, but as stated in the report of the Judiciary Committee when it reported out the measure, 'This form of preventive relief is distinguishable from curative relief in that the latter is incapable of redress until an injury has occurred or the contract broken.' The remedy furnished seems to be peculiarly adapted to cases where the interests and rights of parties are affected by the acts of administrative officials. . . . " (Underlining supplied.)

This, it is respectfully submitted, is the true reason why the Section was omitted and cannot, under any circumstances, be deemed to support Appellants' suggestion that Congress "rejected" the jurisdiction to enjoin the making of multiple seizures by arbitrary, capricious and oppressive action. Precisely the opposite is the case for the above in-

dicates a belief that it was unnecessary to spell out review provisions in the Act.[198]

(b) Words "Without Hearing" Slipped Into Bill in Last Conference Just Before Final Adoption and Probably Unknown to Most Members of Congress

Attention should be directed to the footnoted statement in Appellants' brief (P. 57-58, n. 35) as to statements made

---

[198] While not directly reflecting Congressional intent, the following statement, made by the then Chief of the Food and Drug Administration before a subcommittee of the Senate Commerce Committee which was conducting the initial hearings on S. 1944 of the 73rd Congress, the first of the bills which Congress was to consider is of interest. This statement followed a colloquy that pertained to the establishment of tolerances by the Secretary of Agriculture, and read as follows:

"Senator Copeland: Then it would not be merely an arbitrary establishment on the part of the Bureau of the degree of the tolerance?

"Mr. Campbell: Indeed no. Furthermore, the growers and others commercially interested would be heard.

"Senator Copeland: It would be done by scientific study and research?

"Mr. Campbell: Quite right, and I would like to say, that if there were to be an arbitrary determination which was capricious, quite naturally it could be overturned by an appeal to the court.

"Senator Copeland: Is such provision made in the bill? Is it clearly stated in the bill that there would be a possibility of such an appeal?

"Mr. Campbell: *That has not been definitely stated. That is not necessary.* Such a court review can always be had, Senator. There is no question whatever but that *the courts have the right to review every section of this law* and every regulation promulgated by the Secretary under the law. It is expected that that will be done; and if the action of the administrative agency has been found to be arbitrary, unreasonable, capricious, and not predicated upon evidence and upon facts, there is no question but what the courts will not sustain it. . . ." (Italics supplied.) Hearings Dec. 7, 8, 1933, p. 20.

This bill authorized multiple seizures. See *supra* pages 109-110 judicial review.

by Judge Clark in the trial below where he agreed with Appellee's Counsel that the words "without hearing" were "slipped" into the Federal Food, Drug and Cosmetic Act by the Conference Committee without their presence being known to most members of Congress (R. 679-680).[109] Appellants' themselves refer to these words as having been "inserted" by the Conference Report without explanation "presumably because its meaning and purpose were obvious" (p. 58). Appellee is quite well aware that this Court has only recently had occasion to reject a contention that the Congress knew not what it did and the foregoing is set forth with some little hesitation because of that fact. *Ex Parte Collett*, 337 U. S. 55, 72.

The Food, Drug and Cosmetic Act of 1938 was adopted after five years of Congressional consideration to replace the Food and Drugs Act of 1906. Senator Copeland introduced the original bill on June 12, 1933 (S. 1944, 73rd Cong. 1st Sess.). Of this Bill he later said:

> "I introduced it in June but did not read it until October . . . When I read the Bill I was shocked to think I had introduced a bill like that, giving arbitrary power to the Secretary of Agriculture."[110]

From 1933 to June, 1938 there were many varying bills introduced, many revisions and amendments were accepted or rejected, many committee and subcommittee hearings conducted, and many debates took place in the Senate and House of Representatives. This legislative history has been

---

[109] R. 679-680: "What Mr. Rhyne stated the other day over in Court is perfectly correct, that this language that you rely on in that statute was slipped in there. . . . I did (not) happen to be a member of the Conferees, and I was negligent, I freely admit, that I did not notice it in the Conference report. It was slipped in the Conference report and never intended to be there, neither in the Senate nor the House."

[110] 79 Cong. Record 5024.

considered in detail by this Court in other cases so is not repeated herein.[111]

Notwithstanding intensive consideration of the various drafts of the bills during this 5-year period, not a single draft contained the words which are used chiefly as a cloak for the actions of Appellants herein, i.e., "without hearing" or the phrase in a material respect misleading "to the injury or damage of the purchaser or consumer." There is not the slightest suggestion in the legislative history of this Act that such words were discussed prior to the report of the Conference Committee which reported the final draft of the Act.

The dates upon which the conferees were appointed, upon which the Conference Committee agreed on the final language, upon which their report was submitted, and upon which it was accepted are most revealing. On June 2 and 3, 1938, the Senate and House conferees, respectively, were appointed.[112] On June 10, 1938, the conferees agreed upon the manner in which the differences would be settled. On that same day the Senate adopted the Conference report.[113] It is reasonably certain many of the Senators, except possibly those on the Conference Committee, did not know of the existence of the new words "without hearing" in the bill as they probably did not see the text of the bill until it came out the next day in the Congressional Record as inserted (without reading it) by Senator Copeland at the time he asked for the vote approving it. On June 11, 1938, the Conference Report was submitted to the House of Representatives and on June 13, 1938, it was there accepted without any specific debate of the words "without hearing" and in a material respect misleading "to the injury or damage of the purchaser or consumer" which would have made

---

[111] *United States* v. *Dotterweich*, 320 U. S. 277, 282.

[112] 83 Cong. Rec. 7955, 8169.

[113] 83 Cong. Rec. 8731.

their presence in this long and complicated Bill certain to be known to the members of that body."[114]

Thus for the first and only time, so far as Appellee's research extends, the words "without hearing" were written into a Federal statute—and with no explanation anywhere of any reason for this insertion.

It should also be observed in connection with the appearance of these words in the report of the Conference Committee that neither the Senate nor the House versions of the measure which were passed by the 75th Congress and sent to Conference, or for that matter neither the versions which were before any of the previous Congresses, contained any language which remotely approached that which appeared in the Conference report for the first time. The legislative history reveals that the major debates did not take place on the Conference report of the 75th Congress—they took place upon the other Bills introduced in the respective houses of Congress, and which, as noted above, were silent as to this phraseology.

Perhaps of equal significance with this apparent afterthought of inserting the words quoted above is the fact that when the Conference Committee's report was presented to the Congress, not the slightest effort was made by the sponsors of the bill, or the conferees themselves, to explain their inclusion to the members of the two houses either in the report or on the floor of Congress and both houses speedily accepted the report.

It cannot be said with accuracy, therefore, that Congress had lent the same painstaking and careful deliberation to the inclusion of the words "without hearing" and the phrase in a material respect misleading "to the injury or damage of the purchaser or consumer" in setting up the statutory scheme as it had to the various other aspects of the Act. Such a contention is completely rejected by the significant silence of the legislative history of the Act re-

[114] 83 Cong. Rec. 9087, 9095-9101.

specting this particular verbiage, and the circumstances which surrounded its adoption.

We have the greatest respect for the able men who make up the Congress and find it hard to believe that they intended the result revealed by Appellants' actions herein. In view of the known fact that Federal agencies have an opportunity to influence drafts in conference, it seems reasonable to conclude that the words were inserted in a belief that it would be easier to administer the Act with the words "without hearing" inserted. Surely constitutional guarantees are not to be "compromised on the footing of convenience or necessity." *Ohio Bell Telephone Co.* v. *Public Utilities Commission*, 301 U. S. 292, 305.

19. "Nor Will We Go Upon Him, Nor Will We Send Upon Him, Unless . . . By the Law of the Land"

For more than 700 years the words quoted in the title have stood as a part of the cornerstone of the common law heritage guaranteeing free people against abuse by government officials. They come from the Magna Charta which was wrested in 1215 by a rebellious people from the tyrant King John as a bulwark against arbitrary, capricious and oppressive government. The full text bears repeating and is as follows:

> "No free man shall be taken, or imprisoned or disseized or outlawed, or exiled or in any wise destroyed; nor will we go upon him, nor send upon him, but by the lawful judgment of his peers or by the law of the land." [114a]

Down through the years many English kings have been forced to declare their adherence to the language of this Chapter of King John's "Charter of Liberties." [115]

[114a] 17 John. 1215 C 39. Translation by Bishop Stubbs, 1 Constitutional History of England, 577.

[115] McIlwain, *Due Process of Law in Magna Charta*, (1914), 14 Col. L. Rev. 27.

It seems appropriate here where Appellants have certainly *gone upon* Appellee and have *sent upon* Appellee that we recall some of the milestones of the development of due process of law as contained in the Bill of Rights to the Federal Constitution. This brief resort to history seems most appropriate as a prelude to the inquiry whether our Constitution permits Government officials like Appellants to "go upon" and "send upon" our people in the way Appellants have gone upon and sent upon Appellee under the facts herein.

Only a few highlights can be referred to without extensive recitation. Going directly to 1610 and *Dr. Bonham's* case, 8 Coke 107(a), one finds that great jurist holding that actions of the Parliament against "human right and reason" are void.[116] Later one finds the creation of the "Star Chamber" which exercised arbitrary power authorizing shocking oppression of the people in the name of the King. In 1629 came the Petition of Right under Charles I, and in 1641 the infamous Star Chamber was abolished.[117] In 1688-1689 the English Declaration and Bill of Rights were released. In 1690 John Locke published his *Second Treatise on Civil Government* denouncing "arbitrary power" and "arbitrary decrees" by government. This book was widely read by our forefathers and his ideas played a prominent part in the formulation of our Constitutional principles.

In 1775 our great Declaration of Independence denounced 21 separate acts of arbitrary government in no uncertain terms. In 1789 our Federal Constitution went into effect

---

[116] See also *Baggs* case, 11 Coke 93(b) 99(a) (1616) holding a decision depriving an alderman of the freedom of the city void under *Magna Charta* where ". . . they have proceeded against him without hearing his answer to what was objected, or that he was reasonably warned . . . such removal is against justice and right."

[117] See Plucknett, *A Concise History of the Common Law* (2d ed. 1936).

only after a definite promise was given that immediate action would be taken to guarantee our people against abusive governmental action. Distrust of excesses of governmental action were the direct cause of this promise, and without it the Constitution may not have been ratified.[118] In the First Congress Madison proposed the first 10 amendments containing our Bill of Rights and in 1791 these amendments were adopted and became effective to put into definite language this guarantee against arbitrary, capricious and oppressive action by government.

From the time of the adoption of the Constitution up until the adoption of the 14th Amendment in 1868 the due process clause of the Fifth Amendment was invoked infrequently by the courts.[119] In this Court one finds a few cases like *Bank* v. *Okely*, 4 Wheat. 235, in 1819 announcing (p. 244):

> ". . . the good sense of mankind has at length settled down to this: that (the words) 'due process of law' were intended to secure the individual from the arbitrary exercise of the powers of Government . . ."

Shortly after the 14th Amendment went into effect a veritable flood of litigation seeking to invalidate governmental action as a violation of due process of law began to reach the courts. Only a few landmarks will be cited: in 1872 in the *Slaughter House* cases *(Davidson* v. *New Orleans)* 96 U. S. 97, Bradley, J., in concurring said if gov-

---

Rev. 366 and 460; Corwin, *The Supreme Court and the Fourteenth Amendment* (1909), 7 Mich. L. Rev. 643.

[119] *West Virginia State Board of Education* v. *Barnette*, 319 U. S. 624, 636-637: "Without promise of a limiting Bill of Rights it is doubtful if our Constitution could have mustered enough strength to enable its ratification. To enforce those rights today is not to choose weak government over strong government."

ernmental action is ". . . found to be arbitrary, oppressive and unjust, it may be declared to be not 'due process of law' " page 107; in 1884 *Hurtado* v. *California*, 110 U. S. 516 (use of information instead of indictment). In the *Hurtado* case the Court said in part at page 531:

> "The concessions of Magna Charta were wrung from the king as guarantees against the oppressions and usurpations of his prerogative. 'It did not' enter the minds of the barons to provide security against their own body . . . by limiting the power of parliament. . . . Applied in England only as guards against executive usurpation and tyranny, here they have become bulwarks also against arbitrary legislation."

Down through the years there has been the use of the due process clause to protect substantive rights by inquiring into the reasonableness of legislative action under the "means and the end" and "real and substantial" relationship tests as applied to particular businesses, with the pendulum swinging first one way then the other.[120] *The cardinal principles guaranteeing fair treatment contained in procedural due process have, however, stood immutable.* It seems to be a fair interpretation of the more recent decisions of this Court that the emphasis is now upon procedural due process for "injustices flourish where procedural requirements are relaxed."[121] The instant case is certainly one of procedural due process.

The emphasis on procedural due process has carried over to the legislative branch of our National Government with the enactment of the Administrative Procedure Act in 1946 designed to guarantee that Governmental agencies treat

[121] Mr. Justice Douglas, *Procedural Safeguards in the Bill of Rights* (1948), 31 Am. Jud. Soc. J. 166-168.

our people fairly. This Court's recent decision giving a broad interpretation to that Act has certainly advised the administrative agencies that this Court will give full support to the Congressional intent. *Wong Yang Sung* v. *McGrath, supra.*

The whole world is now torn in a struggle over the principles underlying freedom of man and governmental control over man in his life, liberty and property. The latest bulwark in this development is the Human Rights Covenant where the word "arbitrarily" is used as a brake on governmental action since the term "due process of law" is not a term understood as a part of the law in other legal systems. Unfortunately the Covenant as presently proposed protects only life and liberty and omits "property"—the latter out of deference to the Soviet Government.

It is believed that Appellants' arbitrary, capricious and oppressive conduct in the instant case have offended the fundamental principles of justice thus deeply rooted in the traditions and conscience of our people. If the statutory provisions here involved are construed as authorizing such conduct it is respectfully submitted that it violates that fundamental fairness of treatment guaranteed by the due process clause.

20. In Absence of Emergency of Compelling Public Necessity Requiring Immediate Action, no Person may be Irremediably Deprived of His Property by Governmental Action Without a Hearing, If What Appellants Did is Authorized by the Statutory Words They Violate Due Process

Appellants in their brief (pp. 35-45) attempt to ascribe to the ruling of the lower court a basis which is completely unwarranted. This tactic is understandable inasmuch as they find the true basis of the ruling unassailable, a conclusion which is justified by their failure to refer to it in a single instance.

The basis of the lower court's ruling on the constitutional

issue is that where governmental action, by whatever name it is called, leads to irreparable injury, there should be an opportunity to be heard in advance of injury except where a great public necessity requires immediate action. It is this principle—as applied to the facts of this particular case—which this Honorable Court is now asked to reaffirm.

Appellants in their brief assume that Appellee's complaint is limited to the words "without hearing" rather than embracing all the conduct of Appellants herein, and then (p. 37) seek to further confuse the constitutional issue by *omitting* the first line of the Trial Court's Conclusions of Law, i. e., "The Court, upon the basis of the Findings of Fact herein, makes Conclusions of Law as follows: . . ." The conclusion that the provisions of Section 304(a) under which Appellants claim they acted is unconstitutional as in violation of the due process clause is based upon these Findings of Fact. And the position of the Trial Court simply stated is that when the words here involved are construed as authorizing what Appellants have done arbitrarily, capriciously and oppressively as set forth in the Findings of Fact herein, those words violate the due process clause.

Finding of Fact 42 of the Trial Court, *to which Appellants do not take exception in any way,* is as follows: (R. 770);

> "There was and is no emergency involving injury or damage of any kind to the public or to any purchaser, consumer or user of Nutrilite or in connection with Nutrilite and plaintiff's use of the three pamphlets which constitute defendants' sole objection to Nutrilite's sale. Defendants have not, at any time, indicated or contended that there is an emergency or situation of compelling public necessity with respect to the labeling of plaintiff's product and no such emergency or situation did, in fact, exist at or prior to any of the actions of defendants described herein."

The principle of law stated in the heading of this section is firmly established by the decisions of this Court and has been summarized as follows:

> "Where immediate action is necessary in the public interest, it is obvious that the parties cannot be heard before action is taken. When immediate action is not necessary, a hearing before action should clearly not be necessary where the action itself leads to no irreparable injury but leaves a later remedy which adequately protects all the rights of the parties. Where the initial action will itself lead to irreparable injury, there should be an opportunity to be heard in advance of action except where a great public interest requires immediate action. Otherwise, the remedy is not unlike that of a new trial in a capital case after the execution of the accused."

Dodd, Cases on Constitutional Law (1941), 894. Thus the manifest purpose of requiring a hearing "is to comply with the requirements of due process upon which the parties affected by the determination of an administrative body are entitled to insist." *Shields* v. *Utah Idaho Central R. R. Co.*, 305 U. S. 177, 182.

No special exigencies exist here which require that Appellants be denied their constitutional right to a hearing before irreparable injury is inflicted by invoking the statutory *exception* under which multiple seizures were authorized by Appellants. There was and is no emergency or situation of compelling public necessity making it impossible to take the time to give Appellee a fair opportunity to present its facts to the Administrator before his decisions that the ruinous onslaught of multiple seizures is to be authorized.

Absence of any facts justifying Appellants' actions herein is most significant. For as this Court said in *Gospel Army* v. *Los Angeles*, 331 U. S. 543, 548,

> ". . . experience demonstrates that particularly in constitutional cases, issues turn upon factual presentation."

Absence of justifying facts have been found fatal to interference with freedom of speech under a guarantee of equal status to that here invoked. *Bridges* v. *California*, 314

U. S. 252, 260-263.[121a] The facts herein have been fully considered *supra* pages 8-93 and are carefully set forth in the Findings of the Trial Court (R. 756-770) so they will not be restated here. The failure to read before decision, absence of facts on injury or damage and other facts which govern this constitutional question, have all been discussed herein and that discussion will not be repeated here. See *supra* pages 46-62.

The absence of any emergency is no more clearly and positively revealed than by the record of Appellants' own conduct in this case. Seizures were made in *seven* states only, in the period from October 6, 1948, until Appellants were restrained in this action, although Appellants had the names of Appellee's distributors and could have seized the product in 5,000 different places (R. 769-770). During that period the *alleged* "danger" to the public health went completely unabated in forty-one states. Moreover, even in those districts where the product was seized, other shipments were allowed to pass into the hands of purchasers before and after each seizure. Yes, Appellants were getting ready to make more seizures (R. 412, 769-777) to keep up the "pressure" on Appellee (R. 766-767) but such planned seizures were not for the purpose of protecting the public from any danger as the pressure memorandum does not mention any danger as its motivating purpose (R. 67).

In all cases involving summary seizure of property by or under the direction of governmental officials the courts have held such action a violation of due process in the absence of an emergency of compelling public interest requiring immediate action. Illustrative of this rule among state

---

[121a] If ever it is held, as Appellants seem to contend, that only the Appellants can interpret labeling and their opinions must be accepted as against the impressions of purchasers and consumers, see *supra* pages 28-30, we will have government imposed thought control which will lead to unlimited and uncontrolled censorship of free speech and press.

court decisions are: *Jenks* v. *Stump*, 41 Colo. 281, 93 P. 17; *Rowland* v. *State*, 129 Fla. 662, 176 So. 545; *Lacey* v. *Lemmons*, 22 N. M. 54, 159 P. 949; and *People* v. *Broad*, 216 Cal. 1, 12 P. (2d) 941.[122] In *Jenks* v. *Stump*, *supra*, at page 20 the Court said:

> "The distinction in all such cases seems to be whether public necessity demands summary action and, when it does not, notice must be given to the owner of the property and an opportunity be given to determine the truth of the allegations in each case, before the same is taken. . . . It does not appear from the record that any public necessity existed, nor that the public safety was in any manner conserved by taking these animals from the range or that any exigency existed which required them to be taken without notice to the owner and a hearing to determine whether or not they were abandoned or neglected, *nor does the statute purport to restrict the powers granted to cases of emergency.*" (Italics supplied.)[123]

In *Rowland* v. *State*, *supra* at page 547, the Court said:

> "We recognize the fact that the police power is a very broad one and that its exercise is necessary for the welfare of the community, but the right to exercise police power does not carry with it the unqualified right to destroy private property without due process of law. In emergencies such as those which are often caused by conflagrations, floods, windstorms, etc., it

(2d) 383; *Loesch* v. *Koehler*, 144 Ind. 278, 41 N. E. 326; *McConnell* v. *McKillip*, 71 Neb. 712, 99 N. W. 505; *People* v. *Marquis*, 291 Ill. 121, 125 N. E. 757; *Stockton* v. *Morris*, 172 Tenn. 197, 110 S. W. (2d) 480; *Shepard* v. *Giebel*, 110 S. W. (2d) 166 (Tex.); *Edson* v. *Crangle*, 62 Ohio St. 49, 56 N. E. 647.

[123] See *Missouri Pacific R. R. Co.* v. *Nebraska*, 217 U. S. 196, 207-208, invalidating a statute which had "no reference to special circumstances. It is universal in terms."

may become lawful to destroy private property without notice and without hearing for the protection of the public, and in such cases the right of the individual will yield to the right and for the benefit of the public at large, but in the normal and orderly course of events this necessity does not arise, and the rights of the citizen to the acquisition and enjoyment of property must be respected at least to the extent of giving him the right to be heard before his property is taken without compensation and without a hearing before some tribunal authorized to determine the necessity thereof."

In *People* v. *Broad*, *supra* at page 943, the Court said:

"The rule is well settled that to constitute due process of law in regard to the taking of property the statute *should give the parties interested some adequate remedy for the vindication of their rights;* and while it is a proper exercise of legislative power to provide for the destruction of property without notice when the public welfare demands summary action—instances of this being the power to destroy diseased meat or decayed fruit, to kill diseased cattle, or to destroy property kept in violation of law which is incapable of lawful use—nevertheless, where the property involved is what is sometimes termed innocent property, threatening no danger to the public welfare, the owner must be afforded an opportunity to be heard." (Italics supplied.)

In the instant case where *no* emergency or situation of compelling necessity exists or has ever existed [124] and where no facts whatever revealing complaints, injury [125] or damage are known to Appellants (with the only facts in Appellants' files to the exact contrary), [126] a situation of compel-

[124] *Cf.* the dissent of Mr. Justice Holmes concurred in by Mr. Justice Brandeis in *Leach* v. *Carlile*, 258 U. S. 138, 140.

[125] Findings 17, 29, 30, 35, R. 761, 765, 767.

[126] *Supra* page 28.

ling public interest necessitating immediate action before hearing is *not* shown. The claim that the Appellants' action must be accepted as conclusive proof of its own necessity, and must be accepted as in itself due process of law, has no support in the decisions of this Court. *Sterling* v. *Constantin*, 287 U. S. 378, 400.

It is Appellee's position that under the shocking facts of this case due process of law was not accorded to it and if it is found that the unusual provision herein attacked really authorized Appellants to do what they have done, Appellee submits that there is no other possible conclusion than that these few quoted statutory words *as applied to Appellee under the facts in this case*, violate the due process required by the Fifth Amendment for the taking of property by governmental action.

The constitutionality of this unusual use of multiple seizures has never been before this Court. The only Appellate Court to consider this type of action held that multiple seizures under much milder facts violated due process of law requirements. *National Remedy Co.* v. *Hyde*, 50 Fed. (2d) 1066 (D. C. App.).

These cases certainly adhere to the fundamental premise that in the absence of an emergency, a hearing before harm is essential to due process.

Appellants say (p. 38) their decisions are "merely the prerequisite to the bringing of a lawsuit." That statement is erroneous because they can bring one "lawsuit" without any such decision. It is only when they want to make multiple seizures after the *first* lawsuit that the decision is required. Appellants say that their seizures are via court process so are not summary in character. Such an argument substitutes fiction for fact. We ask the Court to pierce the veil of such fiction, as it has in so many other instances, and protect us from these seizures which are in fact summary. The cases are filed and seizure immediately takes place—the courts where the papers are filed make no

preliminary investigation to determine whether the suits are justified—5,000 suits could be filed in one day and no court on its own motion would do anything to stop them.

All of Appellants' argument about the decisions being mere recommendations (p. 47) is also an attempt to substitute fiction for fact. The Record shows they send the libel papers directly to the United States District Attorneys with a letter saying, "immediate seizure is requested" (R. 273, 413). The District Attorney does not have to write up anything, just file the papers and the seizure takes place as requested, "immediately." Judicial process is summary process under these circumstances where Appellants use such judicial process *ex parte* to punish us knowing full well only one of the many cases will be tried. In his dissenting opinion in *Springer* v. *Philippine Islands*, 277 U. S. 189, 211, Mr. Justice Holmes said "legislative and executive action" cannot be distinguished "with mathematical precision and divide the branches into watertight compartments." The same rule applies here. Appellee is protected under the Fifth Amendment from the unfair (and they say unstoppable) use of court process made here by Appellants. Appellants grand jury analogy is equally inapplicable, see *supra* page 74.

Appellants rely upon *Bowles* v. *Willingham*, 321 U. S. 503, where regulations and orders fixing rents were upheld although the statute provided that the rents were to go into effect at once and a hearing was to be given later. The Court stated at page 521 that this was "all that due process under the war emergency requires."

In the case of *Yakus* v. *United States*, 321 U. S. 414, also relied upon by Appellants, the Court in upholding emergency price controls and the denial of interlocutory relief pending a final decision on validity of the statute and regulations adopted thereunder said (P. 442):

> "our decisions leave no doubt that when justified by compelling public interest the legislature may author-

ize summary action subject to later judicial review of its validity . . ."

In both cases the Court *stresses the war emergency and compelling public interest again and again* a. he statutory requirements of expeditious handling of protests with specified time limits and a special emergency court doing nothing else but considering appeals. In the *Bowles* case at page 520 the Court said:

> ". . . Congress was dealing with the exigencies of wartime conditions and insistent demands of inflation control."

Also, in those cases the injury was really small (cf. *Lawton* v. *Steele*, 152 U. S. 133, 141) and had no lasting effects as compared with the stigmatizing publicity actions of Appellants on Appellee herein. In those cases no one person was singled out for "special" punishment in the way Appellee was in the instant case. A national war emergency affecting the whole Nation was involved. This is not true in the instant case as a narrow issue based on unique facts is involved.

Appellants cite *Phillips* v. *Commissioner*, 283 U. S. 589, as supporting non-emergency summary action by Government. In that case the particular taxpayers had a remedy which would give them a hearing before their property was taken and Mr. Justice Brandeis pointed out "this remedy may be had before payment, without giving bond" and that even on appeal "assessment and collection meanwhile may be stayed by giving bond to secure payment." Is it any wonder that the Court held (p. 599):

> "These provisions amply protect the transferee against improper administrative action."

Also, summary power to collect monies and taxes due to Government is one of the oldest rights of all governments —essential to their existence—and never thought to be

within due process proscriptions. *Cf. Murray's Lessee* v. *Hoboken Land and Improvement Co.*, 18 How. 272. In the instant case there is no way Appellee can give bond to stop the multiple seizures and Appellee's property is taken immediately as no District Court has authority to refuse the use of its process to Appellants in making the seizures. The *Phillips* decision does contain a statement much relied upon by Appellants which is as follows (pp. 596-597):

> "Where only property rights are involved, mere postponement of the judicial inquiry is not a denial of due process *if the opportunity given for the ultimate judicial determination of the liability is adequate.*" (Italics supplied.)

Appellants emphasize the first part of the sentence *only* but Mr. Justice Brandeis certainly intended both parts as the complete rule of law he was stating. In Appellee's case more than the value of the product actually seized is involved, Appellee's reputation, good will, and the reputation and good will of its product have received terrific irreparable injury from the punishing publicity of the carefully planned strategy of Appellants in making seizures in far flung places throughout the Nation. The trial in libel courts, as is discussed *supra* pages 93-105, is not an adequate remedy so the *Phillips* decision is not helpful to Appellants in defending against their arbitrary, oppressive and capricious action in this case.

The *Phillips* case cites and relies upon *Murray's Lessee* v. *Hoboken Land and Improvement Co., supra,* where the peculiar relationship of a Collector of Internal Revenue to his government was held to authorize the taking over of certain property of a collector delinquent in his accounts. In the *Hoboken* case, however, it is pointed out that under the remedies available to the collector a hearing could be had before the actual taking of the property in question. Mr. Justice Brandeis in the *Phillips* case says of the *Hoboken* case, "the underlying principle of that case was . . .

the need of the government promptly to secure its revenues" (p. 596).

The twelve cases cited by Appellant at the bottom of page 40 of its brief uniformly involve facts showing that the complaining party *in every instance* had an opportunity for a hearing before harm could come to him in any way. Those cases are not in point with the facts of the instant case for in those cases as in the rent, price, contract renegotiation and tax cases cited by Appellants there was a later hearing on the *very issue preliminarily determined.* Here there is never a hearing under the statute, if the court construes Appellants' actions as authorized thereby and adopts Appellant's construction thereof, on whether the Appellee's labeling was "in a material respect" misleading to the "injury or damage of the purchaser or consumer"—the issue in the 6 decisions authorizing multiple seizures. The later hearing Appellants want us to have under the Act in the libel courts would never involve an inquiry into Appellants' arbitrary, capricious and oppressive conduct in authorizing and using multiple seizures herein. The issue in the libel courts is solely whether our labeling is "misleading in any particular" (Sec. 301 of Act). On the issues before Appellants in making their six decisions authorizing multiple seizures, Appellants say no hearing can ever be held. Their conduct—they say—is beyond inquiry. But their cited cases do not hold this.

The interesting thing about Appellants' brief is its careful avoidance of a discussion of cases where this Court has considered due process and summary action under the police power. In *North American Cold Storage Company* v. *City of Chicago,* 211 U. S. 306 (cited only in a quotation from another case, p. 44, Appellants' brief), summary seizure of allegedly putrid, decayed, poisonous and infected poultry was sustained. The Court said at page 315:

> "We are of the opinion, however, that provision for a hearing before seizure and condemnation and destruction of food which is unwholesome and unfit for

use, is not necessary. The right to so seize is based upon the right and duty of the State to protect and guard, as far as possible, the lives and health of its inhabitants, and that it is proper to provide that food which is unfit for human consumption should be summarily seized and destroyed to prevent the danger which would arise from eating it. The right to so seize and destroy is, of course, based upon the fact that the food is not fit to be eaten."

The Court concluded at page 320:

"As the owner of the food or its custodian is amply protected against the party seizing the food, who must in a subsequent action against him show as a fact that it was within the statute, we think that due process of law is not denied the owner or custodian by the destruction of the food . . . without a preliminary hearing."

Appellee of course has no such remedy of subsequent action for damages and advertising pamphlets used in the sale of 40% of Appellee's product (Finding 3, R. 757; Finding 42, R. 770) rather than putrid chickens are the subject matter of the instant case. The *Chicago* case offers no comfort to Appellants.

In the case of *Lawton* v. *Steele, supra,* the Court in a 6-3 decision sustained denial of recovery for the value of fish nets summarily destroyed *while admittedly being used in violation of a New York Statute.* The court based its decision upon the ground that the fish nets in question were "of trifling value" and said at p. 141 that the constitutional due process provisions "are intended for the protection of substantial rights of property." In his dissent Mr. Chief Justice Fuller in an opinion concurred in by Justices Field and Brewer said in part at page 144:

"The police power rests, upon necessity and the right of self-protection, but private property cannot be arbitrarily invaded under the mere guise of police regulation, nor forfeited for the alleged violation of

law by its owner, nor destroyed by way of penalty inflicted upon him, without opportunity to be heard."

In *Sentell* v. *New Orleans & Carrollton Railroad Co.*, 166 U. S. 698, in sustaining an ordinance declaring dogs are not property, the Court said in part at page 705:

> "So far as property is inoffensive or harmless, it can only be condemned or destroyed by legal proceedings, with due notice to the owner; but so far as it is dangerous to the safety or health of the community, due process of law may authorize its summary destruction."

The summary seizure decisions of this Court have therefore stated that in the absence of an emergency or a situation of compelling public necessity the due process clause requires a hearing before harm by governmental action.

In considering due process in non-emergency cases, and the instant case is certainly not an emergency case, this Court has laid down fundamental principles of procedural fairness which this statute violates if it authorizes Appellants actions herein. In *Turner* v. *Wade*, 254 U. S. 64 a Georgia statute allowed *ex parte* assessment of property. An appeal to a board of arbitration was allowed with one arbitrator to be appointed by the taxpayer, one by the Assessment Board and a third by the two so selected. If a majority of the arbitrators did not agree on a new assessment in ten days the assessment was to stand. The arbitrators agreed the assessment was excessive but could not agree upon a new assessment before the ten days expired. In holding the Act invalid because of this abortive inadequate remedy the Court said at page 70:

> ". . . we are forced to the conclusion that reading the provisions together, being parts of one and the same act, they clearly show that the Board of Assessors was not required to give any notice to the taxpayer, nor was the opportunity given him to be heard as of right before the assessment was finally made against him.

> But provision was made for notice of the assessment to the taxpayer after it was made, and in event of his dissatisfaction the arbitration was to afford a hearing to him. Such hearing was all that the statute contemplated that the taxpayer should have.
>
> . . . it follows that the assessment of the Board of Assessors ought to have been enjoined, because § 6 of the act, as construed and applied in this case, denies to the complaining taxpayer due process of law."

The hearing must always be held in time to be effective and it is a violation of due process if there is not an effective stay to prevent irreparable injury until the final decision. In the instant case it is obvious that unless a court can stop Appellants they are unstoppable as the statute provides no stay of further multiple seizures and the statutory remedy in the libel courts is clearly inadequate. (See *supra* pages 93-105.)

In *Southern Railway Co.* v. *Virginia*, 290 U. S. 190, a statute of Virginia authorized the *state highway commissioner* to require railroad companies to eliminate grade crossings and to substitute overhead crossings when "in his opinion" this was deemed necessary for the public safety and convenience. No notice or hearing on the existence of such necessity and no means of reviewing the officer's decision was set up in the statute. The Court held the statute unconstitutional as violative of the due process of law clause of the 14th Amendment, saying (p. 195):

> ". . . it (the statute) attempts to give an administrative officer power to make final determination in respect of facts—the character of a crossing and what is necessary for the public safety and convenience—without notice, without hearing, without evidence; and upon this *ex parte* finding, not subject to general review, to ordain that expenditures shall be made for erecting a new structure."

See also *Coe* v. *Armour Fertilizer Works*, 237 U. S. 413; *Chicago, Milwaukee & St. Paul Ry. Co.* v. *Minnesota*, 134

U. S. 418; *Central of Georgia Railway Co.* v. *Wright*, 207 U. S. 127; *Missouri Pacific Ry. Co.* v. *Nebraska*, 217 U. S. 196; and *Londoner* v. *Denver*, 210 U. S. 373.

The one overwhelming conclusion from all of the cases decided by this Court is that due process varies according to the factual situation before a governmental official—does he have a tax, an immigration, or an emergency public health situation requiring him to act? That is why it is all important that the facts surrounding a constitutional due process issue such as the one presented by this case be fully developed by evidence so that the Court can act in an informed manner.[127]

It is a fair conclusion from the decisions of this Court above cited that in the absence of an emergency of compelling public necessity a hearing before harm is essential to due process. Under the facts of the instant case no emergency of that character exists so if the acts of Appellants are in fact authorized by the words here attacked, those words violate that due process of law guaranteed by the due process clause of the Fifth Amendment.

Also, aside from the absence of an emergency, the decisions of this Court have never held that the arbitrary, capricious and oppressive conduct herein found to have been done by Appellants is due process of law.[128]

21. Errors Claimed by Appellants on Conduct of Trial, Admission of Evidence and Requiring Production of Documents, if Any, Do Not Warrant Reversal

They who denied us any hearing in most arbitrary fashion, now say that the Trial Court which gave them most of its time for nearly two weeks did not give them a fair hearing because of certain rulings, none of which affected the

[127] See cases cited *supra* note 5.

[128] We have not repeated herein the discussion *supra* pages 46-62, 81-93 on Appellants actions as a violation of due process, aside from the emergency.

ultimate result in this case. Appellee respectfully submits that an examination of the record herein reveals that error, if any, committed by the Court below was harmless and not such that the substantial rights of Appellants were prejudiced.

Much is sought to be made of the exercise of the discretion of the Court below in limiting the cross-examination of Dr. John A. Myers. On the contrary the record reveals that Appellants' cross-examination of Dr. John A. Myers was not limited until he had been under cross-examination for over five hours (his direct examination took about 50 minutes). During this time, counsel for Appellants not only covered the entire scope of Dr. Myers' direct examination but insisted upon going far-afield (see Record 92-183) and indulging in highly repetitious questioning, despite repeated warnings from the Court. It is evident in the record that the main purpose of the cross-examination was not only to exhaust a witness of unimpeachable professional standing but also to exhaust the patience of the Trial Court. The limitation of the cross-examination was within the sound discretion of the trial court and merits scant attention here. See *Glasser* v. *United States*, 315 U. S. 60, 83. Appellee would like to point out, however, that Appellants misstate the entire testimony of Dr. Myers. Dr. Myers did *not* testify that deficiency diseases did not cause death in the 40's and 50's. On the contrary, Dr. Myers testified that vitamin and mineral deficiencies were serious in the 40's and 50's and were responsible for cardiac collapse and sudden death (R. 133-134). The whole import of Dr. Myers' testimony was the need of an adequate supply of vitamins and minerals in order for the proper functioning of the body and to avoid the serious and widespread conditions which may follow deficiencies (R. 72-91). All the cross examination on all the "common diseases" and "common illnesses" and cures therefor referred to by Appellants had nothing to do with the pamphlets as

Dr. Myers said, in line with all the other credible testimony in the case, that Nutrilite is not represented in the pamphlets as a "cure" for any disease (R. 87).

Appellants' contentions regarding the limitation of cross-examination of Casselberry are also without merit. At no stage in his testimony did Casselberry testify that the booklets were not misleading. The quote given by Appellants on page 101 is erroneous as by now the Court can see so many of their references are. His only testimony as to the character of the booklets was to the effect that there is nothing in the booklet now used which he believed to be untrue (R. 51-52). For that matter no reason exists why he could not have given his opinion for what it is worth on whether the pamphlets were misleading. There can be no doubt what his opinion would be if given. He is a very well educated man (R. 32). And none of Appellants who gave such opinions are any better qualified than he to give such an opinion.

As for Appellants' so-called "offer of proof" it is evident from the remarks of the Court below and referred to by Appellants that the offer contained 77 questions. None of the questions said anything about the answer expected, and since the questions were to Appellee's President it can hardly be expected that the answers would be favorable to Appellants. In *Origet* v. *Hedden*, 185 U. S. 228, 235, the Court rejected a similar claim of error where there was "no explanation in the record as to what evidence plaintiff (Appellants) sought to elicit. No offer of proof was made, nor did the questions clearly admit of an answer favorable to plaintiff (Appellant) . . ." Also, the questions did not contain in most instances the type of question to which objections had been sustained previously, as the Court points out (R. 520-528). This was presented on the very eve of the close of the trial and a *week* after Counsel for Appellants had advised the court that he would embody the questions he proposed in an offer of proof. Needless to say, the offer

contained questions which were not of the type previously ruled upon by the Court below and represented questions that could have been asked Casselberry while he was on the stand. For the most part such offer was a collection of afterthoughts. It should be noted also that Appellants failed to make this offer of proof part of the record as they could have easily done by having it marked as an exhibit. Not being part of the record, it should not be considered on this appeal. *Cf. Palmer* v. *Hoffman*, 318 U. S. 109, 116.

Also, as Appellant's brief recognizes, the record clearly shows that all the Court ruled against was argumentative questions (R. 229-230, 232, which are not allowed in any Court. The "offer of Proof" was Appellants' Counsel's *own idea* (R. 232) not that of the Court, and the Court did *not* suggest it be in the form of questions without stating the answers Appellents expected to get. Yet, that is exactly what Appellant's offered (R. 520-528). The record shows that Appellants cross-examined Casselberry at great length (R. 183-222, 225-246) and said "no further questions" and does *not* show Casselberry was present when Appellants asked for permission to recall him to the stand for further cross-examination.

Appellants urge as error (p. 108 Brief) the action of "the court" in denying their motion to quash subpoenas *duces tecum*. Although Appellee believes no error was committed below in regard to the denial of the motion to quash, it believes an answer to Appellants' argument to be unnecessary in view of the fact that the motion was heard and denied by a single judge and at no time did Appellants seek to have his action reviewed by the full court. Section 2284, Title 28, USC which sets forth the composition and procedure before a special three-judge district court specifically provides in subsection 4:

> "The action of a single judge shall be reviewable by the full court at any time before final hearing."

Appellants failure to seek review of such order, if they deemed themselves prejudiced thereby, precludes their reliance upon it here. In no sense should denial of Appellant's motion to quash be considered action by the full Court. *Cf. Tapliff* v. *Tapliff*, 145 U. S. 156.

The refusal to quash subpoenas requiring Appellants to testify (see p. 108-109 of Appellant's brief) is of like status. They did not appeal the single judge's ruling to the full Court. Also, in reading in Kingsley's deposition which is the only place such an objection appears in the record, Appellant's expressly and specifically waived this and all the other objections they made of this character (R. 506-508). They can hardly rely now upon objections thus expressly waived.

In reply to the assigned error as to the rejection by the court below of Defendants' Exhibit 26 (Brief p. 103), Appellee submits that the offered evidence was totally irrelevant and immaterial to the issues involved. Appellee does not claim or assert that vitamin and mineral deficiencies *as such* are primary causes of death in any group. Appellee does contend, however, as supported by the medical testimony below, that vitamin and mineral deficiencies are significant in the incidence of diseases since those who receive sufficient vitamins and minerals are naturally better able to resist sickness (R. 133-134, 137-139, 362). Defendants' Exhibit 26 was further objectionable on the ground that it was hearsay. While there may not have been any reason for those who compiled the publication to falsify, the death reports themselves do not seem to have any special guaranty of reliability to take a compilation of the same out of the hearsay rule. It is obvious that in many instances those reporting the causes of death are incompetent from a professional viewpoint to diagnose the same and they merely follow a questionable form in listing causes (R. 139, 141). In other instances, there may well have been reason to falsify. Appellants offered no evidence to con-

tradict Dr. Myers' testimony that death report forms from which Exhibit No. 26 was compiled are not a reliable source on causes of death (R. 139-141). The offered exhibit was also merely cumulative and error, if any, in rejecting the same was not prejudicial. (See Defendants' Exhibit 25, R. 1543-1561, 529).

Appellants also assign as error (p. 104) the rejection of a medical publication entitled "Deficiency Diseases in the Cincinnati Hospital—A Ten Year Study" offered through its author, M. A. Blankenhorn (R. 425). It should be pointed out that this article was offered for the *truth* of its contents (R. 426). Yet the author testified that the report was not based on his personal investigations or knowledge (R. 425, 428). Appellants' objection to the same as hearsay was thus properly sustained (R. 425-426). Furthermore, it should be pointed out that Blankenhorn subsequently testified to the results which were the basis for the offered study (R. 428-429). Thus, the exclusion, even if erroneous, should not be grounds for reversal where the contents of such evidence are proved by other testimony. *Matheson* v. *United States*, 227 U. S. 540; *Drumm-Flato Commission* v. *Edmisson*, 208 U. S. 534. Appellant's claim this ruling is inconsistent with the admission "not to show the truth of it but to show our entire good faith in that our pamphlets and these books say the same thing" of Appellee's Exhibit No. 6 (R. 957-979, 50). Exhibit 6 contains statements by the experts in the field of vitamins and minerals on some of which Appellee relied in writing its pamphlets (R. 217) and unlike Defendants' exhibit it was not offered to prove the truth of facts but only on the issue of good faith to show the existence of such literature.

Appellants also seek reversal on the basis of certain evidence offered by Appellee and admitted by the Court. In one instance referred to on page 102-103 the Appellants' statement contains its own death knell because the objection was one that could obviously have been corrected if the

objection had been made when the deposition was taken.[129] Obviously Appellants are again misstating the Record because at pages 259 and 260 the Court three times sustained objections made by Appellants during the reading in Court of the very deposition to which objections had not been made when the deposition was given. The Appellant's claim of error (pp. 105, 106) in receiving opinions on the impression of the booklet on the consuming public is without merit. Dr. Myers testified only as to his impression as a medical doctor (R. 85). Lee J. Myers testified only as to his legal opinion (R. 528). Crawford most certainly was allowed to put into evidence his opinion that the pamphlet is or would be misleading in a material respect to the injury or damage of the purchaser or consumer (R. 333). The Court would not let him give medical opinions or symptoms as he is not a doctor, but that is all he was stopped from doing (R. 382-383).

The other assignments of error are so lacking in merit on the Record herein and so obviously a misstatement of the Record as not to warrant discussion.

Appellee submits that in view of the fact that this case was tried by a court and not by a jury, the strict rules regarding prejudicial evidence are not applicable. This Court has often stressed that where a district court decides both the facts and the law, the admission of improper evidence is not ground for reversal where there is sufficient other evidence upon which to base the decision. *Field* v. *United States,* 34 U. S. 182 and *Mammouth Mining Co.* v. *Salt Lake Foundry & Machine Co.,* 151 U. S. 447.

Appellants, throughout their discussion of the alleged errors committed below, have not carried the burden of showing that prejudice resulted or that the substantial rights of Appellants were affected—even if it be assumed

[129] Appellant's failure in this regard is important since such objections could have been obviated during the course of the deposition. See Rule 32(c)(1) of the Federal Rules of Civil Procedure.

that the rulings were erroneous. At most the errors, if any, were "harmless" and not grounds for reversal. 40 Stat. 1181, c. 48, 28 U.S.C. § 391 and *Palmer* v. *Hoffman, supra,* at page 116.

As noted by this Court in *Glasser* v. *United States, supra,* this Court should guard against magnification of events and occurrences which were of little importance in the actual setting of the trial below.

22. Conclusion

For the above reasons the judgment below should be affirmed.

Respectfully submitted,

OSCAR R. EWING, FEDERAL SECURITY ADMINISTRATOR, ET AL.,

Appellants,

vs.

MYTINGER & CASSELBERRY

APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

STATEMENT OF APPELLEE ON APPELLANTS' JURISDICTIONAL STATEMENT

CHARLES S. RHYNE,
LESTER L. LEV,
Counsel for Appellee.

IN THE UNITED STATES DISTRICT COURT FOR THE DISTRICT OF COLUMBIA

Civil Action No. 5208-48

MYTINGER & CASSELBERRY,

Plaintiff,

vs.

OSCAR R. EWING, ET AL.,

Defendants

STATEMENT OF APPELLEE ON APPELLANTS' JURISDICTIONAL STATEMENT

While Appellee has no desire to oppose jurisdiction herein, it believes the Court's attention should be specifically called to the existence of inaccurate factual statements by the Appellants in their "Statement as to Jurisdiction". These inaccuracies are revealed by the Special Three-Judge Court's comprehensive "Findings of Fact" and the record herein. Appellee assumes that the proper place to detail these inaccuracies will be in its brief if the Court takes jurisdiction herein, but did not want this Honorable Court to conclude that it concurred in Appellant's statements by silence at this time.

Certain references to the Decision of the Special Three-Judge Court are also inaccurate and highly prejudicial in that they attempt to inject public health considerations

which are non-existent in this case. For example, on page 2 of their Statement, in quoting Section 304(a) of the Food, Drug and Cosmetic Act, the Appellants say the principal questions presented include constitutionality of certain quoted language. In this language they include provisions relating to the right to make multiple seizures of articles "dangerous to health" and those having "fraudulent" labeling. On page 9 Appellants refer to "dangerous articles", "fraudulent articles" and "seriously misleading articles" and on page 13 Appellants refer to "dangerous product", "fraudulent product" or a "materially misleading product" evidently hoping the Court will conclude that this case involves such facts. By their answer to Paragraph 17 of the Complaint Appellants specifically admitted that:

> ". . . Nutrilite Food Supplement is not dangerous to health and that the labeling and advertising thereof is not and never has been fraudulent . . . ."

The only part of the statute invalidated as applied to Appellee under the facts herein is the specific statutory *exception* to the statutory prohibition against more than one seizure, which exception allows more than one seizure in those cases where the Administrator determines that he has probable cause to believe that "labeling" is misleading to the injury or damage of the purchaser or consumer. The decision in this case does not involve the power of Appellants to make *unlimited* seizures of "dangerous products" or articles, or *unlimited* seizures of "fraudulent products" or articles with "fraudulent" labeling as no such facts are involved.

The disproved "misleading" charge related solely to Appellee's advertising pamphlet, and not to the "article" or "product".

Appellants suggest summary disposition rather than full consideration of their appeal. This suggestion is made in an evident hope of preventing this Honorable Court from fully appreciating and inquiring into the shocking actions of Appellants as revealed by the record herein which so amply supports the Court's Findings. It is believed that this is a case where the whole truth should be brought before the Court by proper briefs and argument. The argument before this Honorable Court on May 16, 1949, related to the right of the trial court to receive evidence on the merits and did not relate to the merits of either the issue on arbitrary, capricious and oppressive conduct of Appellants or the issue on constitutionality of the invalidated provisions as applied to Appellees. The facts were not before the Court, and this Court allowed a trial so that the facts could be fully developed. Now the facts have been fully proved and these issues can for the first time be presented in briefs and arguments. Actually, Appellants have no merit in their contentions, and that is the reason they again seek to avoid a full exploration of the merits by this Court.

Respectfully submitted,

CHARLES S. RHYNE,
LESTER L. LEV,
Attorneys for Appellee.

IN THE

Supreme Court of the United States

OCTOBER TERM, 1949

No. 568

OSCAR R. EWING, Federal Security Administrator, ET AL.,
Appellants-Respondents,

v.

MYTINGER & CASSELBERRY, INC.,
Appellee-Petitioner

PETITION FOR REHEARING.

Now comes Mytinger and Casselberry, Inc., and prays that this Honorable Court grant it a rehearing in the above entitled case for the following reasons:

1. Under the Majority Opinion Discretion May Be Abused With Impunity; the Act May Be Enforced With Caprice; a Lawful Business May Be Arbitrarily Destroyed; and a Court of Equity Is Prohibited From Preventing the Wrong.

The Majority Opinion vests final responsibility for multiple seizures under the Food, Drug and Cosmetic Act in the Attorney General of the United States. It holds such seizures can be made in his "discretion" and recognizes that this discretion "may be abused." This "discretion" is found in the general powers of the Attorney General to in-

stitute litigation in the name of the United States and is not found in the Food, Drug and Cosmetic Act. The Opinion refers to the statutory "prerequisite" which Congress has prescribed for the filing of multiple seizure actions but holds in effect that a Court of equity cannot stop the Attorney General and his co-respondents from violating this Congressional mandate no matter how grossly he abuses his "discretion" thus conferred and thus supposedly limited by the Congress. These unusual statutory provisions and the unique facts herein sets this case apart from all others, but the majority of the Court gives no consideration to these factors or to the consequences of its decision in placing in the hands of Respondents an uncontrollable destructive power unparalleled in the history of this Nation.

The Opinion stops short of considering the Findings of Fact of the Court below that the Attorney General has inflicted and threatens further irreparable injury upon Petitioner by arbitrary, capricious, oppressive and unlawful action. The lower Court found that the Attorney General and his co-respondents filed seizure actions in a carefully calculated nation-wide plan for punishment purposes (R. 763-764, 768-769) and that they threaten further punishment through seizures designed to destroy Petitioner's "business prior to any possible adjudication of the disputed issues. . . in any of the libel actions." (R. 769-770). The Opinion does not disagree with said Findings of Fact but holds the lower Court without power to lend its aid to rectify or prevent the wrong.

It is most respectfully urged that the Attorney General cannot usurp power to inflict irreparable injury through a gross abuse of his general discretion in the unusual statutory and factual circumstances of this case. In all the annals of Government there has never been carried out such a shocking contempt for all fundamental principles of fairness as is revealed in the record and findings herein. It is submitted that the Respondents do not have unstoppable power to inflict irreparable injury and damage and that a

Court of equity can use its inherent powers to fashion a remedy[1] which will protect against the administrative tyranny found by the Trial Court in this unusual case.

Even Counsel for the Attorney General believed that the Trial Court possessed the necessary power to prevent irreparable injury from arbitrary action for he repeatedly advised that Court that "... if the Defendants did act unreasonably and arbitrarily, they should be enjoined, we admit that ..." (R. 292) "The Court must then decide ... whether these defendants acted so arbitrarily, so capriciously, so whimsically, that a rational person just couldn't have reached that conclusion. That is the issue in this case." (R. 555) "The whole case is based upon the proposition, outside of constitutionality, that in doing what he did this defendant and the other defendants acted arbitrarily and illegally." (R. 382) There are other such statements by Counsel for the Attorney General in the Record. (R. 7, 9, 10, 26, 27, 90, 122, 123, 268, 294, 295).

Respondents in their Briefs below and in this Honorable Court contended that the District Court had no jurisdiction to review the determinations of probable cause herein and no jurisdiction to determine whether Petitioner's labeling is misleading—but never in their briefs do Respondents change their position on jurisdiction of the District Court to stop irreparable injury from arbitrary abuse of discretion. They apparently agree that there is a distinction between a statutory review and the traditional powers of a

[1] As Mr. Justice Douglas recently said for this Court: "We are dealing here with the requirements of equity practice with a background of several hundred years of history ... The essence of equity jurisdiction has been the power of the Chancellor to do equity and to mould each decree to the necessities of the particular case. Flexibility rather than rigidity has distinguished it. The qualities of mercy and practicality have made equity the instrument for nice adjustment and reconciliation between the public interest and private needs as well as between competing private claims. We do not believe that such a major departure from that long tradition as is here proposed should be lightly implied." *Hecht Company* v. *Bowles*, 321 U. S. 321, 329-330.

Court of equity to grant relief against irreparable injury when arbitrary action is fully proved.

True it is that in his reply argument in this Court, Counsel for the Attorney General in response to a question from the Court reluctantly—very reluctantly—took the position that no matter how arbitrary Respondents were they could not be stopped by any Court. This reluctance shows how abhorrent and unpalatable it is for any lawyer trained in the fundamental principles of fairness inherent in our Bill of Rights to take such a distasteful position.

Even the Congress, when considering the Act involved here, was of opinion that injury from arbitrary action could always be prevented by a Court of equity because in eliminating judicial review of any "act of the Secretary" of Agriculture, (the then chief enforcing officer of the statute) which was "unreasonable, arbitrary, or capricious", the Congressional Committee considering the legislation which became the Act here in question specifically pointed to the "ordinary principle" that this provision was unnecessary because "There is always an appropriate remedy in equity in cases where an administrative officer has exceeded his authority . . ." (House Rept. 2755, 74th Cong. 2nd Sess.).

Obviously the lower Court considered that its traditional equity powers were adequate to prevent arbitrary injury by the Attorney General and his co-respondents, that use of such powers had not been denied by the Congress in such cases, and further that the Administrative Procedure Act[2] removed all possible jurisdictional gaps in enabling the courts to prevent the threatened irreparable injury from the gross abuse of discretion such as found herein.

---

[2] 60 Stat. 237; 5 U. S. C. § 1001 *et seq.*; § 1009(e) specifically confers jurisdiction on district courts to prevent injury from "abuse of discretion". It is popular among all Federal agencies to contend this Act does not apply to them but it would be shocking that an Attorney General would claim authority to inflict irreparable injury by arbitrary abuse of discretion and unbelievable that the Congress would not have intended to confer power to give relief when facts such as those found herein are proved by evidence which was largely undisputed.

Under the findings of fact in this case, it is no answer to say that it must be assumed that the administrative officials will act within the proper bounds of discretion. Those Findings, unquestioned by the Majority Opinion, disclose that Respondents have acted arbitrarily and capriciously and not as reasonable men nor as reasonable public officials. While the Majority Opinion authorizes a review of the Administrator's probable cause determinations in the libel courts, it offers no forum in which the Attorney General can be challenged. There should be some Court where even the Attorney General can be stopped from such outrageous abuse and usurpation of power as found herein. The Majority Opinion fails to distinguish review of administrative action provided by statute from the inherent power of courts of equity to inquire into and enjoin unlawful administrative conduct resulting in irreparable injury and multiplicity of unnecessary litigation—a power the existence of which the Congress considered so fundamental that it did not consider it necessary to expressly include such jurisdiction in the Act.

The record shows the Attorney General has been an active participant herein from the beginning of the multiple seizures, so he is, as the final authority, responsible for all the arbitrary actions found by the Trial Court.[3]

An opportunity is now most respectfully requested to present a brief and argument in support of the position that under the unique statutory prerequisites and facts of this case the trial Court was not powerless to aid a party

---

[3] The Majority Opinion refers to the requirements which are made specific statutory conditions precedent to the action of the Attorney General when he exercises his "discretion". These are not conditions precedent to the filing of ordinary lawsuits, but Congress prescribed them here because of the disastrous effect of multiple seizures in this field. The Congress in years of debate chiefly about these multiple seizure provisions recognized that multiple seizures are not ordinary lawsuits. The materials before the Attorney General and the discretion he exercises in making his decision to institute multiple seizures are all different from those involved in an ordinary lawsuit filed by the Attorney General under his ordinary discretion. See point 3 *infra*, pp. 8-9.

who has been and is threatened with irreparable injury and damage by arbitrary and capricious action constituting a gross abuse of discretion by the Attorney General of the United States.

2. There is No Review of Probable Cause Determinations by Libel Courts.

It is clear that this Court is of the opinion that Petitioner will eventually be afforded that full and requisite hearing which due process demands for the Majority Opinion states in part:

> "This highly selective manner in which Congress has provided for judicial review reinforces the inference that the only review of the issue of probable cause which Congress granted was the one provided in the libel suit."

But can a review of the issue of probable cause be had in the libel suit? Under the statutory scheme the *sole* issue involved in the libel suit is as to whether Petitioner's labeling is "misleading in any particular." [§ 502(a)]. There is no issue as to whether Petitioner's labeling is *materially* misleading *to the injury or damage of the purchaser or consumer* as determined *ex parte* by Respondents so that multiple seizures can be made, or whether Respondents were not justified in making multiple seizures because arbitrary and capricious in making their *ex parte* determinations or in the manner and number of seizures made. Is there a marked difference between these two issues? Congress itself has given us the answer to this question. A single libel suit is authorized to be brought where the labeling of a product is *misleading in any particular*. But the *sine qua non* of multiple libels is that the Administrator must first determine from "facts found" that the labeling of the product is *misleading in a material respect to the injury or damage of the purchaser or con-*

sumer.[4] Multiple libels are prohibited unless and until this latter condition is met. Congress, recognizing the disastrous effect which multiple libels, as opposed to a single libel, will have upon a business, has thereby intended to make it more difficult for Respondents to institute multiple libels than to institute a single libel. An administrative determination is found to be required as a "necessary prerequisite to multiple seizures." (p. 4 slip opinion).

This Court seems to be of the belief that the question as to whether that prerequisite condition has been arbitrarily determined through an abuse of discretion and whether the seizures were made in such a manner and number as to constitute arbitrary destruction is an issue in a subsequent libel suit. How could the libel court determine whether or not Respondents made their determinations of probable cause in an arbitrary manner and instituted multiple suits through a clear abuse of discretion when Respondents are not nor could they be made parties to the libel suit? Not only are the United States and Petitioner's product the only parties to the libel actions but the Respondents are beyond the reach of the process of any of the libel courts.

To show in the libel action that the probable cause decision emanates from arbitrary, capricious, unlawful and oppressive actions may well aid in convincing a libel court and jury that the Government's attack on the labeling is entirely without foundation, but the libel court in all jurisdictions outside of the District of Columbia will be powerless to grant equitable relief to prevent irreparable injury from such usurpation of power by joining the Respondents as parties. By making no seizures in this District Respondents foreclose all possible remedy.

An ineffective hearing is no hearing at all. A statutory review which provides no adequate remedy is no review. An ultimate victory in the libel courts under the unusual

[4] The claim in the libel papers in the cases filed against Petitioner is that Petitioner's labeling is misleading, *not* that it is misleading to the injury or damage of the purchaser or consumer.

facts of this case would indeed be a hollow triumph as Petitioner's business will have been arbitrarily destroyed before such a case can be tried. In the past equity has always been allowed to furnish a remedy to meet such a situation but in the majority opinion this traditional jurisdiction is denied. It is respectfully submitted that the statute thus interpreted violates the Due Process clause.

3. Seizure Actions Erroneously Treated as Ordinary Lawsuits.

That this is not an ordinary case can hardly be disputed. The conduct of Respondents found to be arbitrary, capricious and oppressive herein is not believed to be the way most Federal officials treat those subject to their statutory powers. In analyzing the effect of multiple seizure actions, the Majority Opinion has erroneously drawn a comparison with and applied principles applicable to the institution of ordinary judicial proceedings. As already stated herein, the statute here is unique in its prescribed conditions precedent to multiple seizures. Baseless multiple seizures by their very nature are not akin to an ordinary judicial proceeding. This fact is well-established in this case (Fdg. 39, R. 769) and by the Congressional history where in years of heated debate over the multiple seizure provisions the Congress repeatedly so stated.[5] Here the impact upon Petitioner's business is final and irrevocable long before any possible trial on the merits. True, the institution of other proceedings may have serious impact. Multiple seizures on a nationwide basis, however, are not only serious in impact but actually sound the "death knell" of a business engaged in the food supplement field because of the unusual public reaction to governmental action. This is particularly so here where the multiple seizures were deliberately lo-

[5] Cavers, *The Food, Drug and Cosmetic Act of 1938—Its Legislative History and Its Substantive Provisions* (1939) 6 Law and Contemporary Problems 2, 13.

cated and planned by Respondents in order to put Petitioner out of business before any trial on the merits.

Upon this Congressional and factual record it is respectfully submitted that the safeguards created by the Congress should not be casually scuttled by treating multiple seizures as ordinary lawsuits and referring those who complain about violation of the safeguards provided in the Act to libel Courts which are helpless to do anything about such violations.

The Majority Opinion has drawn an analogy between a probable cause determination from "Facts Found" under the Act and the action of a grand jury in returning an indictment. However, the differences are obvious. How can an indictment by a grand jury composed of unbiased private citizens be compared to the determinations of these biased administrative officials found by the Trial Court to be deliberately bent on destroying a business which is not violating the law in any respect? Furthermore, the action of a grand jury only authorizes *one criminal suit*, not multiple suits and seizures throughout the Nation. The fact that the only unbiased body to pass upon the position of Respondents herein held they were 100% wrong warrants consideration.

After erroneously concluding that the eleven seizures are no different from ordinary lawsuits, the Majority Opinion states:

> "Consolidation of all the libel suits so that one trial may be had is the relief afforded the distributors of the articles."

Without wishing to belabor the point, Petitioner submits that the Majority Opinion misconceives Petitioner's claim. The question which is the heart of this case is not that of *multiple trials* or even *a trial* but rather the fundamental fairness of *nationwide seizures* instituted for the specific purpose of putting Petitioner out of business before any possible hearing on the merits in any libel Court. Con-

solidation is a purely fictional and illusory remedy for it does not avoid seizures. Furthermore, consolidation does not offer any guarantee from other seizures after consolidation of those filed originally. It is no remedy at all against the multiple seizures threatened herein to destroy Petitioner. To hold otherwise is to substitute fiction for fact.

4. Under the Test Prescribed by the Majority Opinion the Attorney General Has Violated His Congressional Mandate.

The Majority Opinion holds that probable cause determinations under § 304(a) "from facts found" are a jurisdictional condition precedent to the exercise by the Attorney General of discretion to make multiple seizures. The Opinion cites the determinations of Crawford, Larrick and Dunbar as the basis of the multiple seizures made by the Attorney General. These determinations were held to be *unlawful* and *void* by Judge Pine of the United States District Court for the District of Columbia on January 24, 1949, because the named persons had no legal authority to make such determinations. (Fdg. 34, R. 767). The Attorney General did not appeal that decision.

The Majority Opinion does not mention the later determinations of Kingsley, Acting Administrator, but it does not disagree with the findings herein, holding that those determinations were also void since Kingsley acted arbitrarily and capriciously with the only facts before him being those in a survey made by Respondents which found Petitioner's labeling *not* misleading.

This means that the multiple seizures to date have all been held to be null and void as the Attorney General did not comply with the "statutory prerequisite" before he made them. It is these void seizure actions whose prosecution the lower Court enjoined. Since the determinations of Kingsley could not be a "prerequisite" to the multiple seizures already carried out before his determinations were

made, the major question before the special three judge Court related solely to the threats of future seizures on the basis of Kingsley's determinations.

Therefore, the Attorney General has never acquired a valid probable cause determination to use as what the Majority Opinion calls his "necessary prerequisite to multiple seizures"—the thousands of seizures he threatens to make so as to destroy Petitioner's "business prior to any possible adjudication of the disputed issues . . . in any of the libel actions" (R. 769-70).

Since the Majority Opinion states that ". . . the administrative . . . finding is merely the statutory prerequisite to the bringing of the law suit" it would seem that a court of equity acting under its inherent powers and the Administrative Procedure Act should be able to stop the Attorney General's violation of this specific Congressional mandate. What good is the mandate if there is no judicial power to enforce it and thus prevent the very type of injury which the Congress had in mind in writing it into the law? This is particularly emphasized when, as here, consideration by the libel court comes too late to stop the irreparable injury here inflicted and threatened. Only equity can aid, and it is respectfully submitted that equitable jurisdiction should not be denied under these circumstances.

5. Petitioner's Case Is Not Fairly Judged by What May Happen in Hypothetical Cases.

A major foundation stone of the Majority Opinion is the reference to hypothetical cases involving misbranded articles "dangerous to health" and "fraudulent" labeling and it is said "What we do today determines the jurisdiction of the District Court in all the cases in that category."

The reasoning of the Majority Opinion would appear to assume that whenever a suit to enjoin multiple seizures is filed in the District Court, injunctive relief will immediately be forthcoming and the action of the administration stayed.

Petitioner submits that only under the most unusual circumstances would a District Court grant relief in such a cause. If the circumstances are similar to those involved here (and thus reveal administrative action far beyond the fair limits of proper discretion) then fundamental fairness inherent in due process demands that relief be granted. It is difficult to believe the District Courts will make erroneous decisions by not distinguishing the hypothetical cases relied upon by the Majority Opinion and cases like the instant one.

Should this Court tell the Attorney General and his co-respondents that 'arbitrary,' capricious and oppressive action, such as this record shows, will not be tolerated, there will never be another case like this one. They will stop such abusive action and this Court will not have occasion to consider a multitude of similar cases. Placing the Attorney General above and beyond all judicial restraint on the abusive usurpation of power as found in this unique case encourages further excesses. To foreclose forever any *real* remedy against baseless multiple seizures which are solely designed to destroy a business rather than protect the public, places in the hands of the Respondents an unstoppable destructive power unparalleled in the history of this Republic.

Conclusion.

The Majority Opinion eliminates the due process question by giving a review of the *ex parte* probable cause determinations in the libel courts and answers the equitable relief plea by finding that the Attorney General has an unrestrainable power to make multiple seizures no matter how arbitrarily and capriciously he may abuse his "discretion" and no matter how great the irreparable injury therefrom. This is the most far reaching decision ever handed down in the field of administrative law as it gives administrative officials with general powers the right to abuse these powers and destroy private business while at the same time it confers upon them the power to ignore the specific statu-

tory protection provided by the Congress to prevent the exact type of arbitrary and capricious action complained of herein.

This Court has not disputed the correctness of the facts found by the lower court so that they stand unchallenged, and are an almost unbelievable example of Government by arbitrary official action. Nor will the shock which these facts produce upon the American sense of justice be softened one whit by technical jurisdictional considerations based upon "discretion" and "inference" as to Congressional intention from silence.

It is earnestly submitted that if it is held that the courts of the United States are powerless to intervene against an executive agency of the Government in the present situation, then the judiciary has by its own choosing surrendered a substantial part of its traditional power to redress wrongs committed by the Government against its citizens.

It is all the more remarkable that the judiciary should choose to divest itself of this power when the very same officials who are accused have repeatedly urged that if the accusations were proved the Court had the necessary power to grant relief against them.

"The court has jurisdiction to decide if the Administrator acted arbitrarily." (R. 7) "If he has abused his power by acting illegally or capriciously, then, of course, this Court has the power to enjoin him from doing it." (R. 9) "Of course, the Court can decide whether they have acted illegally or arbitrarily. . . ." (R. 295) While these and other such statements to the Court below by the Respondents did not and could not confer jurisdiction upon the Court if none existed, these statements of Respondents' Counsel illustrate that so basic was the agreement and understanding of the Court and the parties below, that the Court had the power to act if the facts were proved that it was not even questioned.

If this Honorable Court is inclined to repudiate the principle announced by the Court in *Monongahela Bridge Co.* v.

United States, 216 U. S. 177 that "the courts have rarely, if ever, felt themselves so restrained by technical rules that they could not find some remedy, consistent with the law, for acts, whether done by government or by individual persons, that violated natural justice or were hostile to the fundamental principles devised for the protection of the essential rights of property," it is urged that the Court first afford Petitioner the opportunity to present to the Court reasons why it should not do so. The unrepresented thousands who must come in contest with government officials in the future who threaten to destroy them by arbitrary action have a vital stake in the action taken by this Court on this petition. For if this Petition is denied, Federal courts of equity will have lost their traditional power to prevent irreparable injury from arbitrary action of Federal officials even where, as here, the Congress thought it was leaving this power undisturbed.

Petitioner urges that the position taken by the Respondents that the lower court did have the requisite jurisdiction to enjoin them if they were guilty of arbitrary action is sufficient reason to justify Petitioner's request, the granting of which will allow the Court for the first time in the proceeding the benefit of a full discussion of this specific jurisdictional issue.

For the reasons set forth herein it is most respectfully submitted that this petition should be granted.

Respectfully submitted,
